This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

THE PENNY CYCLOPÆDIA

OF

THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

SIGONIO, CARLO, was born at Modena, about the year 1520. He was a pupil of Franciscus Portus, who taught him Greek. He afterwards studied medicine and philosophy at Bologna, and he also visited the university of Pavia. In 1546 he was invited back to Modena to fill the chair of Greek literature, which had become vacant by the departure of Portus. In 1552 he accepted the chair of belles-lettres at Venice, where he became acquainted with Panvinio, who, like himself, was a diligent student of antiquity. His reputation having become widely spread by various works on classical antiquity, he had invitations both to Rome and Padua, at which latter place he accepted the chair of eloquence in 1560. At Padua he again met with Robortello, with whom he had already had a dispute on the names of the Romans, and the disputes between these two scholars, being renewed, were carried to such a pitch that the senate of Venice found it prudent to silence the combatants. [ROBORTELLO.]

Sigonio left Padua in the year 1563 for a place in the university of Bologna, where he received a handsome salary, and was made a citizen. His reputation attracted numerous students to Bologna. Roman antiquity was his special subject, and his instruction was characterised both by comprehensiveness and accuracy. He also occupied himself with middle-age history, and with this object he visited the great libraries and collections of Italy. It was at the request of Pope Gregory XIII., in 1578, that he commenced the ecclesiastical history, of which his friend Panvinio had formed the plan. Sigonio having discovered some fragments of Cicero's treatise 'De Consolatione,' undertook to restore the work, which he completed and published as a genuine work of Cicero. The fraud was detected and exposed by Riccoboni, one of his pupils; but Sigonio, instead of confessing the fact, endeavoured to reply to the arguments of his opponent; and so well has he succeeded in imitating the expression and manner of Cicero, that the work 'De Consolatione' long passed for genuine, notwithstanding the criticism of Riccoboni; and Tiraboschi, who maintained this side of the question, was only convinced by seeing some unpublished letters of Sigonio, in which he acknowledges himself to be the author. Sigonio retired to the neighbourhood of Modena, where he died in 1584. His numerous writings were collected by Argelati, Milan, 1732-1737, in 6 vols. folio, to which is prefixed a Life by Muratori. All his works on matters of antiquity are also contained in the 'Thesaurus Antiquitatum Graecarum et Romanarum' of Graevius and Gronovius.

The following, which are among the principal works of Sigonio, will indicate the general character of his labours: 'Regum, Consulum, Dictatorum ac Censorum Romanorum Fasti, una cum Actis Triumphorum a Romulo rege usque ad Tiberium Caesarem; in fastos et acta triumphorum explicationes,' Modena, 1550, fol.: there is also a second edition of this work, Venice, 1556; 'De Antiquo Jure Civium Romanorum Libri Duo; de Antiquo Jure Italiae Libri Tres; de Antiquo Jure Provinciarum Libri Tres,' Venice, 1560, fol.; 'De Republica Atheniensium Libri Quatuor; de Atheniensium et Lacedaemoniorum Temporibus Liber Unus,' Bologna, 1564, 4to.; 'De Judiciis Romanorum Libri Tres,' Bologna, 1574, 4to.; 'De Occidentali Imperio Libri xx., ab anno 281 ad 575,' Bologna, 1577, fol.; 'Historiae Ecclesiasticae Libri xiv.;' this work comes down to the year 311, but it was the intention of the author to continue it to 1590.

Sigonio was one of the great scholars to whom we owe much of our knowledge of antiquity, and particularly of Roman history. His industry was unwearied, and his learning was sound and comprehensive. He wrote the Latin language with ease and correctness, and his style is simple and perspicuous. Modern scholars have often been more indebted to Sigonio than they have been willing to allow, and the results of his labours have been used by one person after another, and sometimes without making any discrimination between what is right and what is wrong. Heineccius was largely indebted to him, as will appear from examining his 'Syntagma.' If we consider what was done before his time and what he accomplished towards the illustration of Roman antiquity, we shall find few scholars who have so well deserved a lasting reputation. It would require a minute investigation to ascertain how far some of the more recent views of the Roman polity have been suggested by the writings of Sigonio. His remarks on the Agrarian laws, though far from being marked by sufficient clearness and precision, are still worth reading. (*De Antiquo Jure Italiae.*)

SIGUENZA, a large town of the province of Guadalaxara in Spain, situated on the declivity of a hill near the source of the river Henares, in 40° 58′ N. lat. and 2° 57′ W. long. It is the see of a bishop, suffragan of Toledo, and has a university, which was founded in the year 1441. The town is badly built; the streets are narrow and crooked, but clean. Of the numerous ecclesiastical buildings which the town contains, the cathedral is the only one worthy of mention. It was built at the beginning of the fourteenth century, in the pure Gothic style; it contains one nave and three aisles, and measures 220 feet by 112. One of its chapels, that of Santa Catalina, is greatly admired for its large dimensions and the beautiful marble tombs which it contains. Siguenza is the antient Segontia, mentioned by Pliny (iii. 3) as one of the six towns among the Arevaci in Hispania Tarraconensis. Livy (xxxiv., 19) calls it Seguntia; and in the 'Itinerary' of Antoninus it is mentioned as Segontia. Inscriptions bearing the latter name have been found in the neighbourhood. It was the seat of a contested battle between Pompey and Sertorius. In 1106 Alfonso VI., king of Leon and Castile, wrested it from the Moors, who had occupied it since the beginning of the eighth century. An antient castle which commands the town is the only remain of Mohammedan architecture. The population, according to Miñano (*Diccionario Geografico, &c.*), was about 20,000 in 1834. The only trade of the place consists in coarse flannels, blankets, and hats, which are exported to Toledo and Guadalaxara.

SIKE or **SIECKE, HENRY**, an Oriental scholar of some repute, who lived in the latter half of the seventeenth and the beginning of the eighteenth centuries. He was a native of Bremen, and a professor of Oriental languages at Utrecht, and afterwards at Cambridge. It appears that owing to some misdemeanor he was to be subjected to punishment; and in order to escape from this disgrace, he put an end to his life by hanging himself in 1712. The only work of any note which he published is the 'Evangelium Infantiæ Christi, adscriptum Thomæ,' 1697, 8vo., a very curious apocryphal gospel. It is reprinted in Fabricius's 'Codex Apocryphus Novi Testamenti,' tom. i., pp. 127-212. Sike also founded with L. Küster, at Utrecht, the literary periodical called 'Bibliotheca Novorum Librorum,' to which he contributed several papers.

(Saxii *Onomasticon Literarium*, v., 490, &c.)

SIKHS. [HINDUSTAN, p. 233.]

SILBURY HILL. [WILTSHIRE.]

SILCHESTER. [HAMPSHIRE.]

SILENA'CEÆ, a natural order of plants, belonging to the syncarpous group of the Polypetalous subclass of Exogens. This order is a part of the larger order Caryophylleæ [CARYOPHYLLEÆ] of Jussieu, and was originally separated by De Candolle. It has since been adopted by Bartling and Lindley in their systematic works. It differs from the remaining portion of the order Caryophylleæ, which are now called Alsinaceæ, in the possession of a tubular calyx, and petals with claws.

SILE'NE, the name of an extensive genus of plants belonging to the natural order Caryophyllaceæ. It is known by its having a tubular, naked, 5-toothed calyx; 5 bifid unguiculate petals, which are usually crowned in the throat with 5 bifid scales; 10 stamens; 3 styles; capsules 3-celled at the base, ending in 6 teeth at the apex. The species are in general herbaceous, many of them are annual, very few shrubby. Their stems are leafy, jointed, branched, and frequently glutinous below each joint. The calyx and leafstalks are also frequently viscous. The leaves are opposite, simple, and entire. The petals are mostly red and white, sometimes greenish or yellowish. Some of them give off a delicious perfume, especially at night. The extent of this genus is very great, and constant additions are being made to it by the collections of travellers. The greatest proportion are inhabitants of the South of Europe and North of Africa. Don, in Miller's Dictionary, enumerates 256 species of this genus; of these we shall give a few examples of the more common and interesting forms.

S *acaulis*, stemless Catchfly, or Moss Campion: whole plant glabrous, cespitose; leaves linear, ciliated at the base; peduncles solitary, 1-flowered; petals crowned, slightly notched. It is a native of Europe, and is found abundantly on the Alps. It is found on nearly all the Scottish mountains, and also on Snowdon, and the highest hills of Devonshire. Chamisso also gathered it on the islands of the western coast of North America. The flowers are of a beautiful purple colour, and it forms one of the greatest ornaments of our Alpine flora. Several varieties of this plant have been recorded, varying chiefly in the form and existence of parts of the flower.

S. *inflata*, bladder Campion or Catchfly: stems branched; flowers numerous, panicled; calyx inflated, netted; petals deeply cloven, scarcely any crown; leaves ovato-lanceolate.

This is a very common plant throughout Europe, and is met with in almost every field and wayside in Great Britain. Like most plants that are widely and largely diffused, many varieties of it have been recorded. This plant has been recommended to be cultivated in the garden on account of its edible properties. The shoots gathered young, when about two inches high, and boiled, are a good substitute for green peas or asparagus. They are thus eaten by the natives of Zante, and in 1685 the inhabitants of Minorca are said to have been saved from famine, occasioned by a swarm of locusts, by using this plant as food.

S. *noctiflora*, night-flowering Catchfly: panicles forked; petals bifid; calyx with long teeth, oblong in fruit, with ten connected ribs; leaves lanceolate, lower ones spathulate; whole plant clammy, pubescent. It is a native of Sweden, Germany, and Great Britain; it resembles very much the common red and white campion (*Lychnis dioica*). It is not a common plant, and is remarkable for opening its flowers at night only, and in warm weather, when they exhale a powerful and delicious scent.

S. quinquevulnerata, five-wounded Catchfly. stems branched; leaves lanceolate, lower ones obtuse; calyx very villous, with short teeth; petals roundish, entire, with toothed appendages. The petals of this plant are of a deep crimson with pale edges, giving them the appearance of having been stained with blood in the centre; hence their specific name. It is a native of Spain, France, and Italy, and has been found in the county of Kent in Great Britain. It is frequent in gardens, but loses by cultivation much of the colour of its flowers.

S. *muscipula*, Spanish or Fly-trap Catchfly: plant smoothish, clammy; stem erect; branches alternate, long; lower leaves lanceolate, upper ones linear; flowers panicled; calyx clavate, netted; petals bifid. It is a native of Spain, with intensely red petals. It is exceedingly clammy, so that when flies alight on it they are caught; and hence the name Catchfly, which is given to the whole genus, though few of the species possess the property.

S. *fruticosa*, shrubby Catchfly: stem shrubby at the base, much branched, tufted; flowering stems simple; leaves obovate, dark-green, permanent, ciliated, particularly towards the base; flowers crowded; calyx clavate; petals deeply emarginate, obtuse, with 4-parted appendages. This plant is a native of Sicily and of the island of Cyprus, and grows among rocks. It is frequently cultivated in gardens, and makes a handsome ornament.

S. *compacta*, close-flowered Catchfly: plant glabrous, glaucous; stem erect, branched; leaves ovate-cordate, sessile; flowers crowded into dense corymbs; calyx very long; petals entire, obovate, crowned. It is a native of Russia, and very nearly resembles the *S. armeria*, but is distinguished by its entire petals. It is one of the most beautiful of the genus, and deserves a place in every collection of flowers.

In the cultivation of the species of Silene no great art is required. The hardy kinds may be planted in the open border, and the smaller species are well adapted for rock-work. The seeds of the hardy annual kinds may be sown in the beginning of the spring, where they are to remain. The perennial kinds are best increased by dividing them at the roots in the spring. The greenhouse kinds thrive best in a rich light soil; the cuttings of shrubby species should be placed under a hand-glass.

SILE'NUS (Σειληνός), a Greek deity. The traditions of his birth are various: he is said to be son of Pan, of a nymph, of the earth, and to have sprung from the blood of Uranus. He was the instructor of Bacchus, a lawgiver and prophet, sometimes confounded with Bacchus himself, of the family of Satyrs, whom he resembled very much in appearance and habits. He is represented as an old man, bald, with a beard, and depressed nose, sometimes with a tail, at times holding the infant Bacchus in his arms, or with a wine-skin on his shoulders. He has a conspicuous place in the Bacchic chorus, and occurs in various combination with fauns and nymphs. Though endowed with supernatural wisdom, he is of a comic disposition; his whole character is a mixture of jest and earnest; he is harmless, sportive, fond of children, addicted to wine; sometimes he rides on his ass reeling and supported by a satyr; is said to have conducted Bacchus from Thrace to Phrygia; and to have been ensnared by Midas in a garden, and compelled to exert his marvellous power of speech. His discourse was of the second world, of the land of Meropis, and of its strange men, beasts, and plants, of the origin of things and birth of the gods, and he showed the miserable condition of this present life. In all that he uttered was an irony consistent with his motley character. The ass by which he is accompanied has given rise to many conjectures; the Bacchic myths and those of Apollo speak of this animal as sacred to both deities. It may therefore be considered as the link uniting the two worships, and we find accordingly Apollo called the son of Silenus. (Porphyry, *Vit. Pythag.*, p. 10, ed. Rome, 1630.) Attempts have been made by Bochart and others to connect Silenus with the name Shiloh in Scripture, and his ass with that of Balaam. Other imaginary resemblances are noticed by Creuzer (*Symbolik*), founded on the theory that the ass is the symbol of prophecy in the East. The myth of Silenus has been further thought by Creuzer to have reference to cosmogony. He quotes Porphyry (Euseb., *Pr. Ev.*, iii., p. 110, Cologne, 1687) in support of this opinion, and considers Silenus as 'the half-embodied soul of the universe, the struggle of the shapeless into shape, or, to speak physically, the moist breath which, according to the Egyptian and old Ionian philosophies, nourishes the stars.'

This theory is made still further to interpret the connection between Silenus and Bacchus, and the various modes in which he is represented on antient monuments: the arguments on which it rests are however too numerous and intricate to be here entered upon.

The distinction between Sileni and Satyrs does not appear very clearly made out. According to authorities quoted by Creuzer, the Sileni are the older of the two. The terms were certainly not co-extensive; that of Satyr may be considered as the genus. They were mostly represented in the same manner, with beards, tails, and pricked ears like beasts. In the procession of Ptolemy Philadelphus (*Athen.*, v. 197) they were dressed differently from each other, and the Sileni have sometimes a more human form. See Creuzer's 'Symbolik,' and Grüber's 'Worterbuch der Mythologie,' for representations of Silenus; Millin's 'Galérie Mythologique,' and the various works on gems, sculpture, vases, and other monuments of classical antiquity.

SILESIA. This country, which is now divided between Prussia and Austria, was once inhabited by the Lygii and Quadi, who, in the sixth century, were forced to yield to the pressure of a Slavonian tribe from Poland, by which event Silesia became subject to that country. Under the dominion of Poland, the Polish language and manners, which still remain in the eastern parts of the province, and the Christian religion, were introduced. To promote the latter a bishopric was founded in 906, at Schmogor, which was afterwards transferred to Breslau. The country being in course of time divided and subdivided among the descendants of Boleslaus III., king of Poland, numerous small principalities arose. Being weakened by these divisions, and by the dissensions between the princes, it was subdued by the king of Bohemia in the fourteenth century. Under the dominion of Bohemia the doctrines of Huss, Luther, and Calvin gained ground, and their adherents obtained the partial exercise of their religion. With the Polish princes Polish manners and customs disappeared; everything was placed on the same footing as in Germany; trade, manufactures, arts, and sciences flourished. The prosperity of the country would have been greater in former times, had not the Protestants been so much oppressed under the Austrian government. Austria, which obtained possession of Silesia, together with Bohemia, in the early part of the sixteenth century, retained it undisturbed till the death of the emperor Charles VI. in 1740, on which Frederic II. of Prussia revived a dormant claim to the western part of Silesia, which he immediately invaded; and the greater part was ceded to him in 1742, and confirmed to him by the treaties of Dresden, in 1745, and of Hubertsburg, in 1763. Austria retained the smaller portion.

SILESIA (in German, *Schlesien*), the Prussian Province of, is situated between 49° 40′ and 52° 8′ N. lat., and between 14° 25′ and 19° 15′ E. long. It is bounded on the north-west by Brandenburg; on the north-east by Posen; on the east by Poland; on the south-east by Cracow and Galicia; on the south by Austrian Silesia; and on the south-west by Bohemia. Including the county of Glatz, and the Prussian part of Upper Lusatia, its area is 15,600 square miles. The province is 210 miles in length from north-east to south-west, and from 70 to 80 miles in breadth from east to west. The river Oder, which becomes navigable soon after entering the Prussian boundary, divides the province in its whole length into two nearly equal parts, which are very different from each other. That on the left bank, which is called the German side, is mountainous, but has a very fertile soil, which amply rewards the labour of the husbandman, and supplies almost the whole province. That on the right bank, called the Polish side, is very different; it consists chiefly of a sandy and not very fruitful soil. There are however some sandy tracts on the German side, and some rich and productive spots on the Polish side. The country is highest on the south-eastern frontier, and declines more towards the north-western frontier, where it is the lowest.

Where the frontiers of Silesia and Bohemia meet, a mountain-chain rises, which extends southwards to the sources of the Breswa and the Ostrawitza, where it joins the Carpathians, divides the basin of the Oder on the one side from those of the Elbe and Danube on the other, and forms the natural boundary between Silesia and Bohemia and Moravia. This chain, called by the general name of the Sudetic chain, is divided into different parts, bearing different names, as the Isergebirge, the Riesengebirge, the loftiest and wildest part of the whole chain, the Schneekoppe, which is 4950 feet above the level of the sea, the Glatz Mountains, &c. In the interior there are some ranges unconnected with the great chain—the principal of which is the Zobtengebirge, 2318 feet above the level of the sea. On the right side of the Oder, from the part where its course is to the northward, the high land disappears, and those immense plains begin which characterise this part of Europe. The Oder, called by the common people the Ader, that is, 'the vein,' comes from Moravia, and receives all its rivers, with the exception of some on the frontiers. The principal are the Elsa, the Klodnitz, the Slober, and the Bartsch, on the right side; the Oppa, the Neisse, the Ohlau, and the Katzbach, on the left. There are few lakes, and those which are so called are rather large ponds. The largest are the Koschnitz, Moswitz, and Schlawer lakes. The last is however four miles in length, but nowhere above a mile in breadth. The climate varies very much in the different parts of the province. The air on the whole is very mild, except in the mountainous tracts; but in proportion as we approach the southern frontier, the temperature becomes lower, and the winter longer and more severe, which is owing to the elevation of the country, to the extensive forests, and partly to the lofty Carpathians and the winds that come from them.

Natural Productions.—The animals are—horses, horned cattle, sheep, goats, swine, game, fish, bees, and domestic poultry. Wolves are found on the Zobtengebirge, otters in the Bober, and sometimes beavers in the Oder. The vegetable products are—corn, pulse, garden vegetables, fruit, flax, tobacco, hops, madder, woad, teazle, and timber. The minerals are copper, lead, cobalt, arsenic, iron, and zinc. This last metal is found in Silesia and in the adjoining republic of Cracow in far greater quantities than in any other country in Europe. Other mineral products are sulphur, marble, alum, lime, and, above all, coal, of which from two millions to two millions and a half tons are annually obtained, which are worth from 100,000*l.* to 130,000*l.* sterling.

Though Silesia is on the whole one of the most fertile and best-cultivated provinces of the Prussian monarchy, and produces much corn, so that in good years it can export a portion to Bohemia, yet, as it is very densely populated, it has not sufficient in unfavourable years for its own consumption, and is obliged to import. The cultivation of potatoes has become much more general of late years.

The manufactures of Silesia are of the greatest importance, and that of linen has existed from a very remote time. It is carried on with little aid from machinery, and chiefly by the country-people, though this branch of industry affords them but a scanty subsistence; it is however their chief occupation. Dieterici says:—'A third part of all the looms at work in the Prussian dominions, viz. 12,799 out of 36,879, is in Silesia. The linen annually manufactured in Silesia is estimated at between eight and nine millions of dollars (1,333,000*l.* to 1,500,000*l.*).' Uncertain as such estimates are, the quantity exported may be assumed to be worth between three and four millions of dollars. Woollen cloths are manufactured in some towns, and cottons at Reichenbach. There are sugar-houses in several places; tanneries at Breslau and Schweidnitz, and breweries and brandy-distilleries in most of the towns. With respect to spinning and weaving, we may observe that machinery is beginning to be introduced into some larger manufactories. The population of the province, which at the end of 1837 was stated at 2,679,473, had increased, at the end of 1840, to 2,868,820. They are mostly Germans, and some Slavonians of Polish origin. About half the inhabitants are Protestants, and the remainder Roman Catholics, besides about 18,000 Jews: all have the free exercise of their religion. The province is divided into the three governments of Breslau, Oppeln, and Liegnitz; and has twenty towns with above 5000 inhabitants, as noted in the statistical table in the article PRUSSIA. All the most important of these towns are described under their respective heads.

AUSTRIAN SILESIA is that part of the province which was retained by Austria in the treaty of Hubertsburg in 1763. It is united with Moravia, with which it forms one province. It is bounded on the north-west, north, and north-east by Prussian Silesia, on the east by Galicia, on the south by Hungary and Moravia, and on the south-west by Moravia. The area is about 1750 square miles, with 430,000 inhabitants, who are partly of German and partly of Slavonian origin. Next to the kingdoms of Lombardy and Venice, it is the most densely peopled part of the Austrian dominions

The country is mountainous, and on the south-east are the Carpathians (of which the Sigula is 4300 feet high), and on the north-west the Moravian-Silesian chain, a branch of the Sudetes. Near the Carpathians, and about the source of the Oppa and the Mohra, the climate is cold, and the mountains are partly covered with snow till the middle of June. The southern part of the circle of Teschen is not fruitful, the soil being stony; in other parts it is better. The principal rivers are the Oder, with its tributaries the Oelsa and the Oppa; the Vistula (in German, the Weichsel) rises on the north side of the Carpathians from three sources, called the Little, the White, and the Black Vistula; this last rises in the village of Weichsel, at the foot of the Tankowberg, which village gives its name (Weichsel) to the whole river.

The inhabitants have a very good breed of horses, and of oxen, and especially a very improved breed of sheep. They are very skilful and industrious farmers. The manufactures, especially those of linen and woollen cloth, are very important. The exports are linen, thread, woollen cloth, wire, paper, earthenware, cheese, flax, rosoglio, &c. The transit trade is very profitable: the chief articles are Hungarian and Austrian wines, Russia leather, tallow, linseed, and furs; Galician rock-salt, Moldavian oxen, Vienna fancy-goods, &c. [Moravia; Teschen; Troppau.]

SILEX. [Silicium.]

SILHET, or SYLHET, is a district of Bengal, lying along its eastern border, on the east side of the Megna, as the lower course of the Brahmapootra is called. Up to the year 1830 it consisted only of what must now be called Silhet Proper, or a country situated between 24° and 25° N. lat., and 91° and 92° 30′ E. long., which, according to the most recent information, contained about 4500 square miles, and a population of 1,083,120, which gives 241 to the square mile. It is about 1300 square miles less than Yorkshire, but more populous, as Yorkshire, in 1831, did not contain more than 235 persons to the square mile. In 1830 the royal family of Kasbar, a country east of Silhet, became extinct; and a few years later the raja or sovereign of Jyntea, a country north of Silhet, was obliged to give up his territory to the British, and both countries were annexed to Silhet. These two countries taken together are at least three times as large as Silhet Proper, and the district at present contains about 18,000 square miles, or two-thirds of the area of Ireland. Silhet, in this extent, lies between 24° 10′ and 26° 20′ N. lat., and between 90° and 94° E. long. On the west it borders on Bengal, on the district of Mymansing, and on the mountain-region of the Garrows; on the north on Asam, on the east on Muneepoor, and on the south it is bounded by the unknown region called the Tiperah Mountains or Wilderness. It is only towards Muneepoor that it has a natural boundary, which is formed by the course of the river Barak, where it runs from south to north, east of 93° E. long., and by two of its confluents, the Jeeree, which joins it from the north, and the Tooyaee, or Chikoo, which falls into it from the south.

Surface and Soil.—Silhet is naturally divided into two regions. The northern part is a mountain region, which extends along the southern boundary of Asam, and divides that large vale from the valley of the Barak, which river, as far as it drains Silhet, runs through a wide valley that constitutes the low and level portion of Silhet. The mountain region comprehends about two-thirds of the country, or 12,000 square miles, and the plain about one-third.

The *Mountain Region*, of which Silhet now comprehends nearly one-half, extends along the southern border of Asam, and at its most eastern extremity, near 97° E. long. and 28° 40′ N. lat., at the sources of the Lohit river, or Brahmapootra, it is united to the high table-land of Central Asia. Its western extremity comes close to the Brahmapootra, where this river, after leaving Asam, forms its great bend to the south (90° E. long.). The western portion of this extensive mountain region is called the Garrow Mountains, which are considered to extend eastward to the river Patli, which, traversing the mountain region in a southern direction, joins the Soorma near the town of Laour (91° 10′ E. lat.). The most western offset of the Garrow Mountains skirts the banks of the Brahmapootra, between the mouth of the river Lalu and the village of Mahendragandj, a distance of about twelve miles. Along the banks of the river the mountains are merely rocks, from 150 to 200 feet above the level of the river, rising with a steep ascent. They are called the Caribari Rocks, from a small town situated somewhat to the south of their southern termination. But in proceeding farther east, the mountain-mass rises gradually in elevation, and occupies a greater breadth. In 90° 20′ E. long. it has attained a general elevation of more than 2000 feet above the sea-level, and occupies a width of about 50 miles. We are only acquainted with the outer border of this mountain-mass, where it consists of ridges broken by numerous watercourses, and is entirely covered with trees and dense underwood. Some isolated peaks rise 2000 feet above the general level of the mass. According to information collected from the natives, the interior of this elevated region is nearly a level table-land, destitute of trees, and covered only with grass; and this is probable, as it corresponds to the characteristic features of the mountain region farther east. Only the lower portion of the Garrow Mountains is subject to the British, and united to the three divisions of Bengal, Rangpoor, Mymansing, and Silhet. The interior, called Gonaser, or Ganeswara, is occupied by the Garrows, a mountain-tribe which has never been subjected by the princes of Bengal, as the country is only accessible by long and winding mountain-passes, which are so narrow as to be impracticable for horses or other beasts of burden: they are properly only paths over rugged crags, and along steep precipices, and through extremely narrow gorges. From these fastnesses the Garrows make incursions into the adjacent countries, and hence several tracts of some extent along the boundary of their country have been entirely abandoned. They cultivate rice, millet, and cotton, and use as food several plants which grow wild in the forests, as different kinds of arum, caladium, and dioscurias. They cultivate capsicum, onions, and garlic. They keep cows, goats, hogs, and eat cats, dogs, foxes, and snakes. Different kinds of deer are said to be common in Gonaser.

Adjacent to Gonaser on the east, and only separated from it by the river Patli, is the mountain region of the Kasias (Cossyas), which extends eastward to the river Kopili, an affluent of the Deyung, which falls into the Brahmapootra. This mountain region runs above 100 miles east and west, between 91° 10′ and 93° E. long.; and in proceeding eastward it gradually enlarges in breadth from 50 miles to about 70 miles. This portion of the mountain region is much better known than Gonaser, being subject to the British, who have traversed it at two places in passing from Silhet to Asam, and who have erected on it several sanatory stations, among which that of Chirra Punji is very much frequented. The western road leads from Pondua in Silhet, through Chirra Punji, Moiplong, Lombray, and Nungklao, to the banks of the river Kailasi, an affluent of the Brahmapootra, and to the low land of Asam. The traveller, passing by a steep ascent over four ridges, arrives at Chirra Punji, which is 5000 feet above the sea-level. Here begins a table-land, the surface of which is often level, but generally exhibits very gentle slopes, which continues to Nungklao. The most elevated points are at Moiplong (5942 feet) and Lombray (5914 feet). At Nungklao it is only 4550 feet. North of the last-mentioned place it sinks by three wide terraces with steep descents to the plain of Asam. The table-land is entirely destitute of trees and bushes, especially in the southern parts. This sterility, as Fisher thinks, is closely connected with the character of the sandstone-rocks of which the mountain-mass is composed, and with the disturbance of the strata, but more especially the latter; for where the strata are horizontal, there is an absence of vegetation, and where the strata are inclined, symptoms of fertility begin to show themselves. Throughout the ascent from the plains of Silhet to Chirra Punji, the vegetation is only dense on the slopes; and where ledges or steppes occur, it is comparatively barren. The table-land itself is covered with a short turf, and there occur only a few bushes, as raspberries; stunted fir-trees only occur in the glens which are formed by the river-courses—as, for instance, in that of the Bogapani. To the north of this river the aspect of the country changes gradually; and though the elevation is greater, the vegetation increases, and continues to increase, until in the vicinity of Nungklao it becomes abundant, though it does not exhibit that excess which prevails farther to the north, on the lower descent of the table-land towards Asam. This change is attributed to the numerous large granite boulders which are scattered in great abundance over the country. The disintegration of these boulders has largely contributed to the formation of the soil, especially where it has been favoured by the configuration of the surface. But in those tracts where tions and the hollows, and the strata preserve their horizontal position, vegetation is deficient. The climate at Chirra Punji is cool, temperate and pleasant, especially between November and March. Neither snow nor frost occurs, but in December and January hoar-frost is very common. The sky is generally clear, but violent showers frequently occur. The almost continual coolness of the air, and the absence of heat, has pointed out this place as a convalescent station. Near Moflong however frost occurs even in November, as the thermometer then descends to 31°. Nunklow has a more pleasant climate. The early part of the summer is not much warmer at that place than in London, as the thermometer ranges between 64° and 74°.

Cultivation appears only on the southern declivity, and in the neighbourhood of Nunklow, where rice is grown in considerable quantity. On the southern declivity of the mountain-region many fruits are cultivated, as oranges, plantains, and the areca palm; and much honey and wax is collected. On the northern declivity, where fir-trees cover large tracts of land, European fruit-trees grow, especially apples, pears, and plums, and also strawberries and raspberries. The eastern road traverses the Kasia Mountains between 92° and 92° 30′ E. long., from the town of Jynteahpoor, the capital of the former kingdom of Jyntea, to Raha Chokey in Assam, situated where the Deyung unites with the river Kullung. The southern edge of the mountain region, which is only a few miles distant from Jynteahpoor, seems to be formed by a ridge which is considerably elevated above the table-land farther north, and which is traversed by the mountain-pass of Mutagot. North of this ridge lies a plain about 2500 feet above the sea-level, whose surface is undulating, and in some parts hilly, but it is covered only with thick grass, without bushes or trees, except that in a few places, and at great distances from one another, small groves of fir or other trees are met with. It certainly might be used as pasture-ground, especially as the climate is very mild; but the few inhabitants say that they are prevented from keeping cattle by their neighbours, who frequently make predatory incursions into their country. The table-land occupies a width of 30 miles along the road. The northern edge is less distinctly marked, and the descent occupies about twelve miles. The nature of the table-land precludes agriculture; but in the northern districts rice is raised in considerable quantity, particularly in the small plains and on the sides of the valleys, where irrigation is practised, water being brought to the fields through narrow canals, and conveyed over hollows and up heights for short distances by means of trunks of trees and bamboos. Rice and yams are cultivated, and a kind of coarse silk called *moongah* is collected on the trees.

That portion of the mountain region which lies east of the Kopili and Deyung rivers, and extends eastward to the river Dunsyng and the boundary of Munneepoor, comprehends Upper Kachar, and is called the Kachar Mountains. It is likewise a table-land, the southern edge of which is marked by an elevated range, which continues to run east to 93° 10′ E. long., where it turns north-east and continues in that direction till it approaches 94° E. long., where it again runs east and stretches into an unknown country. Where this range runs north-east it is called the Burra Ail Mountains, and attains a mean elevation of 6000 feet above the sea-level. It is covered with large trees and light underwood. The southern declivity of the Burra Ail Mountains is very little known, but it seems to be certain that this side of the range is intimately connected with the three ridges which traverse the western portion of Munneepoor, and by running north and south unite the mountain region which we are now noticing with the extensive mountain-system of Tiperah. The ridges are called, from west to east, the Kelbunda, Kohibishing, and Munneepoor Mountains. These chains and their numerous lateral offsets render the western portion of Munneepoor a rapid succession of elevated ridges and deep and narrow valleys. The country which lies north of the Burra Ail Mountains, both near the range and to the distance of 10 or 12 miles, is covered with the high offsets of the range, and has an entirely mountainous character. North of this comparatively narrow mountain-tract the surface of the country is hilly. Most of the hills are isolated, but in some places they form ridges. This hilly tract occupies a width of about 20 miles, and it is followed by a plain. Both the hilly and level country are almost entirely covered with forests. The northern edge of the table-land is marked by a range of low hills, and a gentle descent, the greater part of which seems to skirt the southern banks of the Dunsung, an affluent of the Deyung, the country north of that river constituting a portion of the plain of Assam. It is much more thickly inhabited than the table-land of the Kasia Mountains. A very large portion of it is fit for agriculture, and the small progress that both agriculture and population have made is mainly if not exclusively to be attributed to the unsettled state in which the country has been for a long time, under the sway of petty sovereigns, who were never able to defend their subjects against the incursions of the hill tribes who inhabit the mountains, especially the Angamee Nagas. Some large tracts are quite uninhabited, though the vigorous growth of the trees shows the excellent quality of the soil. But along the large rivers and in their neighbourhood cultivated tracts and villages are numerous, and will increase, since the British have compelled the Angamee Nagas to keep quiet. The inhabitants cultivate rice, and in the valleys of the hilly and mountainous part of the country several kinds of coarser grain are grown; there is also a very fine-flavoured kind of purple vetch. About the villages of the more elevated region there are groves of peach-trees in the most luxuriant state, and the apple-tree grows wild and produces a well tasted fruit. The bay-leaf and a very small kind of mango are also natives of these mountains. Cloth is made of a nettle, which is procurable in great abundance. On the lower hills cotton and chillies are grown as articles of commerce, and in these parts also much wax and honey is collected. The cultivation of the lower and level country resembles that of Assam, being similar in climate and soil, but no part of it is subject to annual inundations.

The Plain.—Along the southern base of the mountain region hitherto noticed there is a plain, or rather a vale, for along its southern side the mountain-system of Tiperah rises to a great height. The length of this vale may be about 120 miles, and the width in the western half about 40 miles on an average, but towards the east it narrows to 30 and even 20 miles, until it is shut up by the Kelbunda range, which lies near the boundary and within the territories of Munneepoor. As to the configuration of its surface and the qualities of the soil, it may be divided into two portions. A line drawn from Chattuc on the Soorma, south-west of Pundua (91° 40′ E. long.), running in a south by west direction east of Tajpur, through Nubiganj and thence to the hills south-east of Turruf near the Tiperah Mountains, very nearly separates these two tracts. The country west of this line is very low and level, and constitutes properly a portion of the lower portion of the plain of Bengal. It is in most parts marshy, and the whole is subject, like the greater part of Lower Bengal, to periodical inundations of long duration, being in general under water from April to the middle of November. These inundations are partly the effect of the heavy rains which fall during the south-west monsoon, and partly of the immense volume of water which is brought down by the rivers during that season, especially by those which drain the mountain system of Tiperah, the Manu, Khowa-hi, and Gogmati. This lower tract is called Bhatia. The towns and villages, which in some parts, especially to the south, are numerous, are built on mounds of earth; huts, temples, mosques, and sheds for cattle are huddled together. When the inundations are at their height, there are from 8 to 12 feet water on the lower grounds. As soon as they have sufficiently subsided, or in the beginning of November, such lands as are high enough for the purpose are sown with rice and millet; the crop is cut in April. The lands yield only one crop. There appear occasionally a little sunn and hemp, with some gourds and cucumbers about the huts. The marshes are however filled with cattle, from which profit is derived sufficient to make the occupation of these desolate tracts desirable. Ghee and cheese are made from the milk of buffaloes and cows, and the upper country, which lies farther east, is furnished with young bullocks for the plough. During the inundations the cattle are confined to the sheds and feed on green fodder brought in boats from the jhils or marshy tracts.

From this low country a few tracts of low and level land extend eastward of the line above indicated. They run up for several miles, more especially between the courses of the great rivers, where they form jhils of great depth, which are uncultivable. The remainder of the eastern division has a higher level, and rises gradually towards the mountains on both sides. This country is in general dry, though there are some marshes of small extent. The surface of this division presents great irregularities. It is crossed by several ranges of alluvial formation, which run up into ridges from one to three hundred feet high, and the valleys between rise gently towards each side. The banks of the Soorma and all the mountain rivers are also considerably elevated above the general level; the tracts which lie near the swampy places, and are not much elevated above their level, are under water for some weeks, and yield only one crop. They are sown in January, and the short inundation does not damage the grain. The crops are much more abundant than in the Bhatta. The more elevated parts, which are never inundated, and especially the slopes of the ridges, yield two crops of grain, which are generally good. Some experiments which have been made show that wheat, barley, oats, and potatoes might be raised. All the grains found in the plains of the Ganges are cultivated. Indigo is not cultivated, but an excellent dye very similar to it is obtained from a plant which grows wild on the hills. Poppy, sugar-cane, safflower, sursoo and other plants yielding oil, and also hemp and flax are grown. Orange-trees and the areca are cultivated on the declivities of the Kasia Mountains, and large quantities of the produce are annually sent to Calcutta and other places in Bengal. Areca of inferior quality is found all over Silhet, but it deteriorates in quality towards the east, and in Kachar it wholly disappears. Among other fruits the plantain is particularly fine, the lemon grows wild in the Kasia Mountains, and the apricot and lichi in those of Kachar. It is thought that the tea-plant would succeed in some of the alluvial soils of Kachar or Tiperah.

The Tiperah Mountains, which lie to the south of the plain hitherto noticed, belong to Silhet only so far as a portion of their lower declivities is included within the boundary of the district. We are not acquainted with the interior of this extensive mountain-system. The central parts, between 23° and 24° N. lat. and 91° and 94° E. long., probably attain a great elevation, which may be inferred from the great volume of water brought down by the rivers which fall from the south into the Soorma and Kusiara, as the Delaseri, the Sungai, the Munu, the Khwa-hi, and the Cognati; and from their rapid course. During the rains each of these rivers discharges on an average a volume of about 25,000 cubic feet per second, though none of them are more than 50 yards wide. It is certain that they have a long course, and descend from a very elevated country. The northern portion of this mountain-region, towards Silhet, as well as that which towards the south enters the district of Chittagong, consists of ranges running south and north, divided by wide valleys. Some of these ranges enter the northern plain, as the Banca Mountains, which extend along the western banks of the Delaseri, and the Bokman range in Kachar, which compels the river Barak to change its southern course into a northern one. Immense masses of lava occur even on the northern ranges of the Tiperah Mountains, and it is supposed that this is the termination of the long series of volcanoes which stretch from the island of Java northward through Sumatra, Barren Island, the island of Narcondam, and those of Cheduba and Ramri on the coast of Arracan, where the traces of volcanic agency are lost: they appear again in the Mountains of Tiperah. The southern declivities of the Tiperah Mountains are noted for immense forests of bamboo and large herds of elephants. The northern declivities are also covered with forests of trees and bamboos, from which the inhabitants of the plain derive great profit, but they resort also to these hills to cultivate cotton, which does not grow in the plain. The quantity of cotton which is raised is barely sufficient for domestic consumption. It is short in staple, but the cloths made from it combine warmth with lightness.

Rivers.—The largest of the rivers of Silhet is called in the upper part of its course Barak, and in the lower part Soorma. The Barak originates in the mountain region north of the plain of Muneepoor [MUNEEPOOR], near 25° 30′ N. lat. and 94° 20′ E. long., and traverses in a south-west and south by west direction the mountain region which connects the Tiperah Mountains with the Bura Ail range. After a course exceeding a hundred miles, it meets with the Bokman ridge of the Tiperah Mountains, which compels the river to change its southern into a northern course. Flowing in that direction 30 miles, it turns round the northern extremity of the Bokman ridge westward, and thus enters the plain, where it begins to be navigable, a few miles above Lukipoor. It runs westward with numerous windings through the upper plain in one channel for 40 miles, but having passed the northern extremity of the Banca ridge, it begins to divide at Banga. In these parts the name of Soorma begins to prevail. The northern arm, or the Soorma, flows along the southern base of the Kasia Mountains with numerous windings, sometimes approaching the hills and sometimes receding from them, until it reaches the town of Sonamgunj after a course of 90 miles, when it turns southward, and in that direction traversing the lower plain, joins the southern arm after having run 70 miles. The southern arm of the river branching off at Banga bears different names, but in its upper course it is generally known by that of Kusiara, and in the lower by that of Barak or Brak. Its direction through the plain is west-south-west for about 100 miles, when it joins the Soorma, and the united river joins the Megna near Sunerampoor by a more southern course of about 20 miles. These appear to be the principal branches of the river, but both of them divide and subdivide again so frequently, that the whole of the lower plain is traversed by numerous watercourses, all of which join, either singly or united, the Megna between the town of Caribari and that of Sunerampoor, which are more than 100 miles from one another. Nearly all these watercourses are navigable for boats, and greatly facilitate the transport of grain from the upper plain of Silhet to other districts of Bengal. It is observed that these rivers are subject to change their beds in the districts which approach the Megna, which is the case with the Soorma itself below Azmerigunj.

Of the rivers which join the Brahmapootra or Lohit, we shall only mention the Dooyung and the Deyung. The first-mentioned river, which falls into the Brahmapootra west of 94° E. long., probably rises north east of the source of the Barak, but its source has not been ascertained. Its course is nearly due north, and about 30 miles from its mouth it is joined on the left by the river Dhunsiri, which rises in the Bura Ail Mountains, and skirts their northern declivity for more than 30 miles. The Dooyung, as well as the Dhunsiri, is navigable. The Deyung rises in the Bura Ail Mountains near 93° E. long., and after having been joined by some small rivers it becomes navigable about 20 miles below its source at Aloogong (25° 25′ N. lat.), and continues to be navigable to its mouth, with the exception of one place, where a ledge of rocks traverses the bed of the river. The Deyung is joined from the left by the Kopili, and from the east by the Soomoona river, of which the latter is navigable about 30 miles above its mouth. It is not known how far the Kopili is navigable, but this important point will soon be ascertained, as it is supposed that a good road, made between the places where the Kopili and the Jatinga, an affluent of the Barak, become navigable, will establish an easy communication between Asam and the plain of Silhet.

Climate.—The climate of the lower plain does not appear to differ in any respect from that of Bengal [BENGAL, vol. iv., p. 230]; but the upper plain has the advantage of earlier rains, which begin to fall in February, and become more abundant in the following months. Owing probably to these rains, the lower plain of Silhet is under water earlier than that of Lower Bengal.

Productions.—In the forests of the Tiperah Mountains there are herds of elephants, many of which are annually sent to Calcutta, where however they are reckoned inferior in size and quality to those brought from Chittagong. Among the minerals the chunam, or lime, perhaps is still the most important, as large quantities of it are taken from the lime-hills which skirt the Garrow and Kasia Mountains at Pondua and farther west, whence it is conveyed by water to Calcutta and other places in Bengal. Many years ago coal was discovered in the Garrow and Kasia Mountains, but it was not turned to any profit until the introduction of steam-navigation. It is now known that coal is found on the table-land of the Kasia Mountains at Chirra-Punji and Serarim, and at the base of these mountains near Silhet and Laour. But none of these coal-deposits seem to be extensive. It is however stated that those which occur in the Caribari Hills and along the southern boundaries of Asam, both which localities are within the Garrow Mountains, are not inferior in extent to any in England. Iron ore is abundant in the Kasia Mountains north of Chirra-Punji, where it is worked, and whence iron is sent to Bengal.

Inhabitants.—The inhabitants of Silhet Proper are Bengalis, and hardly distinguishable from that race in the distions farther west. But among them there are also many families of Hindustani and Persian origin, who are distinguished by their features and the stronger make of the body.

The Kacharis form the bulk of the population in Kachar, but they are also found in Asam and Tiperah. They constitute a distinct people, differing in appearance, religion, and customs from the other inhabitants. The ancient religion of Kachar is different from Brahmanism. It acknowledges a Supreme Being, or first principle, from which the world and all that it contains is derived. The manifest powers of nature are worshipped, or rather, certain spirits who have authority over them and influence the changes of the seasons. But in modern times Brahmanism has gained ground and is spreading. The Kacharis have a distinct language, but as it is unwritten, it has been superseded for all purposes of business by the Bengali for many centuries, so that at present the language is not known by many of the Kacharis themselves. The Kacharis are industrious agriculturists.

The Kasias, commonly called Cossyas, call themselves Khyees, and inhabit the mountains which have obtained their name from this nation. They are an athletic race of mountaineers, fond of martial appearance, and their reputation as warriors is hardly inferior, for their extensive predatory inroads are still remembered in Silhet and Asam. Their religion is limited to certain superstitious practices, and to reverencing and sacrificing to the presiding deities of villages, hills, and similar localities, without the knowledge of a universal and all-pervading intelligence. Brahmanism has made some progress among the Kasias, especially those of Jyntea, but it has not led to the entire abolition of their national superstitions, connected with which was the practice of human sacrifice. The Khyee language is unwritten, and exhibits no affinity to any of the neighbouring languages, some of which, numerous and diversified as they are, contain various indications of a common origin. No great respect is paid by the Kasias to hereditary chiefs, though their rank is readily admitted, but their influence depends more on their personal character and their power to direct the public assemblies without which nothing is determined, either in the community collectively or in the several villages. It was reserved to the British government to subdue the martial disposition of this people, and to compel them to discontinue their predatory incursions into Silhet and Asam. Polyandry is said to exist among the Kasias, but if it is still in use, it is far from being general.

The Nagas are another race of mountaineers, consisting of numerous small tribes, which extend from the southern border of the vale of Asam, east of the Kopili river, to the eastern portion of the Tiperah Mountains. On the north-east they appear to be neighbours of the Khamtis. They are generally associated with the Kukis, from whom however they differ essentially in language, customs, and appearance. Though in general tall, well made, and often powerful men, the limbs of the Nagas have not the massive configuration of those of the Kukis and other hill-men. It appears from the features of their face that they belong to the Mongolic race. The Nagas are not a migratory or wandering people, like the hill Kacharis and Kukis, who continually change their locality, and seldom keep their villages more than three years in one spot, whilst the Nagas remain fixed. All their villages are built on the tops of the mountains, and fortified with stockades and a ditch. Like the nations that inhabit the peninsula beyond the Ganges, they eat all kinds of animals, tigers, elephants, cows, dogs, cats, monkeys, and even serpents. It is certain that the different dialects which are spoken by them differ so much that several tribes living not far from one another hold no intercourse without an interpreter. Several of their tribes are much addicted to plundering. In 1839 some troops were sent by the British against the Angamee Nagas, who inhabit the mountainous country north of the Bora Ail range, and had become very troublesome to the Kacharis who inhabit Upper Kachar.

The Kukis inhabit the Tiperah Mountains. A few families of this race, which are found in Upper Kachar, have been transplanted to that country in modern times. Though small of stature, they seem to be the most powerful of all the mountaineers in that part of the world, and have long been notorious for their attacks on the peaceful inhabitants of the plain, not for the purpose of plundering them, but in order to kill them and carry off their heads. These heads are used in certain ceremonies which are performed at the funerals of their chiefs. In this particular, and also in their features, which approach those of the Chinese and other nations of the Mongol race, they resemble the Garrows, who also, like the Kukis, eat all kinds of animals. But both nations, as well as the Nagas, and the Mugs in Arracan, cannot be induced to take milk or anything made of it. This similarity in customs and also in their physical character, leads to the conclusion that all these nations belong to the same race of which the Chinese constitute a branch. It is however remarkable that the Garrows are separated from these nations by the Kasias and Kacharis, who differ in the conformation of their bodies, and among whom all the customs just enumerated are unknown. It is nearly certain that the Kukis are cannibals.

Political Divisions and Towns.—That portion of Silhet which forms a part of the British possessions contains the district of Silhet, and the two countries of Jyntea and Kachar, which have lately been annexed to it.

1. Silhet comprehends the whole of the lower and a part of the upper plain as far east as the Banca Mountains or the Dolaseri river. It seems to contain many small towns, and some of considerable extent. The largest is probably Baniachang, situated in the low plain between the Soorma and Bruk rivers. It is the residence of the raja of Baniachung, the greatest land proprietor in Silhet, and is a large place, containing a great population. The town of Azmeriganj, west of Baniachung, on the banks of the Soorma, is a place of considerable inland traffic, with a boat-building establishment for the construction of native craft. The town of Silhet is built on the upper plain, on the banks of the Soorma, and is the seat of the local government. Laour, farther west, at the foot of the Garrows Mountains, carries on a considerable commerce with the Garrows, who bring cotton, wax, and honey, which they exchange for salt and some cotton-cloth and brass ornaments. Lime is sent from this place to Calcutta. Pundua, a small fortress, at the base of the Kasia Mountains north-north-west of Calcutta, is the market for the Kasias, who inhabit the western part of the mountain region. They exchange wax, honey, oranges, areca nuts, canes, and other products of their country, for cotton stuffs, salt, rice, and other provisions.

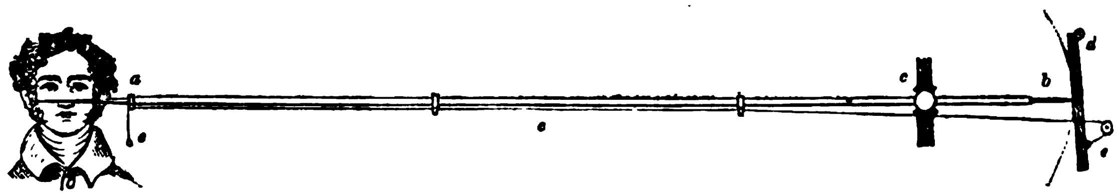
2. Jyntea lies north of the upper plain of Silhet, of which a small portion also belongs to it, and it extends northward to the boundary of Asam, where also a part of the low and flat country was subject to its raja, but the greater portion of this country was in the Kasia Mountains, and the Kasias constituted the principal population of the raja's territory. Eastward it extended to the Kopili, or the boundary of Kachar; and on the west it was separated from the mountains inhabited by the Garrows by two smaller countries, called Kairam and Dulla, whose sovereigns however seem to have been dependent in some degree on the raja of Jyntea, as they now are on the British. Jynteapoor, the capital, is built not far from the southern declivity of the Kasia Mountains in the plain, about 20 miles to the north of the town of Silhet. The convalescent station of Chirra Punji is in the territories of the raja of Kairam, and that of Nungklao is in those of the raja of Dulla.

3. Kachar, or Kirumbha, extends over the larger part of the upper plain, and the whole of the mountain region which is east of the Kopili and west of the Dooyong. But within these boundaries are the territories of the Tooleram raja, and the country inhabited by the Angamee Naga tribe, which is quite independent, whilst the Tooleram raja is dependent on the British. The country is chiefly inhabited by Kacharis, among whom many Naga tribes are dispersed, and also a number of Kukis, Bengalis, and fugitives from Munneepoor. Kachpoor, the capital, is on the plain between the banks of the Barak river and the base of the Bora Ail range: it is a poor place. East of it, and south of the pass of Hallong, is the village of Oodarbund, which is much resorted to by the Naga tribes, who exchange cotton, ivory, wax, and chillies, for salt, dried fish, conch shells, beads, and brass ornaments. But the chief part of the cotton collected in these parts is brought in boats to Raha Chucky in Asam.

History.—Silhet Proper seems always to have been subject to the sovereign of Bengal, and it passed with that province under the dominion of the British: but it does not appear that any portion of the mountain region, or even Lower Kachar, has ever belonged to any sovereign of Hin dustan. Some centuries ago however the greater part of these countries was included in the empire of Kamroop, which also extended over the greater part of Asam. This empire fell to pieces, and then the kingdoms of Muneepoor, Kachar, and Jyntea were formed. Continual disputes in the reigning families rendered them weak, but the difficulties of entering their country with an army secured them against foreign invasion. The English, after taking possession of Bengal, did not pay attention to these countries, considering this frontier sufficiently defended by the weakness of their neighbours. In 1774 they punished the Kasias of Jyntea for their predatory incursions by taking possession of that country, but restored it to the raja on payment of a fine. The Burmese, taking advantage of disputes in the royal family of Muneepoor, possessed themselves of that country, and at last (1820) declared it to be a part of their empire, and they soon after sent an army from Birma, and another from Asam, to the conquest of Kachar. Upon this the sovereign of that country and the raja of Jyntea placed themselves under the protection of the British. During the war with the Burmese, the possession of these countries was obstinately disputed, but by the peace of Yandaboo (1825) they were given up to the British, who restored them to their legitimate sovereigns. In 1830 the raja of Kachar, Govind Chandra, died, without leaving any issue, and the East India Company took possession of Kachar. A few years afterwards the raja of Jyntea was deprived of his country on account of his crimes and his cruelty, and since that time both countries have been united to Silhet.

(Walter's *Journey across the Pundoa Hills*, in *Asiatic Researches*, vol. xvii.; Pemberton's *Report on the Eastern Frontier of British India*; MacClelland, *On the Difference of Level in Indian Coal-fields*, in *Journal of the Asiatic Society of Bengal*, 1838; Grange's *Narrative of an Expedition into the Naga Territory of Assam*, in *Journal of Asiat. Society of Bengal*, 1839; Fisher's *Memoir of Sylhet, Kachar, and the adjacent Districts*, in *Journal of the Asiatic Soc. of Bengal*, 1840; Wilson's *History of the Burmese War*.)

SILHOUETTE, a name frequently applied to the black profile portraits commonly known simply as *profiles* or *shades*. The latter name indicates the origin of this simple class of pictorial representations, they having been probably suggested by the shadow thrown upon a wall. Beckmann, in his paper on 'Plant Impressions' (*Hist. of Inventions*, English edit. of 1814, vol. iv., p. 621), observes, in reference to such productions and profile portraits, 'If it be true that the extreme boundaries of all things approach or touch each other, one might almost believe that the arts of drawing and engraving on copper must have attained nearly to the highest degree of perfection.' 'At present,' he continues, 'while we have among us a Tischbein, a Haid, and other great artists, whose portraits of the persons whom they honour with their pencil or graver are such striking likenesses that they appear to live, we return again to the commencement of the art of drawing, the paltry outline of a shadow, like the love-sick daughter of Dibutades, and think we ornament our apartments and books with these dark and dismal profiles, and that we can discover by them the talents and disposition of the persons they are supposed to represent.' The name *silhouette* has been said to be derived from Etienne de Silhouette, French minister of finance in 1759. It appears that several parsimonious fashions introduced during his administration, in order, by severe economy, to remedy the evils of a war that had just terminated, were called, after this minister, *à la Silhouette*; and that the name has continued to be applied to one of them,—the use of profiles in shade.



Silhouettes are executed in various ways. One of the simplest is that of tracing the outlines of a shadow thrown on a sheet of paper, and then reducing them to the required size, either by the eye or by means of a pantograph. [PANTOGRAPH, vol. xvii., p. 192.] Another mode is tracing the outline upon a glass supported in a suitable position, and either coated with a solution of gum-arabic in water, in order to enable a lead pencil to mark upon it, or covered with a sheet of very thin tracing-paper. The camera-obscura and camera-lucida are also occasionally used for the purpose. A more certain mode of obtaining an accurate outline is by the use of the machine invented for the purpose by Mr. Schmalcalder, and patented by him in 1806. The principle of this machine is very simple, and may be readily understood by the aid of the annexed diagram. *a b* is an inflexible rod, usually about nine or ten feet long, supported by a ball-and-socket joint at *c*, in such a manner as to leave the ends free to move in any direction. At the end *a*, a *tracer*, which is tapered off to a fine point, is attached to the rod, so as to form a continuation of it: while at the opposite end, *b*, a steel point is similarly fixed. The person whose profile is required is seated, in the position indicated in the cut, in a chair having a rest for the back of the head, in order that he may sit perfectly still, while the operator gently passes the side of the tracer, *a*, over his features. By the intervention of the universal joint at *c*, a perfectly similar motion is communicated to the steel point at *b*, although, owing to the pivot being placed nearer to it than to the other end of the rod, it moves in a path smaller than that of the tracer *a*. The pivot *c* being stationary, the steel point at *b* moves in the arc of a circle of which it (the pivot) is the centre, as indicated by the dotted line in the diagram; and therefore, in order to keep the paper always in contact with it, it is fixed on a swinging board, pivoted at *d*, and constantly pressed against the steel point by means of a weight or spring, with a sufficient degree of force to make it act efficiently. The steel point does not come into immediate contact with the white paper, but with a piece of blacked paper placed over it, the pressure of the point transferring a sufficient quantity of the colour to form a distinct line. This part of the operation resembles that of a manifold-writer; and, as in that instrument, several copies may be produced simultaneously, by using a number of pieces of white and blacked paper, laid alternately upon the swinging board. The size of the reduced outline drawn on the paper may be regulated by varying the relative proportions of *a c* and *c b*; this and several other adjustments being effected by apparatus which it is unnecessary here to detail. By means of a cord *e e e*, held in the hand of the operator, the swinging board *d* may be drawn back from the steel point when it is required to move the rod without making a mark upon the paper. As it is desirable to have the tracer *a* of small diameter, it is usually formed of steel, and carefully tempered, to avoid the risk of breakage. Greater accuracy may be attained by substituting for the tracer a thin wire, tightly stretched in a bow, and adjusted so as to coincide perfectly with the axis of the rod. Some friction may be avoided by using a double-swivel joint, instead of the ball-and-socket, at *c*; but whatever kind of pivot be adopted, great care should be taken to have it perfectly accurate, as any defect in it will produce a distorted drawing. When the outline of a profile is obtained by any of the means just described, it requires to be carefully filled in with colour by hand. In some cases, in the use of Schmalcalder's machine, a kind of knife is substituted for the steel point at *b*, and the profile is thus cut out of a piece of thin black paper placed on the swinging board. This machine may also be used for making reduced copies of drawings or prints, by attaching a suitable tracing-point at *a*, and fixing the original drawing on a second swinging board in contact with it, the operator guiding the tracing-point over all the outlines that he wishes to copy. Some profilists display considerable talent in cutting silhouettes by hand, with a pair of scissors, out of pieces of black paper, without the assistance of an outline.

Although silhouettes have no claim to the character of works of art, they frequently convey a very good idea of the person represented; and they may be made even elegant in appearance. Some of the best profilists greatly improve the appearance of their silhouettes by adding the principal markings of the hair and drapery, which, if judiciously done, has a very good effect. Of the great extent to which this kind of portrait has been patronised, some idea may be formed from the fact that Mr. Schmalcalder has made and sold nearly a hundred of his machines.

SILI'CIUM, or SI'LICON, the base of the well-known earth Silica or Flint. By some chemists it is regarded as a metal, and hence the termination of its name in *um*; while others consider it as non-metallic, but more allied to boron, and these adopt the term *Silicon*.

Sir H. Davy, by acting upon Silica with potassium, arrived at the conclusion that it was an oxide, containing a peculiar inflammable base, to which he gave the name of Silicium; the accuracy of this determination has since been demonstrated by Berzelius.

In Davy's experiments the silica yielded its oxygen directly to the potassium. The process of Berzelius was different: he procured it more advantageously by passing fluosilicic acid into a solution of potash, evaporating the solution to dryness, and heating the residue nearly to redness: this being then heated with about an equal weight of potassium in a green glass tube, the potassium combines with the oxygen of the silica; the resulting mass is of a brown colour, and is to be washed at first with cold water, and afterwards with hot; then heated to redness; and, lastly, digested in dilute hydrofluoric acid, to separate any adhering silica: the silicon then remains nearly pure.

The properties of silicon are, that it has a dark-brown colour, no lustre, and is a non-conductor of electricity: it is this latter circumstance which has induced many chemists to question or deny the propriety of classing it with the metals. It is insoluble in water, and incombustible in air or in oxygen gas; it neither fuses nor undergoes any other change when heated in the flame of the blow-pipe. Neither the nitric, hydrochloric, sulphuric, nor hydrofluoric acid oxidizes or dissolves it; but a mixture of nitric and hydrofluoric acid dissolves it readily, even cold. When ignited with chlorate of potash, silicon is not acted upon; but if deflagrated with nitrate of potash, the silicon combines with the oxygen of the decomposed acid, and is converted into silica, or silicic acid; and this uniting with the potash of the decomposed nitrate, silicate of potash is formed.

Oxygen and Silicon form only one compound, namely, silica, or silicic acid. It may be obtained artificially, but very inconveniently, in the mode just mentioned, of deflagrating silicon with nitrate of potash. Silica exists very largely in nature; it is indeed probably the most abundant of all substances whatever. Many of the forms under which it occurs are described elsewhere. [QUARTZ.] Rock crystal is silica, nearly or quite pure, and flints or white sand are but slightly intermixed with other bodies. It is artificially obtained in a pure form by fusing crystal, sand, or flints, with about four times their weight of carbonate of soda or carbonate of potash; the resulting fused mass is either silicate of soda or silicate of potash; the latter is a deliquescent substance, and when it has become fluid by exposure to the air, has been long known by the name of liquor of flints; when either of these silicates is treated with hydrochloric acid diluted with water, it combines with the alkali, and with any impurity which the sand or flint might contain, such as lime, alumina, or oxide of iron, and precipitates the silica as a hydrate in the state of a colourless gelatinous mass. It possesses the following properties:—

When recently precipitated, and while it retains the state of moist hydrate, it is to a certain extent soluble in water, and still more so in acids, and also in solution of potash or soda. When it has been dried, it is an opaque white powder, colourless, insipid, and gritty, and then with more difficulty soluble in the alkaline solutions, and scarcely at all so in any other acid than the hydrofluoric. It is infusible by the heat of ordinary furnaces, but by the oxy-hydrogen blow-pipe it is more readily fused than lime or magnesia. Its specific gravity is about 2·7.

It consists of

1 Equivalent of Oxygen	.	.	8
1 Equivalent of Silicon	.	.	8
Equivalent	.	.	16

Although this substance is tasteless, and does not change vegetable blue colours red, and is insoluble in water, except under the peculiar circumstances mentioned, it is nevertheless by many chemists considered as and classed with acids, under the name of *Silicic acid*; and the various compounds which it makes with alkalis and earths, to form glass, are considered as salts. Thus with potash it forms silicate of potash; with soda, silicate of soda; and with oxide of lead, silicate of lead; and these are all constituents of glass. Clays and porcelain, on the other hand, may be regarded as silicates of alumina and magnesia, and mortar is probably a silicate of lime.

It must be evident from what has been stated, that silica is a substance of the utmost importance in many respects; it enters largely into the constitution of minerals, rocks, and fossils, and is employed in the manufacture of glass, porcelain, pottery, bricks, tiles, and mortar.

The compounds which silicon forms with other elements are comparatively unimportant: we shall mention only a few of them, and those but briefly.

Chlorine and Silicon may be made to combine by heating the silicon in chlorine gas, or by passing the gas over silicon heated to redness in a porcelain tube; or, according to Oersted, by passing chlorine gas over a red-hot mixture of finely powdered silica and charcoal.

Chloride of Silicon is composed of

1 Equivalent of Chlorine	.	.	36
1 Equivalent of Silicon	.	.	8
Equivalent	.	.	44

It is a volatile liquid which emits acid fumes; when exposed to moist air, or mixed with water, both are decomposed, and the results are hydrochloric acid and silica.

Fluorine and Silicon. [FLUOSILICIC ACID.]

Metals with Silicon.—Some of the metals may be combined with silicon; these compounds, which are not important, are termed *Siliciurets*. Some varieties of cast-iron contain nearly 4 per cent. of the siliciuret of that metal.

SILI'CULA (in Botany), a kind of fruit. In its structure it resembles the Silique [SILIQUA], and differs in nothing but its figure, which is rounded and much shorter, and in the number of its seeds. It is never more than four times as long as broad, and often much shorter. Examples of it may be seen in the whitlow-grass (*Draba*), in the shepherd's-purse (*Capsella*), and in the horse-radish.

SI'LIQUA (in Botany), a kind of fruit. It is characterised by having one or two cells, with many seeds, dehiscing by two valves, which separate from a central portion called the replum. It is linear in form, and is always superior to the calyx and corolla. The seeds are attached to two placentæ, which adhere to the replum, and are *opposite* to the lobes of the stigma. This position of the seeds, being abnormal, can only be explained in two ways: either this fruit is in reality composed of four carpels, two of which have, during the growth of the pistil, become abortive; or the stigmas must be looked upon as the fusion of two halves, one from each side. The dissepiment of the fruit in this case is most probably a spurious one formed by the projecting placentæ. It is sometimes found incomplete, from the edges of the placentæ not meeting; it is then said to be *fenestrate*. This kind of seed-vessel is possessed by a large number of plants belonging to the order Cruciferæ, and examples may be seen in the stock or wall-flower (*Cheiranthus*), in the ladies' smock (*Cardamine*), and in the cabbage, turnip, and mustard. The Linnæan class *Tetradynamia* is divided into two orders, according to the form of its fruit; those plants of the class having a silique are comprised under the order Siliquosa; those having a silicle [SILICULA], under the order Siliculosa.

SI'LIQUA (Megerle), a genus belonging to the *Leguminaria*, Schum., and consisting of those species of *Solen*, Auct., which are furnished with an internal rib—*Solen radiatus* for example. [PYLORIDIANS.]

SILIQUA'RIA. [VERMETUS.]

SILI'STRIA, a sandjak (district) of Bulgaria, in European Turkey, situated between 42° 12' and 45° 22' N. lat., and 26° 11' and 29° 3' E. long., is one of the most fertile parts of Turkey. This sandjak is bounded on the north by the Danube and Sireth, which separate it from Moldavia and Bessarabia; on the east by the Black Sea; on the south by the sandjaks of Kirk-kilissia and Tchirmen; and it has on the west Rustchuk and Lower Wallachia. It is crossed in the south by the Balkan, which forms Cape Emineh, at the termination of the mountain-range; and by a ramification of less height in a northern direction, which terminates on the Black Sea in Cape Calagriah. From these heights descend the numerous rivers which fertilise the province; the Pravadi, the Buyuk-Campt-

Chik, the Nadir, and the Aidos flow into the Black Sea, into which the Danube empties itself on the northern extremity of the province, after receiving the Dristra, the Taban, and the Karasu. It is chiefly an agricultural country.

SILISTRIA, or *Drystra*, the antient name of which is Dorostero or Durosterum, in 44° 7′ N. lat. and 27° 12′ E. long., 155 miles north-north-east of Constantinople, is the capital of the sandjak which bears the same name. The town is large, and defended by a citadel, which is kept in good order, and surrounded by double walls and ditches. The city itself is surrounded by ditches from twelve to fifteen feet deep, and defended by strong palisades. The fort is situated on the extreme west of the town, which, upon the whole, is ill built; the streets are narrow and crooked, the houses low and dull; even the five mosques and the two public baths partake of the general ugliness. There is however at the eastern extremity of the town a custom-house in a better style of architecture. The large magazines which surround it contain chiefly corn and flour. As it is a fortress built on the northern frontier, in the neighbourhood of the Danube, and is principally of a military character, the commerce has never been flourishing; and although many merchants have lately settled in Silistria, it is not likely that any greater commercial activity will be the consequence. The population amounts to 20,000, the greater part of whom are Greeks.

The environs of the town are rather pleasant, and the numerous vineyards which border the Danube give them a cheering aspect. There are also ruins, which are said to have formed part of the wall raised by the Greek emperors against the incursions of the barbarians.

Silistria has frequently been the theatre of sharp actions between the Russians and the Turks. It was unsuccessfully besieged by the Russians in 1773, and was again attacked by them in 1779, on which latter occasion they suffered a considerable loss. In 1828 General Rosh was obliged to retreat after besieging the town for some months; but it fell into the hands of the Russians in 1829, when Generals Diebitch and Krassowski took it by assault on the 30th of June.

SI′LIUS ITA′LICUS, CAIUS. The place of this poet's birth is unknown. It has sometimes been stated that the name is derived from Italica (near Seville) in Spain, and that this was the birth-place of himself or of his ancestors. But to this conjecture we must oppose the silence of Martial, who frequently mentions Silius without speaking of his Spanish origin. The name also ought in that case, according to analogy, to be Italicensis. Silius was of an illustrious plebeian family. He studied oratory, in which Cicero was his pattern; and he also aspired to make himself a poet on the model of Virgil. He is said to have possessed himself of a country-house that had belonged to Cicero, and of one that had belonged to Virgil. (Martial, *Epig.*, xi. 48.) In the year A.D. 68, in the last year of the reign of Nero, he was consul with M. Valerius Trachalus Turpilianus; and some time after he was governor of the province of Asia, which he is said to have administered in a creditable manner. He was a friend of Vitellius, and appears to be the Silius Italicus who is mentioned by Tacitus (*Hist.*, iii. 65). There was, says Pliny (*Ep.*, iii. 7), a rumour that he had acted the part of an accuser or informer under the reign of Nero; but while he enjoyed the friendship of Vitellius, he conducted himself with prudence. He finally retired to his estate in Campania, where he devoted himself to poetry and philosophy. Silius was fond of objects of art, and he enriched his residence with statues, paintings, and books. When his old age became troubled with infirmities, he hastened his death by starvation, in which he followed the fashion of those times, when suicide was not uncommon. Silius was a Stoic. The time of his death is fixed at A.D. 100, when he is said to have completed his seventy-fifth year. He was married, and had two children. He enjoyed, says Pliny, unmingled happiness to the day of his death, with the exception of the loss of his younger child.

The only extant work of Silius Italicus is an epic poem on the second Punic war, in seventeen books, entitled 'Punica.' This poem, which may be called an historical epic, comprises the chief events of the war from the commencement of the siege of Saguntum (i. 268), to the defeat of Hannibal in Africa and the triumph of Scipio Africanus. [Scipio.] The materials of Silius seem to be chiefly taken from Polybius and Livy, and the poem has consequently a kind of historical value. As a work of art, it has been variously estimated, but the judgment of the younger Pliny (*Ep.*, iii. 7) seems to us to be correct: 'Silius wrote with more industry than genius.' His poem is in fact a very laboured composition, and the labour is apparent. Numerous episodes interrupt the continuity of the narrative. Silius falls short of his model, Virgil, in simplicity and clearness; and he endeavours to make up for force and precision by rhetorical ornament and long-drawn description. Instead of making a picture by a few striking touches, he fills it with detail till the whole is trivial. His invention is poor. There are few passages which excite our sympathies. In short, the poem is a rhetorical history in verse. All his contemporaries however did not judge so unfavourably of him. Martial on several occasions speaks very highly of him, and compares him with Virgil (*Ep.*, iv. 14; vi. 64; vii. 63; 'perpetui nunquam moritura volumina Sili;' viii. 66; ix. 86; xi. 49, 51): he also celebrates his eminence as an orator. According to Martial, in an epigram written after Silius had enjoyed the consulate, he did not attempt to imitate Virgil till he had acquired distinction as an advocate. Martial mentions the court of the Centumviri as one of the places in which he practised: Pliny the younger also practised in this court. [Pliny.]

The poems of Silius seem to have been forgotten after his death, if we may judge from the silence of subsequent writers as to them. Sidonius Apollinaris is the only writer who mentions them. Poggio is said to have discovered a MS. of Silius in the library of the convent of St. Gallen, in Switzerland, which was printed at Rome, 1471, folio. Another MS. was afterwards found at Cologne by Ludwig Carrio, from which the text of Silius was improved. It was to supply the loss of the 'Punica' that Petrarca, as it is said, wrote his 'Africa.' It has been conjectured that Petrarca had a copy of Silius, which he made use of, and carefully suppressed. Such conduct would be quite inconsistent with the character of Petrarca, and one would suppose that a comparison of the two poems would soon determine whether there is any foundation for such a statement.

There are numerous editions of Silius. The editio princeps is that of Rome already mentioned. There is an edition by Drakenborch, Utrecht, 1717, and Mitau, 1775; by Ernesti, Leipzig, 1791-2; and by Ruperti, with a preface by Heyne, Göttingen, 1795-98.

There is an English translation by Thomas Ross, London, 1661, 1672, folio; and a French translation by Le Febvre de Villebrune, Paris, 1781, 3 vols. 12mo.

SILIVRI, a seaport of Romania, in European Turkey, in 41° 4′ N. lat. and 28° 13′ E. long., thirty-two miles west of Constantinople, is built in the form of an amphitheatre, on the declivity of a small hill facing the Sea of Marmara. It forms a beautiful object when seen from the sea, and commands a fine prospect of the Sea of Marmara. The top of the hill is crowned by the ruins of a fort, which was built under the Greek empire. The population is 1500 Greeks and 200 Jews. The part of the town below the fort is solely occupied by Turks, who are about 4500. The Turks have several mosques, and a market-place, which is much admired. The harbour admits only small vessels, and is generally filled with fishing-boats, which furnish the inhabitants with a plentiful supply of food. The environs of the town are covered with vineyards and corn-fields. The antient name is Selybria, often written Selymbria. (Steph. Byzant., Σηλυμβρία; Strabo, p. 319, Casaub., Σηλυβρία.) It was a colony of the Megarians.

SILK. The manner in which raw silk is produced has already been described [Bombycidæ], and its value when wrought and manufactured has also been noticed. [Riband.] China was undoubtedly the country in which men first availed themselves of the labours of the silk-worm. Serica (the country of the Seres) was a name by which the Macedonian Greeks designated the country which produced the silk that came overland from the north of China. The author of the 'Periplus of the Erythræan Sea' speaks of silk in Malabar as an article imported from countries farther to the east; from which it may be inferred that the culture of the silk-worm and the manufacture of silk had not been introduced even into India four hundred years after silk was known in Europe. In speaking of the country of the Thinæ, the same author observes that both the raw material and manufactured article were obtained there. The 'Median robes,' spoken of by the Greek writers of the period of the Persian empire, and extolled for their lustrous beauty and brilliancy, were no doubt silken vestments, as Procopius, long afterwards, when silk had been introduced into Europe, states that 'the robes which were formerly called

Median by the Greeks are now called silken.' Aristotle is the first Greek author who mentions the silk-worm (*Nat. Hist.*, v. 19); and he states that silk was first spun in the island of Cos, but the raw material was still an oriental product; and Pliny (xi. 22), in commenting on this passage, states that the silk came from Assyria, and was worked up by the Greek women: it may be remarked that Assyria was, like Media, frequently used in an indefinite sense by antient writers. The probability is that silk was used in Western Asia before it was known to the Greeks; and that it was in use among the Greeks long before they knew whence the substance came or how it was produced. Thus Virgil (*Georg.*, ii. 121) supposes that the Seres carded the silk from leaves; and Dionysius Periegetes also supposed it to be a vegetable product: thus he says,—

> 'Nor flocks nor herds the distant Seres tend;
> But from the flow'rs that in the desert bloom
> Tinctur'd with every varying hue, they cull
> The glossy down, and card it for the loom.'

Pausanias gives more precise information respecting the substance from which the Seres formed their cloths. 'They have,' he says, 'a spinning insect, which is kept in buildings, and produces a fine-spun thread, which is wrapped about its feet' (vi. 26). It was not until the sixth century that the obscurity which enveloped this subject was cleared up. At this time silk was an article of general use among the Romans, and was manufactured for them by the inhabitants of Tyre and Berytus in Phœnicia. The Persians monopolised the supply of the raw material, and guarded their trade with so much jealousy, both by land and sea, that travellers from or to China were not allowed to traverse the Persian dominions; and in the time of Justinian, in consequence of some interference with the trade, they had entirely stopped the importation of silk. The trade in silk was in this unsatisfactory state, when two Nestorian monks of Persia, who had travelled to China, acquainted Justinian with the mode of producing silk, and undertook to return and bring back with them some of the eggs of the silk-worm. They were perfectly successful in their expedition, and a quantity of eggs, secured in a hollow cane, were brought in safety to Constantinople, hatched by the heat of a dunghill, and fed with mulberry-leaves. The monks also taught the subjects of Justinian the art of manufacturing silk.

The breeding of silk-worms in Europe was for six centuries confined to the Greeks of the Lower Empire. In the twelfth century the art was transferred to Sicily; in the thirteenth century the rearing of silk-worms and the manufacture of silk were introduced into Italy, from whence it was successively intrcduced into Spain and France, and in the fifteenth century the manufacture was established in England.

James I. was extremely solicitous to promote the breeding and rearing of silk-worms in England; and in 1608 issued circular letters, which were addressed to persons of influence throughout the country, recommending the subject to them, and arrangements were made for the distribution of the mulberry in the different counties. Most of the old mulberry-trees found in the neighbourhood of antient mansions at the present day were planted at the above period. The experiment was not successful, in consequence of our climate being unsuited to the silk-worm. James also encouraged the introduction of the silk-worm into the English settlements in America. About a century afterwards (1718) a company was incorporated, which obtained a lease for one hundred and twenty-two years of Chelsea park, where mulberry-trees were extensively planted, and large buildings erected for managing the business of breeding silk-worms. This scheme also failed. An attempt was next made to introduce the silk-worm in the settlements of Georgia and Carolina; the importation of raw silk from these colonies was permitted free of duty, and its production was further encouraged by direct bounties; but the quality of the silk proved indifferent, and after the trade had languished for some time, the hope of deriving any large supply from this quarter was abandoned. About the year 1789 nurseries of mulberry-trees were planted in several states of the American Union; but though the climate is not unfavourable to the rearing of silk-worms, which are found in their natural state in the forests, the high rate of wages is an obstacle to this sort of employment, which is better adapted to the social condition of China, Italy, the South of France, and Malta, where the wages of labour have nearly reached their minimum. The subject however has again recently attracted attention in the American Union; and in 1831 a small quantity of raw silk was exported. The production of raw silk is fast extending in British India, and the quality has been for some years gradually improving. There is every prospect of the English market being in time almost exclusively supplied with silk from our Indian possessions; as labour is not only cheaper than in any part of Europe, but three 'crops' of silk may be taken in the year, while from countries west of India, including Turkey, only one can be obtained. In Graham's 'India,' it is said that in the Deccan the mulberry-trees may be deprived of their leaves six times a year, and that six crops of worms may be obtained with ease in the same period. The Chinese method of rearing silk-worms, and their mode of treating the mulberry-tree (described in Davis's *China*, p. 280), were introduced at St. Helena, under the auspices of the East India Company, but on the expiration of their charter the establishment was given up. Some of the silk produced in France is believed to be better than that of any country in the world. The average price is twenty francs per lb., and the quantity produced exceeds three million lbs. The Italian silk is also highly esteemed; the quantity produced is estimated at from six to seven million lbs. In Russia Peter the Great formed mulberry plantations, and the rearing of silk-worms was strongly encouraged by the Empress Catharine, and at present those who engage in this business obtain many important privileges. In Bavaria and other parts of Germany, with the exception of Saxony, the silk-worm is successfully reared as a commercial object; also in Sweden, where the silk is said to possess some valuable properties not found in that produced in a warmer latitude. The last attempt to introduce the silk-worm in the United Kingdom on a large scale was made in 1835, by a company which commenced its operations by planting 80 acres in the county of Cork with 4000 mulberry-trees; but the design has been abandoned as far as relates to the United Kingdom, and the company has transferred its operations to Malta.

There are several works devoted to details of the management of silk-worms, one of the best of which is that of Count Dandolo, an Italian nobleman: it has been translated into French. There are also works on the same subject in our own language.

It is said that sixteen yards of gros-de-Naples of ordinary quality, or fourteen yards of a superior description, are manufactured out of 1 lb. of reeled silk, to produce which twelve lbs. of cocoons are required. The average weight of a cocoon is from three grains to three grains and a quarter; its average length when reeled off, about three hundred yards. Taking the silk consumed in the United Kingdom in a single year at 5,000,000 lbs. the following are the statistics of production:—

Raw silk	5,000,000	lbs.
12 lbs. of cocoons to 1 lb. of raw silk .	60,000,000	lbs.
30,000 worms to 1 lb. of cocoons,	18,000,000,000	worms.
1 oz. of eggs to 100 lbs. of cocoons .	600,000	oz. of eggs.
16 lbs. of leaves to 1 lb. of cocoons	96,000,000	lbs. of leaves.
100 lbs. of leaves from each tree .	9,600,000	trees.

Silk is obtained from the spider, not the cobweb, but the silky thread which the female spins round her eggs has been woven; the silken fibres of the pinna form a strong and beautiful fabric [Mytilidæ]; and some species of moths form cocoons which may be spun as a matter of experiment and curiosity, but not with a view to commercial profit.

The quantities of raw, waste, and thrown silk taken for consumption in the United Kingdom in the following periods was as under:—

		Annual average. lbs.
1765 to 1767	(inclusive) . . .	715,000
1785 to 1787	„ . . .	881,000
1801 to 1812	„ . . .	1,110,000
1814 to 1822	„ . . .	1,940,902
1824 to 1835	„ . . .	4,164,444
1836 to 1840	„ . . .	4,999,791

The countries from which we imported raw, waste, and thrown silk, in 1839, were as follows:—

	Raw Silk. lbs.	Waste, Knubs, and Husks. lbs.	Thrown Silk. lbs.
India . . .	1,385,932	2,012	..
China . . .	349,549	10,951	..
Turkey, Syria, and Egypt .	731,121	..	..
Italy . . .	181,743	436,819	755
France . .	1,018,901	568,754	213,991
Other countries	79,002	23,954	10,522
Total . .	3,746,248	1,042,490	225,268

The duty on raw silk is 1*d.* per lb.; on waste, knubs, and husks, 1*s.* per cwt.; and on thrown silk the following duties are imposed:—5*s.* 2*d.* per lb. on organzine and crape, and 3*s* on tram and singles, dyed; 3*s.* 6*d.* on organzine and crapes, 2*s.* on tram, and 1*s.* 6*d.* on singles, not dyed. It is objected to this duty on foreign-thrown silk that it raises unnecessarily the price of all silk thrown at home. A drawback is allowed on the exportation of foreign-thrown silk: no British-thrown silk is exported. The first silk-throwing mill erected in England was at Derby, in 1718. [DERBY.]

Reeling from the cocoons is only performed in countries where the silk is produced. Silk reaches the weaver in three different states, in which it is called singles, tram, and organzine [RIBAND], the preparation of which is the business of the throwster. In plain silk-weaving the process is much the same as in weaving woollen or linen; but the weaver is assisted by a machine for the even distribution of the warp, which frequently consists of eight thousand separate threads in a breadth of twenty inches. The Jacquard loom, invented by a weaver of Lyon, has been the means of facilitating and cheapening the production of fancy or figured silks to an extraordinary extent. Patterns which required the greatest degree of skill and the most painful labour are produced by this machine by weavers of ordinary skill, and with but little more labour than that required in weaving plain silks. The Jacquard loom has been improved by Mr. Hughes and Mr. Jennings, but at Lyon it has undergone no alteration. The power-loom has been only partially employed in the silk manufacture; and excepting for the commonest goods, it does not possess any great advantage over the hand-loom, as the delicacy of the material to be worked, and the attention which must be given to the process of the weft, frequently render it necessary to stop the machine.

Brocade and damask, the most sumptuous articles of silk manufacture a century ago, are now comparatively unknown. Persian, sarsnet, gros-de-Naples, ducapes, satin, and levantines, are the names given to plain silks, which vary from one another only in texture, quality, or softness. Satin derives its lustre from the great proportion of the threads of the warp being left visible, and the piece being afterwards passed over heated cylinders. Other varieties of silk goods are produced by mechanical arrangements in the loom, such as using different shuttles with threads of various substances, &c. The pile which constitutes the peculiarity of velvet is produced by the insertion of short pieces of silk thread, which cover the surface so entirely as to conceal the interlacings of the warp and woof. The process of weaving velvet is slow, and it is paid for at five times the rate of plain silks. There are several sorts of goods in which silk is employed with woollen materials, as poplins and bombazines. The Chinese, says Mr. Davis (p. 286), make a species of washing silk, called at Canton 'ponge,' which becomes more soft as it is longer used. Their crapes have never yet been perfectly imitated; and they particularly excel in the production of damasks and flowered satins.

The silk manufacture, after its introduction into England in the fifteenth century, remained for a long period one of the least important branches of the national industry. After the revocation of the Edict of Nantes, in 1685, about 50,000 refugees fled to England, a large proportion of whom settled in Spitalfields, and carried on the silk manufacture. At this period foreign silks were freely admitted; and from 1685 to 1692, silks to the value of from 600,000*l.* to 700 000*l.* were annually imported. In 1692 the refugees obtained an exclusive patent for certain articles; and in 1697 parliament prohibited the importation of French and other silk goods; and in 1701 the silk goods of India and China were included in the prohibition. Some inconsiderable relaxation was made in this policy in 1713, but in 1765 the system of prohibition was again fully adopted, and continued in operation until 1824. During this period the state of the manufacture was anything but satisfactory; the manufacturers complaining of the smuggling of foreign silks, parliament vainly endeavouring to exclude them, with constant disputes about wages on the part of the weavers. In 1773 they obtained an act, called the Spitalfields Act, which entitled the Middlesex weavers to demand fixed wages, to be settled by the magistrates. To this act may be attributed the establishment of the silk manufacture in various parts of the country; and having done great mischief, it was repealed in 1824. The changes introduced in 1824 (some of which only came into operation July 5th, 1826), with a view of stimulating the silk manufacture, have been most successful, as the table of the consumption of silk, before and after the duties were reduced, sufficiently proves. Now that silk has become cheaper, and consequently a commoner article of dress, it is less dependent on the caprice of fashion than when it was an expensive luxury. The declared value of silk goods exported since 1820 is shown in the following table:—

	Annual average. £.
1820 to 1823 (inclusive) . . .	369,835
1824 to 1827 „ . . .	286,119
1828 to 1831 „ . . .	405,961
1832 to 1835 „ . . .	693,961
1836 to 1840 „ . . .	771,479

The declared value of silk manufactures exported in 1839 was 868,118*l.*: of which the United States of America took 410,093*l.*; British North America, 136,750*l.*; Australian settlements, 46,724*l.*; France, 44,628*l.*; British West Indies, 38,467*l.*; Chili, 44,733*l.*; Brazil, 23,117*l.*; other states of Central and Southern America, 49,060*l.*; Germany, 17,135*l.*; East Indies and Ceylon, 14,713*l.*; Holland, 14,306*l.*; Belgium, 10,316*l.*; all other parts, 18,136*l.*

The value of the silk manufactures of Great Britain is estimated at between 6,000,000*l.* and 7,000,000*l.* One-half of the silk factories are in Cheshire, next to which stand Lancashire, Somerset, Derbyshire, and Staffordshire. There are one or more factories in above one-half of the counties of England; one or two factories have been established in Ireland, and a few more in Scotland. They employ altogether in these factories above 30,000 persons, of whom two-thirds are females.

The duty on silk manufactured goods imported from European countries is equivalent to 30 per cent. ad valorem. In 1839 this duty produced 227,438*l.*, and the value of the goods was therefore about 700,000*l.*, nine-tenths of which were from France. The exportation of silk goods from France to England was 3,589,594 lbs. from 1827 to 1838; but the quantity entered at the English custom-house was only 1,875,708 lbs., and there were therefore 1,713,886 lbs. introduced by smuggling, or 48 per cent. of the total quantity entered at the French custom house for exportation to England. The duty on the legally imported goods averaged 20*s.* 4*d.* per lb.; but if the illegal imports could have been charged also, a duty of 10*s.* 11*d.* would have produced the same revenue. (Table by G. R. Porter, Esq., of the Board of Trade, in the *Report of Committee on Import Duties.*)

The silk manufactures of India are subject to an ad valorem duty of 20 per cent., which, in 1839, produced 19,867*l.* The imports consisted in that year of 503,182 pieces of bandannoes, romals, and silk handkerchiefs, of which only 112,280 paid duty for consumption in this country; and of other articles the greater part were re-exported.

(*Treatise on the Silk Manufacture*, in Lardner's 'Cyclopædia;' Ure's *Philosophy of Manufactures*; *Manual for the Culture of Silk*, prepared by order of the Massachusetts Legislature, Boston, 1832; *Essays on American Silk, with Directions for raising Silk-worms*, Philadelphia, 1830; *Second Report on Commercial Relations between Great Britain and France* (Silk), 1835.)

SILK-WORM. [BOMBYCIDÆ.]

SILLIMANITE, a crystallized *silicate of alumina.* It occurs in rhombic prisms imbedded in quartz. Cleavage parallel to the long diagonal. Colour dark brownish-grey or clove-brown. Fracture uneven, splintery. Specific gravity 3·41. Lustre vitreous, nearly adamantine on the face of cleavage. Nearly opaque. Hardness 8·0 to 8·5. Brittle and easily reduced to powder.

It is met with at Saybrook, Connecticut, North America. It was at one time considered to be a variety of anthophyllite, but it is much harder than this mineral, and contains more alumina and less silica and oxide of iron. It more nearly resembles zeolite both in form and composition.

It yielded by the analysis of Bowen—

Silica	42·67
Alumina	54·11
Oxide of Iron	2·00
Water	0·51—99·29

SILPHIUM (*σίλφιον*). Antient authors mention this plant and its juice. In the article on Laser, it has been stated that two kinds are described of this substance, which is also called juice of silphium. One kind, from Cyrene, was probably yielded by Thapsia Silphium [Thapsia], and the other was most likely assafœtida, which has been employed medicinally by Asiatics from very early times, though it has been known by this name in comparatively modern times.

Silphium was however remarkable for other properties, and hence has attracted the attention of modern travellers who have recently visited the countries where the silphium is described as growing by the antients. The army of Alexander, in crossing the mountain-range which Arrian calls Caucasus (iii. 28, 161), and which is the same range that he afterwards mentions under the name of Paropamisus (v. 3), met with the Silphium. Arrian says, on the authority of Aristobulus, 'In this part of the Caucasus nothing grows except pines and Silphium, but the country was populous, and fed many sheep and cattle, for the sheep are very fond of the silphium. If a sheep should perceive the silphium from a distance, it runs to it, and feeds on the flower, and digs up the root and eats that also. For this reason in Cyrene they drive the sheep as far as possible from the spots where the silphium grows, and some even fence in such places to prevent the sheep from entering them, if they should approach; for the silphium is worth a good deal to the Cyrenæans.' Burnes, in crossing the Hindu Koosh, and seeing both the men and cattle eating the young parts of the assafœtida plant, supposed that it must be the silphium of Arrian. But as this author describes the country where the silphium grows as abounding in cattle, Dr. Royle had concluded that the Prangos of Mr. Moorcroft was the silphium alluded to, and which is much fed on by sheep and cattle in the present day in Tibet. Mr. Vigne, when travelling in these regions, came to the same conclusion. It is probable therefore that both plants, being umbelliferous, and employed for the same purposes in nearly the same regions, may have contributed to form the accounts which are so brief in antient authors. [Laser; Prangos.]

SILURES. [Britannia.]

SILURIAN SYSTEM. One considerable group of the fossiliferous primary strata, occurring in remarkable perfection in Wales, especially in the eastern and some of the southern districts, and in some of the adjoining English counties, is thus named by Mr. Murchison in a very splendid work, the fruit of his long investigation of this part of the series of British strata. Under this title we propose to arrange some general views of the present state of our knowledge regarding the history of the lower Palæozoic strata. [Geology; Primary Strata; Palæozoic Rocks; Saliferous System.]

When Mr. Murchison commenced his researches in Shropshire and Wales (1831), the principal knowledge we possessed of the succession of the older stratified rocks of Britain, then commonly called grauwacké and transition formations, was based on the still incompletely published labours of Sedgwick in Wales and the district of the English lakes; and so little was known of their fossil contents, that it is believed the first definite notice of this kind was contained in Mr. Phillips's description of a group of slate-rocks in the vicinity of Kirby Lonsdale. (*Geol. Trans.*, 1827.) Now, in consequence principally of the development given to this subject by the appearance of the Silurian researches of Mr. Murchison, and other works to which it has led, we are able to trace in one consecutive history nearly the whole series of mineral depositions and organic combinations of which the ocean was antiently the theatre, from the period of the mica schists to the termination of the carboniferous æra.

In this survey, the Silurian strata form a very conspicuous and interesting portion, and in the district from which the type was originally drawn they appear within distinct and definite limits which seem to insulate them from the older and newer rocks, and to justify their claim to the rank of a peculiar system; but in other districts phenomena appear which show that the order of physical changes and organic combinations which characterise the Silurian System, was in operation both before and after the period included in the ages of the four Silurian groups of 'Llandeilo,' 'Caradoc,' 'Wenlock,' and 'Ludlow;' while in other districts these characteristic assemblages do not all clearly appear; and thus we are naturally conducted to a more comprehensive view of the whole of the antient (Palæozoic) formations.

Whatever be the true theory of the origin of the *Crystallized Strata* of gneiss and mica schist (with their many and various quartzose, chloritic, and calcareous accompaniments), it is at least certain, as a general rule, that rocks of this general type are prevalent among the very deepest and oldest deposits from water which retain proof of their watery aggregation, and that they are in this position devoid of the traces of antient life.

Equally certain is the character of the great series of Neptunian rocks which lies upon the mica schist; it is a vast and various mass of strata (principally argillaceous, locally arenaceous or conglomeritic, rarely yielding limestone), in which, though unequally, and in degrees varying with locality, *slaty cleavage* tends to be developed. Organic life has left traces in this series of muddy sediments both of vegetable and animal origin; in the lower and older parts very sparingly, in the upper parts abundantly. If, with Professor Sedgwick and Mr. Murchison, we take the series of these rocks as they appear in Wales and Cumberland, namely—

Silurian, or upper group;
Cambrian, or middle group;
Cumbrian, or lower group;

we shall find in the mineral characters of these groups in the countries named, some diagnostic marks of importance, but they vanish or become equivocal in other regions. In like manner the organic contents seem, in the countries named, to be definitely arranged in zones, so as to mark successive periods there: no organic remains are known in the Cumbrian rocks; they are rare, and confined to a few layers, in the Cambrian deposits; and are very plentiful and general in the Silurian group. The districts in which these peculiarities occur are probably more wide and scattered farther asunder than those in which the original types of mineral structure prevail; but yet it is evident that they are limited in respect of geographical area, and variable in regard to the distinctness and completeness of the terms, even in districts not far removed from the centre of investigation. Let any one who may desire proof of this compare the argillaceous series of Ayrshire, Westmoreland, Pembrokeshire, Tyrone, or Waterford, in which Silurian fossils occur, with the full and varied series of Shropshire, the Berwyn, and Snowdon.

Under these circumstances of difficulty in regard to the right general view of the antient fossiliferous strata, we must consider the series of Silurian rocks and fossils not as the type of this enormous sequence of mineral and organic phenomena, but as one, and perhaps the richest of all the local physical combinations of that antient period, and employ it as a general term of comparison for reducing to order and place many detached and difficult districts in which the strata have local, peculiar, and perhaps exceptional aspects.

Mr. Murchison arranges the Silurian strata in groups, as follows; in a descending order:—

	Formations.	Divisions.	Thickness in feet.
Upper Silurians	Ludlow rocks	Upper Ludlow rocks Aymestry limestone Lower Ludlow rocks	1500
	Wenlock rocks	Wenlock limestone Wenlock shale	1800
Lower Silurians	Caradoc rocks Llandeilo rocks		very variable

We shall present a very brief analysis of some of their characters.

Upper Ludlow Rocks.

Mineral Character.—Greyish, argillaceous, or calcareous sandstones, very slightly micaceous, decomposing to ashen or rusty-brown colour.

Structure.—Mostly laminated, parallel to the stratification, with joints considerably symmetrical, nearly rectangular to the plane of the beds, as near Ludlow.

Aspect of the Country.—A region rising from beneath the old red-sandstone, often to a considerable and rather continuous escarpment, as near Usk and Ludlow.

Organic Contents.—Polypiaria, 2; Crinoidea rare; Conchifera Plagimyona rather plentiful, 10; Conchifera Mesomyona, 1; Conchifera Brachiopoda, 15; Gasteropoda, 6; Cephalopoda Monothalamacea, 3; Cephalopoda Polythalamacea, 6; Crustacea, 5; Annelida?, 1; Fishes, 7; Doubtful, 3 (in all about 58 species).

Localities.—Ludlow; vicinity of Usk.

Aymestry Limestone.

Mineral Character.—Subcrystalline, argillaceous limestone, bluish-grey, or mottled, as near Aymestry.

Structure.—Irregularly laminated, or nodular; with cross joints nearly rectangulated to the plane of stratification.

Aspect of the Country.—Often a slightly prominent terrace on the woody steep escarpment of a hill, capped with Upper Ludlow rocks, as near Ludlow.

Organic Contents.—Polypiaria, 12; Crinoidea rare; Plagimyona, 6; Mesomyona, 2; Brachiopoda, 12; Gasteropoda, 9; Monothalamacea, 1; Polythalamacea, 4; Crustacea, 3 (in all about 49 species).

Localities.—Aymestry; Sedgeley near Dudley, &c.

Lower Ludlow Rocks.

Mineral Character.—Argillaceous (called 'Mudstone'), light-grey, dark-grey, or black, but weathering to ashen hues, as in the Wigmore Valley.

Structure.—Partially flaggy, in places the lamination is uneven and nodular. In the lower parts, nodules of black limestone in lines of stratification.

Aspect of the Country.—Toward the base of the steep escarpment of a hill, which may contain the whole Ludlow formation, as in the Wigmore Valley.

Organic Contents.—Polypiaria, 9; Crinoidea rare; Plagimyona, 8; Mesomyona, 2; Brachiopoda, 19; Gasteropoda, 7; Monothalamacea?; Polythalamacea, 27; Crustacea, 3; Annelida, 1; Fishes, 1; Doubtful, 2 (in all about 79 species).

Localities.—Ludlow; Usk.

Wenlock Limestone.

Mineral Character.—Grey, bluish, or pinkish crystalline and subcrystalline limestone, arranged in strata of concretionary aspect, separated by much argillaceous matter.

Structure.—As above stated, concretionary in detail, but stratified on a large scale with considerable persistence of the parts. The concretionary structure most remarkable at top and bottom.

Aspect of the Country.—Usually a prominent or terrace-like escarpment, where the beds dip moderately; rising to insulated hills, where contortions prevail, as near Ludlow, Wenlock, Malvern Hills.

Organic Contents.—Polypiaria, 53; Crinoidea, 14; Plagimyona?; Mesomyona, 1; Brachiopoda, 28; Gasteropoda, 8; Monothalamacea, 2; Polythalamacea, 9; Crustacea, 14; Annelida, 1; Doubtful, 2 (in all about 132 species).

Localities.—Dudley; Wenlock; near Usk.

Wenlock Shale.

Mineral Character.—Dull argillaceous shale, with concretions of impure argillaceous limestone, much analogous to the argillaceous Ludlow rocks.

Structure.—Laminated, with spheroidal calcareous concretions, especially toward the base.

Aspect of the Country.—Owing to the wasting of the middle beds, this shaly mass is often the line of a valley.

Organic Contents.—Polypiaria, 18; Crinoidea rare; Plagimyona, 1; Mesomyona?; Brachiopoda, 33; Gasteropoda, 4; Monothalamacea?; Polythalamacea, 5; Crustacea, 2; Annelida?; Doubtful, 2 (in all about 65 species). There are marine plants in this deposit, and we have seen them of a vermilion colour.

Locality.—Wigmore Valley.

Caradoc Sandstone.

Mineral Character.—Sandstones of various colours, more or less micaceous, sometimes quartzose or conglomeritic, with thin courses of impure limestone, especially in the upper part. (Where altered by igneous action, this sandstone becomes a sort of quartz rock.)

Structure.—Usually laminated. Where altered by heat, the stratification is nearly or quite lost.

Aspect of the Country.—Very characteristic where the strata are indurated by vicinity of trap-rocks: the quartzose masses then assuming very picturesque forms.

Organic Contents.—Polypiaria, 12; Crinoidea rare; Plagimyona, 1; Mesomyona, 3; Brachiopoda, 53; Gasteropoda, 7; Monothalamacea, 3; Polythalamacea, 6; Crustacea, 8; Doubtful, 2 (in all about 95 species).

Mineral Veins.—Green copper-ore (Malachite); thin strings of galena; and in the vicinity of trap true mineral veins occur.

Localities.—Caer Caradoc; May Hill; near Llandeilo.

Llandeilo Flags.

Mineral Character.—Hard dark-coloured flags, sometimes slightly micaceous, frequently calcareous.

Structure.—Thinly laminated, parallel to the stratification, with some internal oblique cleavage.

Aspect of the Country.—Not characteristic, the stratification being commonly very highly inclined and the masses very thick.

Organic Contents.—Polypiaria, 4; Crinoidea rare; Plagimyona, 1; Mesomyona?; Brachiopoda, 26; Gasteropoda, 3; Monothalamacea, 1; Polythalamacea, 1; Crustacea, 11 (in all about 47 species).

Mineral Veins.—Occur in the vicinity of trap, as in the Shelve and Corndon district.

Localities.—Near Built; Llandeilo; Pembrokeshire.

Pyrogenous rocks are associated with the Silurian strata in many situations—as the Caradoc Hills, where compact felspar predominates—the Wrekin and Lilleshall Hill, characterised by sienitic rocks—Corndon, full of greenstone. Alterations of stratified rocks by the contact of igneous rocks are common in the Caradoc, Stiperstones, &c. The trap rocks near Welshpool are in places columnar; the Breiddyn Hills are mostly greenstone, and yield elongated dykes in a north-east direction, which traverse the new red-sandstone. Mineral veins (yielding lead-ore) are plentiful in Lower Silurian rocks, in the Shelve district, adjacent to the trap rocks of Corndon, and the altered sandstones of the Stiperstones. 'In a plan of Mr. More's of Linley Hall, the chief proprietor of this district, upwards of 24 are laid down in the district of Shelve alone, excluding the tracts around the Bog and Penally: so that, comprehending the principal portion of the mining-ground, we may say that it contains upwards of 30 metalliferous veins which have been profitably worked.' (Murchison, *Sil. Syst.*, p. 282.)

Volcanic grits, composed of materials derived from igneous action, and subsequently arranged in water, are mentioned by M. Murchison rather frequently. In the Shelve district they are traversed by lead veins; in the Caradoc Hills, they abound, and were noticed as 'allied to greenstone' in the Wrekin by Mr. A. Aikin. They contain organic remains in several places, as near the Corndon Hills.

On reviewing the series of strata comprised in the Silurian System, in the vicinity of Ludlow, Usk, Llandeilo, or Denbighshire, we see them to form in reality one closely associated sequence of oceanic deposits—apparently accumulated with little local disturbance and very slight admixture of organic exuviæ from the land. Volcanic eruptions appear to have rather varied than greatly disturbed this system of operations, though it is evident they contributed no small part of the granular materials of the principally sedimentary strata. The formation of limestone is local:—where coral prevailed, we find the Aymestry and Wenlock limestones, and even the calcareous parts of the Landeilo rocks, to be in a great degree filled with coral. The Brachiopod shell 'Pentamerus' fills some whole beds of limestone (near Aymestry), and where it is deficient the limestone also fails, as in the district of Usk. In their course from Shropshire, northward to Denbighshire, Mr. Bowman (*Reports of the British Association for* 1840-41) has found the general type of the Silurian rocks to vary, and the line of distinction between it and the slaty strata below to be extremely obscure; and similar observations are recorded by M. Murchison in the account which he gives of these rocks in Caermarthenshire and Pembrokeshire.

Mineral character alone will scarcely suffice, anywhere, for any but an arbitrary (and therefore unsatisfactory) boundary-line between the Silurian and Cambrian deposits. It is extremely probable, perhaps we may say it is already proved, that no distinction of higher value can be found on comparing the organic remains of these groups. In Snowdon (supposed to be very low in the Cambrian series of rocks) are shells and corals, which are perhaps the same, but certainly are congeneric with and very similar to 'Silurian' fossils; and there is really as great (if not greater) difference between the Llandeilo and Wenlock rocks, in regard to fossils, than between the Silurian and Cambrian strata.

If we turn to other districts where Silurian fossils occur plentifully (North America, Ireland, Norway), the result appears the same. There is apparently only one great series of organic combinations distinguishable among the fossiliferous strata anterior to the old red-sandstone era, and it was with a perception of this important truth that Mr. Murchison once proposed for the Silurian strata the title of *Protozoic*. If instead of this we employ Palæozoic (as suggested by Sedgwick), and adopt the general view advocated in this work (PALÆOZOIC; SEDIMENTARY STRATA), we shall rank all the fossiliferous strata of the Cumbrian, Cambrian, and Silurian groups as *Lower Palæozoic Strata*.

The lower arbitrary boundary of the Silurian strata being thus softened or erased, we may regard its upper surface as only locally more definite. Certainly in all the region round Wales the separation of the Silurian and old red appears a somewhat sudden; the colour changes from grey to red; the dull mudstones become micaceous sandstones; the richly fossiliferous Upper Ludlow loses its character in unequally red marls and grits. What few fossils do occur in these overlaid strata (except near the very bottom) are of quite other types of organization. But these are local truths, depending mainly on the introduction of new sedimentary *processes to marine invertebral life*; and as these influences are very local, we may find in other countries groups of strata newer than the Silurian, older than the Carboniferous, with fossils intermediate in character and combination to both.

This expectation is in course of fulfilment, but it is not yet fully satisfied. In Devonshire, the Rhine Valley, the Eifel we find numerous assemblages of such *Middle Palæozoic* fossils, but they do not by any means fill the whole interval between the Silurian and Carboniferous types; nor have we seen in collections from North America, Australia, the Hartz, Brittany, or Russia, all that is desired to fill the void. Ever alive to this most interesting inquiry, the author of the 'Silurian System' is perhaps at this moment adding valuable facts concerning it, the fruit of his continued researches in Russia; and we believe that by further examination of the *lower strata* of the Rhine Valley, and the Hartz, some additional data may be gathered.

At present the most important of the discoveries which (however incompletely) represent a *Middle Palæozoic Period*, have been in Devonshire and Cornwall, in the Fichtelgebirge, and in the Eifel and Rhine Valley. The principal of these, at least in regard to the analogies which it offers to the strata of earlier and more recent date, is the district of Devon and Cornwall; from which ten years ago only a small number of fossil species was known, but which has now yielded to numerous inquirers fully 300 distinct and recognisable forms. Of these, according to Mr. Lonsdale, who gives (*Geol. Trans.* 1840) a table of the species which he examined, and to Mr. Murchison and Professor Sedgwick, who enumerate 196 species, a few of these species are found in the Silurian and a few in the Carboniferous rocks. Professor Phillips, in his recent work (*Palæozoic Fossils of Devon and Cornwall*), discusses the relations of 275 species, and arrives at the conclusion that both by numerical valuations of the general combinations of groups of invertebrata, and by specific analogies, the conclusion of the intermediate age of the Devon and Cornwall strata is confirmed. As the differences of the Devonian and Silurian fossils are very much greater than those between the Silurian and Cambrian fossils, it appears probable that the boundary assumed by Mr. Murchison for the upper termination of the Silurian group may remain with but slight alteration. One change contemplated by the author himself we should be glad to see adopted:—there are some fossiliferous bands placed by Mr. Murchison near the base of the old red system, which would better go to the Silurian ranks, since, in respect of the fossils which they contain and their mineral composition, they are scarcely distinguishable from Silurian strata.

In considering the distribution of organic remains in the successive stages of the Silurian rocks, it is evident that the greatest variety of species occurs in the lower part of the upper and towards the upper part of the lower Silurian rocks. In other words, the conditions favourable to organic life in the sea were in the earliest period considerable, they arrived at a maximum in the middle part of the period, in the Caradoc sandstone, the Wenlock shale and the Wenlock limestone, and still continued considerable till the Silurian deposition ceased, and were replaced by old red-sandstone nearly devoid of organic remains. Polyparia, Crinoidea, and Crustacea are most numerous in the principal calcareous rock, Wenlock limestone; Brachiopoda are most plentiful in Caradoc sandstone; Cephalopoda, in the Wenlock shale; fishes in the upper Ludlow rock.

Mr. Murchison gives the following general computation of organic remains in these strata:—

		Genera.	Species.
Pisces		13	24
Crustacea		10	47
Annelida		5	6
Mollusca	(Heteropoda[*])	1	11
	(Cephalopoda)	6	41
	(Gasteropoda)	13	34
Conchifera	(Brachiopoda)	9	107
	(Monomyaria)	1	6
	(Dimyaria)	10	21
Crinoidea		5	14
Polyparia		33	53
Doubtful		6	9
		112	375

SILU'RIDÆ, a family of fishes of the order Malacopterygii, placed by Cuvier, in his 'Règne Animal,' between the *Esocidæ*, or Pike tribe, and the *Salmonidæ*, or family of the Salmons; but in the 'Histoire Naturelle des Poissons,' the present group commences the Malacopterygii. The family *Siluridæ* constitutes a very extensive section of fishes, the species of which are for the most part confined to the fresh waters of warm climates. No group perhaps presents greater diversity of form than the Silurians, and their habits are equally interesting. Their most obvious external characters are, the want of true scales; the skin is generally naked, but in parts protected by large bony plates; the foremost ray of the dorsal and pectoral fins almost always consists of a strong bony ray, often serrated either in front or behind, or on both sides. These fishes moreover frequently are furnished with a small adipose fin on the hinder part of the back, as in the *Salmonidæ*. The mouth is almost always provided with barbules.

The genus *Silurus*, as now restricted, is distinguished by the dorsal fin being very small, without any distinct spine, and situated on the fore part of the back; the anal fin is of great length, extending along the whole belly of the fish, and sometimes joining the tail-fin; the maxillaries and intermaxillaries are furnished with small thick-set curved teeth, and there is a band of similar teeth on the vomer.

The species of this genus are confined to the old world; the only known European species is the *Silurus glanis* (Linn.), a fish of very large size, which is found in the lakes of Switzerland, in the Danube, the Elbe, and all the rivers of Hungary. In Prussia and Sweden it is also found.

The *Silurus glanis* is introduced in several works on the fishes of this country. It has however, says Mr. Yarrell, been suspected that the so called Silurus, supposed to have been found formerly in some of the Scottish rivers, might have been the burbot.

Cuvier states that this fish is sometimes upwards of six feet in length, and is said to weigh three hundred pounds (French). The body is elongated, and has the hinder part compressed, but towards the head its width gradually increases, and the head itself is depressed and large; its colour is dark-green above, of a pale-green below the lateral line, and yellowish on the belly, and the whole body is covered with dark spots; six barbules surround the mouth, and two of these, which have their origin (one on each side) just above the angle of the mouth, are very long.

Mr. Yarrell observes, 'The Silurus is represented as sluggish in its habits, and a slow swimmer, taking its prey by lying in wait for it, in a manner somewhat similar to the Angler, *Lophius*; hiding itself in holes or soft mud, and apparently depending upon the accidental approach of fishes or other animals, of which its long and numerous barbules may be at the same time the source of attraction to the victims, and the means of warning to the devourer. From its formidable size, it can have but few enemies in the fresh water; and from them, its dark colour, in addition to its habit of secreting itself either in holes or soft mud, would be a sufficient security. In spring, the male and female may be seen together, about the middle of the day, near the banks or edges of the water, but soon return to their usual retreats. The ova, when deposited, are green; and the young are excluded between the sixteenth and nineteenth days.

---

[*] These, in the preceding paragraphs, we have called Monothalamous.

'The flesh of the Silurus is white, fat, and agreeable to many persons as food, particularly the part of the fish near the tail; but on account of its being luscious, soft, and difficult to digest, it is not recommended to those who have weak stomachs. In the northern countries of Europe the flesh is preserved by drying, and the fat is used as lard.'

It appears by some statements in the 'Histoire Naturelle des Poissons,' that the present fish is so voracious, that it has been known, in several instances, to devour children; and in one instance the body of a woman was found in one of these fishes.

Several examples of the restricted genus Silurus are found in Asia.

Cuvier separates from the typical Siluri, as a genus, the *Silurus mystus* of Linnæus, and some others, on account of the compressed form of the body, and the dorsal fin having a strong bony spine in front, which is denticulated on the hinder margin. The body is deepest near the middle, but tapers somewhat suddenly towards the extremities. The head is small and depressed, and the eyes are placed low down.

The species upon which Cuvier founds this genus—to which he applies the name *Schilbe*—are found in the Nile, but there are others described in this author's great work on fishes, one of which is found at Senegal and another in India.

Genus *Cetopsis*.—This genus is founded by Agassiz on certain species found in Brazil, which in their affinities approach the genus *Silurus*, but are distinguished by the extremely small size of their eyes.[*]

Genus *Bagrus*, Cuvier.—The species of this genus are distinguished from those of the genus *Silurus*, as restricted, by their possessing an adipose fin on the hinder part of the back. The body is naked—that is, unprovided with bony plates—and the mouth is provided with barbules, the number of which, varying in different species, has been selected for the minor divisions of the group. Numerous species are found in the Indian and African rivers.

Genus *Pimelodus*, Lacép.—Differs from *Bagrus* in having no teeth on the vomer; the palatines however are often provided with teeth. The species vary much in the number of their barbules, and in the form of the head, which is often protected by a bony plate, and a large bony plate is situated between that on the head and the dorsal spine; similar bony plates on the head however are observable in many of the species of the preceding genus. The species of *Pimelodus* are very numerous, and are found both in the Old and New World. Numerous species are described from North America, others are found in South America, and the rivers of India also furnish numerous examples.

Genus *Phractocephalus*, Agassiz.—This genus contains but one species, an inhabitant of the Brazils; its generic distinction consists in its possessing some incomplete osseous rays enchased in the upper margin of the adipose fin. The head is depressed and covered by a deeply sculptured bony plate; a second bony plate, of a transverse oval form, is situated in front of the first dorsal fin. The branchiostegous rays are nine in number, and the mouth is provided with six barbules.

Genus *Platystoma*, Agassiz, is composed of several South American species of *Siluridæ* which have the muzzle depressed, and are remarkable for the great number of their branchiostegous rays, which amount in some to fifteen in number. Some of the species attain a large size, there being specimens in the Paris Museum as much as five feet in length, and they have been seen of still greater bulk.

Genus *Galeichthys*, Cuv. and Val.—This genus is nearly allied to *Bagrus*, but distinguished by the head being round and unprotected by any distinct bony plate: the branchiostegous rays are six in number. Some possess six barbules, and others have four. One species is found at the Cape of Good Hope, a second is said to be found both in North America and at Rio Janeiro; several species occur in Brazil, and the Ganges also furnishes a species of the present genus.

Genus *Silundia*, Cuv. and Val.—This genus is founded upon a fish from the Ganges, which has the head small and smooth, a very small adipose fin, and a long anal fin. It has but two barbules, and they are very small; the branchiostegous rays are twelve in number; the teeth are longer and less abundant than usual in the *Siluridæ*. The only species known (*Silundia Gangetica*, Cuv. and Val.; *Pimelodus Silundia* of Hamilton) is said to be very common at the mouth of the Ganges, and to be much esteemed for food.

Genus *Arius*, Cuv. and Val.—Contains many species of Siluridæ, allied to the *Bagri*, but distinguished by their palatine teeth forming two distinct and widely separated masses. In some species the teeth are minute and dense, like the pile on velvet, or like the teeth of a carding-machine, and in others the palate is furnished with teeth in the rounded form of paving-stones, instead of having them pointed. Species of this genus are found in the tropical portions of both continents, and also in North America.

Genus *Auchenipterus*, Cuv. and Val.—May be distinguished from other genera which possess the adipose fin by the small size of the head, the very minute size of the teeth, and there being five branchiostegous rays. It evinces an affinity with *Pimelodus* in having no palatine teeth, and in the number and form of the maxillary barbules. The first dorsal is situated very forward, a circumstance which suggested the generic name. The bony shield which covers the upper surface of the head is, in the fishes of this genus, united by a suture with the dilated bony nuchal plates. All the known species are from the tropical portions of South America.

Genus *Trachelyopterus*.—The genus is founded by MM. Cuvier and Valenciennes, upon a small Silurian from Cayenne, in which there is no adipose fin; the teeth are fine, like the pile of velvet, and the palate is destitute of teeth; the barbules are six in number. The head is somewhat short, and protected by a stout bony shield, which is united almost immediately with the dorsal on account of the shortness of the interparietal plate, and almost rudimentary state of the *chevron*, placed generally in front of the spiny rays of the dorsal fin; the pectoral fins are inserted as it were under the throat.

Genus *Hypophthalmus* (Spix), Cuv. and Val.—This genus is composed of but few species, and these are from the tropical portions of South America. The principal characters are:—Mouth destitute of teeth; eyes placed very low down near the angle of the mouth; branchiostegous rays fourteen in number; body furnished with an adipose fin.

Genus *Ageneiosus* (Lacépède), Cuv. and Val.—This genus is thus characterised in the 'Règne Animal:'—Characters the same as in *Pimelodus*, excepting that there are no barbules properly so called. In some, the maxillary bone, instead of being prolonged into a fleshy and flexible barbule, assumes the form of a projecting denticulated horn. In others this bone does not project, but is concealed under the skin; the dorsal and pectoral spines are but little apparent. All the species are from South America.

Genus *Synodontis*, Cuv.—This genus is composed of Silurians found in the Nile and Senegal, which have an adipose fin, the muzzle narrow, and terminated by an ethmoid which supports two small intermaxillary bones armed with bristle-like teeth; the lower jaw composed of two short and slender rami, bearing in front a mass of teeth which are in the form of very slender laminæ and closely packed—each of these teeth is attached to the jaw by a flexible and very slender stalk. The stout bony plate which covers the head is joined to the nuchal plate, and this extends to the first spine of the dorsal fin, which is of very large size, and in this respect resembles the first spine of the pectoral fins. The inferior barbules, and sometimes the maxillary barbules, have small lateral branches.

Genus *Doras*, Lacépède.—The species of this genus are distinguished by the lateral line being armed with bony plates, which are carinated, and terminate in a spine. They have a second adipose dorsal fin, and the foremost spine of the pectoral and anterior dorsal fins is very large and deeply serrated. Osseous plates cover the upper surface of the head and extend to the dorsal fin, and the humoral bone is produced backwards and pointed.

These may be regarded, say the authors of the 'Histoire Naturelle des Poissons,' as the most powerfully armed of all the *Siluridæ*; thus the Spanish colonists in South America have given to them the name *Mata-caïman* (or Crocodile-killer), because it often happens that when they are swallowed by these large reptiles, the œsophagus and pharynx of those animals are so lacerated by the spines of the Silurus as to cause death. Strabo also (p. 824, Casaub.

---

[*] See the part on Ichthyology of the 'Voyage of MM. Spix and Martius.'

attributes similar power to certain fishes of the Nile, which he called *choerus* (χοῖρος), and which are supposed by some naturalists to belong to the modern genus *Synodontis*.

The genus *Doras* is divided into two sections on account of the structure of the mouth. In some it is situated at the end of a depressed muzzle, and is provided with two broad bands of delicate teeth, both in the upper and lower jaws. In others the opening of the mouth is situated on the under side of a conical muzzle, and the opening is of a circular form—here the teeth are either wanting or are hardly visible; the maxillary barbules are sometimes furnished with small lateral branches. To the first of these sections belongs the *Silurus costatus* of Linnæus, a species found in the rivers of Guiana.

A species of *Doras*, described by Dr. Hancock, in the fourth volume of the *Zoological Journal*, p. 241, under the name of *D. costatus*, is a native of Demerara, where it is called the *Flat-head Hassar:* it possesses the singular property, says Dr. Hancock, of deserting the water, and travelling over land. 'In these terrestrial excursions large droves of the species are frequently met with during very dry seasons, for it is only at such periods that they are compelled to this dangerous march, which exposes them as a prey to many and such various enemies. When the water is leaving the pool in which they commonly reside, the *Yarrows* (a species of *Esox*, Linn.), as well as the second species of Hassar, to which I shall presently refer, bury themselves in the mud, while all the other fishes perish for want of their natural element, or are picked up by rapacious birds, &c. The *flat-head Hassars*, on the contrary, simultaneously quit the place, and march over land in search of water, travelling for a whole night, as is asserted by the Indians, in search of their object. I have ascertained by trial that they will live many hours out of water, even when exposed to the sun's rays. Their motion over land is described to be somewhat like that of the two-footed lizard. They project themselves forwards on their bony arms by the elastic spring of the tail exerted sideways. Their progress is nearly as fast as a man will leisurely walk. The strong scuta or bands which envelope their body must greatly facilitate their march, in the manner of the plates under the belly in serpents, which are raised and depressed by a voluntary power, in some measure performing the office of feet. It is said that the other species, the *round-head* (*Callichthys littoralis*, Hancock), has not been known to attempt such excursions, although it is capable of living a long time out of its element; but, as I before observed, it buries itself in the mud in the manner of the *Yarrows*, when the water is drying up.

'The Indians say these fishes carry water within them for a supply on their journey. There appears to be some truth in this statement; for I have observed that the bodies of the *Hassars* do not get dry, like those of other fishes, when taken out of the water; and if the moisture be absorbed, or they are wiped dry with a cloth, they have such a power of secretion that they become instantly moist again. Indeed it is scarcely possible to dry the surface while the fish is living.'

Both the species of *Hassar* here mentioned, it appears, make nests in which they lay their eggs in a flattened cluster, and cover them over most carefully. This care does not end here. They remain by the side of the nest till the spawn is hatched, with as much solicitude as a hen guards her eggs; both the male and female *Hassar*, for they are monogamous, steadily watching the spawn, and courageously attacking any assailant. Hence the negroes frequently take them by putting their hands into the water close to the nest; on agitating which, the male *Hassar* springs furiously at them, and is thus captured.

'The *round-head* forms its nest of grass; the *flat-head*, of leaves; both at certain seasons burrow in the bank; they lay their eggs only in wet weather. I have been surprised to observe the sudden appearance of numerous nests in a morning after rain occurs, the spot being indicated by a bunch of froth, which appears on the surface of the water over the nest; below this are the eggs, placed on a bunch of fallen leaves or grass, if it be the littoral species, which they cut and collect together. By what means this is effected seems rather mysterious, as the species are destitute of cutting teeth. It may possibly be by the use of their serrated arms, which form the first ray of the pectoral fins.'

Genus *Callichthys*, Linn.—The species of this genus have the body almost entirely covered by large bony plates, these forming four longitudinal ranges, two on each side the head is also protected by bony plates; the mouth is but slightly cleft, and provided with four long barbules; the second dorsal has a bony spine in front; the foremost ray of the pectoral fins is strong, but that of the anterior dorsal is comparatively feeble and short. The species of Callichthys appear to be confined to the tropical portions of South America. [CALLICHTHYS.]

Genus *Arges*, Cuv. and Val.—The principal characters of this genus are—teeth bifid at the extremity, and with the points curved inwards; palate destitute of teeth; opening of the mouth large; maxillary barbules two in number; anterior dorsal fin small, and with the front ray feeble; adipose fin long; the other fins with the outer rays prolonged into a filament.

The species which forms the type of this genus (*Arges sabalo*, Cuv. and Val.) is a small fish about eight inches in length, which was brought by Mr. Pentland from Upper Peru, being found in the neighbourhood of the mission of Santa Anna, at a height of from 4500 to 4800 French metres above the level of the sea. The specimen was given to M. Valenciennes, who prized it much, since it threw a light on the affinities of a fish described by Humboldt, under the name *Pimelodus Cyclopum*, relating to which that author has given such an interesting account. The *Pimelodus Cyclopum*, which M. Valenciennes thinks most probably belongs to the present genus, is about four inches in length, and is found in lakes at the height of 3500 metres above the level of the sea. But the most remarkable circumstance relating to these fishes is that they are frequently ejected in the eruptions from the volcanoes of the kingdom of Quito, and in such quantities that the fetid odour arising from their putrefaction was perceived at a great distance, and the putrid fevers which prevailed in those districts were attributed to the miasmata they produce. These fishes sometimes issued from the crater of the volcano, and sometimes from lateral clefts, but constantly at an elevation of from 5000 to 5200 metres above the level of the sea. In a few hours millions are seen to descend from Cotopaxi, with great masses of cold and fresh water.

The genus *Brontes*, Cuv. and Val., is founded upon a fish possessing all the characters of the preceding genus (and which, it appears, like the *Pimelodus*, is thrown out from the volcanoes of Cotopaxi), but which differs in having no adipose fin.

Genus *Astroblepus*, Cuv. and Val., consists of but one species (the *Astroblepus Grixalvii* of Humboldt). This fish possesses all the characters of the genus *Brontes*, having, like it, the head depressed, the eyes directed upwards, a single dorsal fin, the external rays of the fins prolonged into a filament, and four branchiostegous rays, but it possesses no ventral fins. This fish is found at Rio de Palace, near Papayana, where it is known by the name *pescado negro;* it attains about fifteen inches in length.

Genus *Heterobranchus*, Geoff.—Here the head is furnished with a rough bony shield, which is flat and broader than in the other Silurians, on account of the lateral laminæ furnished by the frontals and parietals, which cover the orbital and temporal bones. The operculum is still smaller than in the preceding fishes, and what chiefly distinguishes these fishes from others of the family is, that, besides the ordinary branchiæ, they have an apparatus ramifying like the branches of a tree adhering to the upper branch of the third and fourth branchial rays; the branchiostegous rays vary from eight or nine to fourteen or fifteen in number. The pectoral spine is strong and denticulated, but there is no bony spine to the dorsal fin. The body is elongated and naked, and the dorsal and anal fins are greatly extended in the longitudinal direction. The barbules are eight in number. The species inhabit the rivers of Africa, and some of those of Asia.

In some species the long dorsal fin is supported throughout by rays; these constitute the subgenus *Clarias*, Val.; and in others there is a dorsal fin supported by rays, and a second behind this, which is adipose. To them the term *Heterobranchus* is restricted in the *Histoire Naturelle des Poissons*.

Genus *Saccobranchus*, Cuv. and Val.—This genus is founded upon the *Silurus Singio* of Hamilton's 'Fishes of the Ganges,' which possesses some interesting peculiarities in its internal organization, pointed out by Mr. Wyllie, in the 'Proceedings of the Zoological Society,' for May, 1840.

Genus *Plotosus*, Lacépède, is distinguished by the elongated form of the body and the possession of two dorsal fins, the hindermost being supported by rays as well as the other. The head is protected by a bony plate, the lips are fleshy and pendent, the jaws are furnished with strong and conical teeth, and the vomer with rounded teeth. The species inhabit India.

Genus *Aspredo*, Linn.—The fishes of this genus, says Cuvier, present very singular characters, particularly in the flattening of the head and in the dilatation of the anterior portion of the trunk, which chiefly arises from that of the bones of the shoulder; in the proportionate length of the tail; in the small size of their eyes, which are placed in the upper surface of the head. The intermaxillaries are situated under the ethmoid, directed backwards, and are only furnished with teeth in their hinder margin. But the most striking character consists in there being no power of motion in the operculum, a character which distinguishes the present genus from all other osseous fishes. The branchial opening consists of a simple slit in the skin under the external edge of the head, and the branchiostegous membrane is provided with five rays; the dorsal fin is of moderate size; the anal is long; the tail moderate, and the adipose fin is wanting: the whole of the body is smooth and without bony plates. The species are found in the tropical parts of South America.

Genus *Chaca*, Cuv. and Val., which is the next in succession in the *Histoire des Poissons*, is founded upon the *Platystacus Chaca* of Buchanan Hamilton. It inhabits the rivers of India.

The genus *Sisor* is also founded upon a single species described (under the name *Sisor rhabdophorus*) by the author just mentioned, in his *Fishes of the Ganges*.

Genus *Loricaria*.—Linnæus gave this name to a group of *Siluridæ* distinguished by the head and body being covered throughout by large angular bony plates; they differ moreover from certain other Siluri which have the body protected by plates (such as *Callichthys* and *Doras*), in having the opening of the mouth on the under side of the muzzle, in this respect approaching the genus *Synodontis*. The intermaxillaries are small and suspended beneath the muzzle, and the mandibles are transverse and not united; they are furnished with long and slender teeth, and these are flexible and terminate in a hook. The mouth is encircled by a large, circular, membranous veil; the pharyngeal bones are furnished with numerous teeth rounded like paving-stones. The true opercula are fixed as in *Aspredo*, but two small external plates, which are movable, appear to take their place. The branchiostegous rays are four in number. The first ray of the dorsal, pectoral, and anal fins is in the form of a strong spine.

This genus is subdivided into two subgenera. In the one (*Hypostomus*, Lacép.), there are two dorsal fins; the hinder one is small and provided with but one ray. The labial veil is covered with papillæ, and provided with a small barbule on each side. The belly is not protected by plates. The species are found in the rivers of South America. In the second subgenus, to which Lacépède restricts the term *Loricaria*, there is but one dorsal fin; the labial veil is furnished with several barbules, and sometimes beset with villosities; the belly is protected by plates. The species of this section are also found in South America.

SILVA Y FIGUERO'A, GARCIA DE, was born of illustrious parents at Badajoz, in 1574. At the age of fifteen his father sent him to court, where he entered the household of Philip II. as page. He then joined the Spanish army in Flanders, where he greatly distinguished himself, and obtained the command of a company. Having subsequently shown some talent for diplomacy, he was despatched by Philip III. on an embassy to Shah Abbás, king of Persia, who was willing to conclude a treaty of commerce with Spain. Silva embarked for Goa, where he arrived in 1614; but the governor of that place, who was a Portuguese, fearing lest Silva's mission should lead to an inquiry into the administration of the Spanish possessions in India, threw every impediment in his way, and refused to provide him with a vessel and money to prosecute his journey, as he was ordered to do. Impatient at the delay, Silva embarked on board a native vessel and sailed for Ormuz, which port he entered on the 12th of October, 1617. Thence he sailed to Bandel (Bender Abassi) in the dominions of the Shah, when he was well received. He reached Ispahán on the 18th of April, 1618, by the then usual route of Lar and Shiráz. After a short residence in the latter place, Silva started for Kaswín, or Casbin, where Shah Abbás was then holding his court, who received him with every mark of distinction, but would not hear his message until he had himself returned to Ispahán, where he directed Silva to wait till his arrival. Accordingly, after a stay of two months at Kaswín, the Spanish envoy returned to Ispahán, where Shah Abbás arrived shortly after, in July, 1619. He granted Silva an audience; but though he manifested a wish to conclude a commercial treaty, and to be upon friendly terms with Spain, the Shah refused to subscribe to two conditions stipulated by the ambassador of Philip III., namely, that he should restore some fortresses belonging to Ormuz, which he had lately seized; and that he should exclude all other European nations from trading with his dominions. The negotiations for the treaty being thus suspended, Silva left Ispahán on the 25th of August, 1619, and returned by the same route to Goa, where he landed in November, 1620. From Goa he sailed to Spain, where he died in 1628.

During his residence in Persia Silva wrote an itinerary of his travels, with an account of such events as came within his observation; and a sketch of the manners and customs of the inhabitants of that empire. This work was never printed in the original Spanish, though a French translation appeared in 1667, under the title of 'L'Ambassade de Don Garcias de Silva Figueroa en Perse, contenant la Politique de ce Grand Empire, les Mœurs du Roi Shah Abbas, et une relation exacte de tous les Lieux de la Perse et des Indes où cet Ambassadeur a été l'espace de huit anneés qu'il y a demeuré,' par M. Wicqfort, Paris, 1667, 4to. It is one of the best accounts of Persia that we possess, and is much commended by Chardin. During his residence in Goa Silva also made an abridgment of Spanish history, which appeared at Lisbon soon after his death: 'Breviarium Historiæ Hispanicæ,' Lisbon, 1628, 4to. A Latin letter of his, dated Ispahan, 1619, and addressed to the Marquis of Bedmar, in which he gave a short account of his travels, was also published at Antwerp: 'Garciæ Silva Figueroa, Philippi III. Hispaniarum Indiarumque Regis, ad Persarum Regem Legati, de Rebus Persarum Epistola,' Antw., 1620, 8vo.

SILVER, a metal which has been well known and highly valued from the remotest period—circumstances which are readily explained by the facts of its occurring frequently native, and possessing great lustre and fitness for immediate use without being subjected to any metallurgic process.

Ores of Silver.

Native Silver.—This occurs crystallized, arborescent, or dendritic, capillary, reticulated, granular, and massive. The primary form of the crystal is a cube. It has no cleavage Fracture hackly. Colour white, but externally often blackish, owing probably to the presence of a little sulphur. Hardness 2·5 to 3. Lustre metallic. Colour pure white, except when tarnished. Streak shining. Opaque. Specific gravity 10·47. Malleable, but commonly less so than pure silver, probably owing to an admixture of other metals. Soluble in nitric acid, and the solution colourless when pure, but blue if copper be present; and if antimony, a white substance, and if gold, a black one remains undissolved. Fuses into malleable globules before the blowpipe.

Native silver is met with in most parts of the world: in the British Isles, Germany, Hungary, in the north of Europe, but especially, and in largest quantity, in Mexico and South America. Silver occurs in mixture or combination with other metals, as already hinted at. The first compound of this nature we shall describe is

Antimonial Silver. Stibiuret of Silver.—This occurs in crystals, in grains, and massive.

Primary form of the crystal a right rhombic prism. Cleavage parallel to the terminal plane and short diagonal of the prism. Fracture uneven. Colour silver white, or, when tarnished, yellowish white. Streak silver white. Lustre metallic. Opaque. Slightly malleable. Easily frangible. Hardness 3·5. Specific gravity 9·44 to 9·8.

Before the blow-pipe on charcoal readily melts, with the formation of white antimonial vapour, into a greyish globule, which is not malleable, but eventually pure silver is obtained. It is not totally soluble in nitric acid, oxide of antimony remaining undissolved.

The Massive Varieties are amorphous, and have a granular or foliated structure.

Antimonial silver is found in clay-slate at Andreasberg in the Harz; in Baden; near Guadalcanal in Spain; at Salzburg; and at Allemont in France.

The Andreasberg mineral (1), analysed by Vauquelin, and the Baden (2), by Klaproth, gave the annexed results:—

	(1)	(2)
Silver	78·0	84·75
Antimony	22·0	15·25
	100	100

Telluric Silver occurs in coarse-grained masses. Colour grey. Lustre metallic. Soft. Somewhat malleable. Specific gravity about 8·5. It is dissolved by nitric acid, and when heated, and before the blow-pipe, on charcoal, gives a fused blackish mass, containing specks of metallic silver.

It is found at the silver mines of Savodinski, in the Altai Mountains, Siberia.

Analysis by Rose—

Silver	62·42
Tellurium	36·96
Iron	·24
	99·62

Native Amalgam is a compound of silver and mercury. [Mercury.]

Auriferous Native Silver occurs crystallized in cubes, capillary, and disseminated. Colour yellowish white. Specific gravity 12·0 to 17·0. Different varieties gave the annexed results to

	Fordyce.	Klaproth.	Boussingault.			
Silver	72	36	15·5	37·6	26	35·07
Gold	28	64	84·5	62·4	74	64·93
	100	100	100·	100·	100	100·

Arsenical Antimonial Silver, or rather Arsenic-ferruginous Antimonial Silver.—This substance occurs mammillated, or in small globular and reniform masses, and sometimes investing other substances. When untarnished it is nearly silver white, but is commonly tarnished yellowish or blackish; its lustre is metallic. It is harder than antimonial silver, but is sectile and brittle. Specific gravity 9·4.

Before the blow-pipe antimony and arsenic are volatilized with the alliaceous smell, and a globule of impure silver remains. Its localities are nearly the same as those of antimonial silver. Klaproth obtained from a specimen from Andreasberg—

Silver	12·75
Antimony	4·00
Iron	44·25
Arsenic	35·
	96

The native compounds of silver next to be described are those in which it occurs in combination with the non-metallic elements. It is not found simply combined with oxygen, nor at all with azote, hydrogen, or fluorine.

Chloride of Silver. Horn Silver. Muriate of Silver. Kerargyrite.—This ore occurs crystallized and massive. Primary form of the crystal a cube. No cleavage. Fracture uneven. Hardness 1·0 to 1·5. Yields to the pressure of the nail. Streak shining. Specific gravity 4·75 to 5·55. Translucent. Opaque. Lustre resinous. Colour grey, yellowish, greenish, and blue of various shades. Malleable and sectile. Fusible in the flame of a candle. Heated with potash by the blow-pipe, yields a globule of metallic silver. Insoluble in nitric acid, but dissolved by ammonia. When rubbed with a piece of moistened zinc, the surface becomes covered with metallic silver.

This ore occurs in various parts of Europe and America, along with others of the same metal. The largest masses, which are of a greenish colour, are brought from Mexico and Peru. It is found in veins, chiefly in primitive rocks.

Two specimens from Peru (1) and from Saxony (2), analysed by Klaproth, gave—

	(1)	(2)
Chlorine	24	21·50
Silver	76	67·75
Oxide of Iron	—	6·00
Alumina	—	1·75
Sulphuric acid	—	0·25
	100	97·25

Buttermilk Silver. Earthy Corneous Silver.—This is regarded as a variety of the foregoing. It is described as being of a brownish colour, with occasionally a tinge of green or blue. It is opaque, dull, with an earthy fracture, and is soft, sectile and heavy. It occurs massive, and also investing other substances. It occurs only at Andreasberg in the Harz.

According to Klaproth, it is composed of—

Chlorine	8·28
Silver	24·64
Alumina	67·08
	100

Iodide of Silver. Iodargyrite.—Occurs massive in thin plates, which are silver or greyish white, and which become bluish by exposure to the air. Transparent. Translucent. Lustre resinous to adamantine; in thin laminæ flexible and malleable. Melts on charcoal before the blowpipe, vapour of iodine being evolved, and globules of silver remaining. Found at Albarradon near Mazapil, in the state of Zacatecas, Mexico, in serpentine.

Sulphuret of Silver. Vitreous Silver. Silver Glance. Henkelite.—Occurs crystallized and massive. Primary form a cube. Fracture fine-grained and uneven; sometimes small and flat conchoidal. Colour lead-grey; blackish when tarnished. Lustre metallic. Opaque. Hardness 2·0 to 2·5. Malleable. Sectile. Specific gravity about 7·2.

When heated by the blow-pipe, sulphur is expelled and silver remains. It occurs in Saxony, Bohemia, and in great abundance in Mexico. It has been occasionally found in Cornwall, and in most silver-mines.

Analysis, (1) by Klaproth, of a specimen from Freiberg, (2) by Berzelius:—

	(1)	(2)
Sulphur	15	12·95
Silver	85	87·05
	100	100

Black Sulphuret of Silver. Earthy Silver Glance.—Derived from the decomposition of the last mentioned. Occurs massive and pulverulent. Fracture uneven. Colour dark lead-grey, inclining to black. Devoid of lustre, or only feebly glimmering. Somewhat sectile. Streak shining, metallic. It is found in Norway, Siberia, Hungary, &c., usually investing other silver-ores or filling up cavities in them.

Sulphuret of Silver and Arsenic. Light Red Silver. Proustite.—Primary form a rhomboid. Colour cochineal to aurora red; streak lighter. Lustre adamantine. Translucent to transparent. Specific gravity 5·5 to 5·6.

It is found at Joachimsthal, Johanngeorgenstadt, Annaberg, &c.

Rose's analysis (1) and Proust's (2) give the following as the composition of a specimen from Joachimsthal:—

(1)		(2)	
Sulphur	19·51	Sulphuret of Silver	74·35
Silver	64·67	Sulphuret of Arsenic	25·
Arsenic	15·09		
Antimony	00·69		99·35
	99·96		

Sulphuret of Silver and Antimony. Ruby Silver. Dark Red Silver. [illegible].—Occurs crystallized and massive. Primary form a rhomboid. Cleavage parallel to the primary planes, usually indistinct. Fracture conchoidal. Colour, by reflected light, from lead-grey to iron-black; by transmitted light, from brilliant to dark red. Lustre adamantine. Translucent. Opaque. Hardness 2·0 to 2·5. Extremely brittle. Streak red. Specific gravity 5·8 to 5·9.

Massive Varieties.—Structure granular, compact, lamellar, dendritic, amorphous.

It is found in many parts of Europe and America, as Germany, Norway, Mexico and Peru, and also in Cornwall.

According to Bonsdorff, a specimen from Andreasberg yielded by analysis—

Sulphur	16·609
Silver	58·949
Antimony	22·846
	98·404

Sulphuret of Silver and Antimony. Miargyrite.—Occurs crystallized. Primary form an oblique rhombic prism. Cleavage imperfect. Fracture uneven. Colour iron-black in mass; but in thin fragments deep red by transmitted light. Nearly opaque. Lustre bright metallic. Hardness 2·0 to 2·5. Very sectile. Streak dark red. Surfaces of the crystals usually striated. Specific gravity 5·2 to 5·4.

It is found with argentiferous arsenical pyrites at Braunsdorf, near Freiberg, Saxony.

According to Rose, it yielded—

Sulphur	21·95
Silver	36·40
Antimony	39·14
Copper	1·06
Iron	0·62
	99·17

Sulphuret of Silver and a little Iron. Biegsamer Silberglanz.—Occurs crystalline and massive. Crystals small and tabular. Cleavage parallel to the terminal planes. Colour nearly black. Lustre metallic. Very soft. Readily separable into thin flexible laminæ.

Found only in Hungary and at Freiberg.

According to Wollaston, this mineral (which is extremely rare) consists of sulphuret of silver with a little iron.

Sulphuret of Silver and Iron. Sternbergite. Flexible Sulphuret of Silver.—Occurs crystallized. Primary form a right rhombic prism. Cleavage parallel to the terminal plane, distinct. Laminæ very flexible. Colour dark-brown, often with a blue tarnish. Streak black. Lustre metallic. Hardness 1·0 to 1·5. Specific gravity 4·2 to 4·25.

It is found at Johanngeorgenstadt, Schneeberg, and Joachimstahl in Bohemia, with other silver-ores.

A specimen from the last-mentioned locality yielded, according to the analysis of Zippe—

Sulphur	30
Silver	33·2
Iron	36·
	99·2

Brittle Sulphuret of Silver, Antimony, and Iron. Brittle Silver Glance.—Occurs crystallized. Primary form a right rhombic prism. Crystals commonly macled. Fracture usually conchoidal, with a shining metallic lustre. Colour dark grey or iron-grey. Hardness 2·0 to 3. Specific gravity 5·9 to 6·4.

It is found in Saxony, Bohemia, Hungary, Siberia, and Mexico.

Analysis of a specimen from Frieberg by

	Klaproth.	Rose.
Sulphur	12	16·42
Silver	66·5	68·54
Antimony	10·	14·68
Iron	5·	0·00
Copper	0·5	0·64
	98·5	100·28

Sulphuret of Silver and Copper. Silberkupferglanz.—Occurs massive. Compact. Fracture brilliant, granular, flat conchoidal. Colour dark lead-grey. Streak shining. Lustre metallic. Opaque. Soft. Specific gravity 6·25.

Found at Schlangenberg, near Colivan in Siberia.

Analysis by Stromeyer :—

Sulphur	15·96
Silver	52·87
Copper	30·83
Iron	00·34
	100

Sulphuret of Silver, Antimony, and Copper. Romelite. Mine d'Argent grise Antimoniale.—Occurs crystallized. Primary form a right rhombic prism. Cleavage parallel to the lateral planes. Colour nearly silver-white. Lustre shining, metallic. Opaque. Hardness 2 to 2·5. Extremely brittle. Specific gravity 5·5 to 5·6.

It consists principally of sulphur and the metals above named, but in proportions not yet determined.

Sulphuret of Silver, Arsenic, Antimony, and Copper. Polybasite. Brittle Silver.—Occurs crystallized. Primary form a right rhombic prism. Cleavage imperfect. Fracture uneven. Colour iron-black. Lustre metallic. Translucent. Opaque. Hardness 2·0 to 2·5. Specific gravity 6·269.

Occurs in Bohemia, Saxony, and other parts of Europe; and in Mexico and Peru.

Analysis (1) of a specimen from Mexico by Rose, and (2) from Freiberg by Brandes :—

	(1)	(2)
Sulphur	17·04	19·40
Silver	64·29	65·50
Arsenic	3·74	3·30
Antimony	5·09	0 00
Copper	9·93	3·75
Iron	0·06	5·46
	100·15	97·41

Sulphuret of Silver, Iron, Copper, Bismuth, and Lead. Bismuthic Silver.—Occurs in acicular crystals and massive. Fracture uneven. Colour, when first broken, lead-grey, but liable to tarnish.

Massive Varieties disseminated, amorphous. Fracture fine-grained, uneven. Lustre metallic. Opaque. Soft. Sectile and brittle.

It is found accompanying pyrites and galena at Schappach in the valley of Kinzig, Baden.

Analysis by Klaproth :—

Sulphur	16·3
Silver	15·0
Iron	4·3
Copper	0·9
Bismuth	27·
Lead	33·
	96·5

Seleniuret of Silver. Selensilver.—Occurs crystallized. Primary form a cube. Occurs in thin plates. Hardness between gypsum and calcspar. Flexible. Specific gravity 8·0. Colour iron-black; streak the same, but brighter. Occurs at Tilkerode in the Harz, associated with seleniuret of lead.

Analysis by G. Rose :—

Selenium	24·05
Silver	65·56
Seleniuret of lead, with a little iron	6·79
	96·40

Seleniuret of Silver and Copper. Eukairite.—Occurs massive. Structure granular. Colour grey. Lustre shining. Disposed in films on calcareous spar.

Found in a copper-mine at Skrickerum in Smaland, Sweden.

Analysis by Berzelius :—

Selenium	26·
Silver	38·93
Copper	23·05
Earthy matter	8·90
Carbonic acid and loss	3·12
	100

Carbonate of Silver and Antimony. Selbite.—Occurs massive and disseminated. Fracture uneven. Colour greyish-black. Structure fine granular. Lustre metallic. Opaque. Soft. Brittle. Heavy.

Found at Altwolfach in the Black Forest.

Analysis by Selb :—

Carbonic acid	12
Silver	72·6
Oxide of antimony and a trace of copper	15·5
	100·1

This analysis cannot however be correct, if the ore contain carbonate of silver.

Arseniate of Silver and Iron. Gansekothig-erz; Goose-dung Silver-ore.—Occurs massive. Mammillated. Fracture conchoidal; sometimes earthy, and mixed with cobaltore. Colour yellow or pale green. Streak white. Lustre resinous.

Found chiefly in the mines of Clausthal in the Harz; and also in Cornwall, and at Allemont in France.

It does not appear to have been accurately analysed.

Having now mentioned the principal minerals which contain silver, it is to be observed that few of them are largely worked as ores: the principal are native silver, chloride of silver, and sulphuret of silver. The first, when the quantity is considerable, is separable by mere fusion; the chloride and the sulphuret are obtained by amalgamation with mercury; the sulphuret being first converted into a chloride by treatment with common salt, &c. A considerable quantity of silver is also procured from the lead-ore of this country by cupellation.

Properties of Silver.

The properties of silver are, that it has a purer white colour than any other metal; it has great brilliancy, and is susceptible of a very high polish. Its specific gravity is about 10·4 when cast, and 10·5 to 10·6 when stamped or rolled. It is sufficiently soft to be cut with a knife. It is very malleable and ductile, so that it may be beaten into leaves about 1-10,000th of an inch in thickness, and drawn into wire much finer than a human hair. It does not rust or oxidize by exposure to the air, but when the air contains sulphureous vapours it tarnishes, becoming first yellowish and afterwards black. Three metals only, viz. iron, copper, and platinum, exceed silver in tenacity; a wire 0·787 of a line in diameter supports rather more than 187 pounds without breaking. When exposed to a bright red heat silver melts, which, according to Daniell, is equivalent to 1873° of Fahrenheit; on fusion its appearance is extremely brilliant, and during this it absorbs oxygen from the air to the amount of about 22 times its volume, and this it gives out either by cooling or by being poured into water. When leaf-silver or fine silver-wire is heated by voltaic electricity, it burns with a fine green flame: if intensely heated in the open fire, it boils, and a portion is vaporized.

Oxygen and Silver combine to form three compounds, viz. suboxide, protoxide, and peroxide.

Protoxide of Silver is prepared by oxidizing and dissolving the metal in dilute nitric acid; when lime or barytes water, or solution of potash or soda, is added to the solution of nitrate of silver, a precipitate is formed, which is the protoxide of silver, composed of

One equivalent of oxygen . .	8
One equivalent of silver . .	108
Equivalent .	116

The properties of this oxide are, that it is of a brownish colour, inodorous, tasteless, very slightly if at all soluble in water; it is decomposed by the action of light, being reduced to metallic silver and oxygen gas, and the same effect is produced by heat. It is insoluble in the alkalis or alkaline earths in general, but is rapidly and largely dissolved by ammonia. Nitric, acetic, sulphuric, and some other acids combine with it readily, but it is decomposed by hydrochloric acid, the results being chloride of silver and water. It gives a yellow colour to glass and porcelain. This is the oxide which is the basis of all the common salts of silver.

Suboxide of Silver was first procured by Faraday, by the partial decomposition of the protoxide; when the ammoniacal solution of this is exposed to the air, its surface becomes covered with a pellicle or dark film, which is the suboxide in question; it is probably owing to the decomposition of a portion of the ammonia, which in this case yields hydrogen to a part of the oxygen of the protoxide of silver.

According to Wöhler, it may be obtained also by subjecting citrate of silver to a temperature of 212°.

Suboxide of silver appears to be a di-oxide, composed of—

One equivalent of oxygen . .	8
Two equivalents of silver . .	216
Equivalent .	224

It does not readily, if at all, form salts with acids.

Peroxide of Silver has been stated to be obtained by electrizing a weak solution of silver. It separates at the positive pole in the state of minute acicular crystals.

Sulphuric and phosphoric acid decompose it with formation of respective salts of the protoxide, and by ammonia it is acted upon and decomposed with great energy.

It appears to be a binoxide, composed of

Two equivalents of oxygen .	16
One equivalent of silver . .	108
Equivalent .	124

Chlorine and Silver readily combine, and the compound, as already mentioned, forms one of ore of silver.

It may be artificially formed in several ways, first by heating the metal in a finely divided state in the gas, or by adding any soluble chloride, as common salt, to nitrate or any soluble salt of silver, except the hyposulphite.

When recently precipitated, or if kept from the action of light, chloride of silver is perfectly white, but by exposure to daylight it becomes slowly bluish-white, and eventually almost black. The direct rays of the sun produce this effect almost instantaneously; on this property is founded its use in photogenic drawing; the exact nature of the change which takes place does not appear to have been satisfactorily determined. This chloride is quite insoluble in water, either cold or hot; the stronger acids take it up sparingly, and it is precipitated from them by dilution; it is dissolved however to some extent by hyposulphurous acid, and readily and largely by ammonia. It is decomposed by hydrosulphuric acid, and soluble sulphurets, which immediately blacken it by converting it into sulphuret of silver; it is also decomposed by hydrogen gas, and by iron and zinc when put into contact with it and water. By mere heat it undergoes no change except fusion, and when it has solidified on cooling, it has the appearance of horn; hence the name of *horn-silver* for the native chloride.

It is composed of—

One equivalent of chlorine . .	36
One equivalent of silver .	108
Equivalent .	144

Chloride of silver is largely and advantageously used both in qualitative and quantitative analyses, to determine the presence and quantity of chlorine, chlorides, and hydrochlorates.

Fluorine and Silver may be combined to form fluoride of silver. It is an uncrystallizable soluble compound; when heated it fuses; and at a higher temperature and exposed to the air it is slowly reduced.

It is composed of

One equivalent of fluorine . .	18
One equivalent of silver . .	108
Equivalent .	126

Sulphur and Silver form sulphuret of silver; this compound has been already noticed as existing in nature and constituting the *vitreous silver-ore*. It may be prepared by direct action, as by heating alternate layers of silver and sulphur; thus obtained, it is a soft malleable dark-coloured compound; it may be procured also by decomposing solution of nitrate or of ammoniuret of silver by hydrosulphuric acid, hydrosulphates, or soluble sulphurets. It is insoluble in water, ammonia, or other alkalis or acids, except nitric acid, which decomposes and is decomposed by it with the formation of sulphate of silver.

It is composed of—

One equivalent of sulphur .	16
One equivalent of silver .	108
Equivalent .	124

Phosphorus and Silver.—The substances combine when heated together; and form a white brittle compound; when fused and exposed to the air, it loses phosphorus. It may be formed either by projecting phosphorus on red-hot silver, or by heating a mixture of silver filings, phosphoric acid, and charcoal.

It is composed of

One equivalent of phosphorus .	16
One equivalent of silver . .	108
Equivalent .	124

Iodine and Silver readily combine when hydriodic acid or iodide of potassium is added to a solution of nitrate of silver. The iodide of silver formed is precipitated of a greenish-yellow colour; it is insoluble in water or ammonia, and decomposed when heated with potash; when fused, it acquires a red colour, and is discoloured by light; in the invention of the Daguerreotype, a film of this compound, on the surface of a polished plate of silver, is the substance that receives the impressions of light. It is decomposed by concentrated nitric or sulphuric acid.

It is composed of

One equivalent of iodine .	126
One equivalent of silver . .	108
Equivalent .	234

The compounds containing oxide of silver consist of the ammoniuret and the oxisalts of silver: we shall first mention the

Ammoniuret of Silver.—Protoxide of silver dissolves with great readiness in ammonia, and by careful operation the substance discovered by Berthollet, and called *fulminating silver*, is obtained. It should be prepared only in very small quantity at a time, on account of the facility and violence with which it explodes; in exploding it forms water, sets free azotic gas, and metallic silver, remains; it is procured by adding a small quantity of solution of ammonia to oxide of silver; a portion is dissolved, and a black powder, which is the fulminating ammoniuret of silver remains; it may be also formed by adding solution of potash from the ammonio-nitrate of silver; a very gentle heat or slight friction causes it to explode, sometimes even before it is dry. Its exact composition has not been determined.

We come now to the compounds of the oxacids and oxide of silver, or the oxisalts of silver; it is the protoxide only which enters into combination with acids; at least they are the only well-known compounds. The first we shall mention is

Nitrate of Silver.—This is one of the most important salts of silver. It is generally prepared by adding the metal to the diluted acid, in which case the silver is oxidized by decomposing a portion of the nitric acid, and that which remains undecomposed dissolves the oxide formed. It may also be prepared, but less advantageously, by dissolving the protoxide of silver in the dilute acid; in this case no nitric oxide is evolved, for no nitric acid is decomposed. The solution is colourless, and by evaporation colourless crystals are readily obtained, the primary form of which is a right rhombic prism. Nitrate of silver has a bitter metallic taste, is soluble in about its own weight of water at 60°, and in half its weight of boiling water; the solution is neutral to litmus-paper. Cold alcohol dissolves only a little of this salt, but when boiling takes up a considerable quantity of it, the greater part of which separates on cooling.

By the action of light, especially when in contact with organic matter, nitrate of silver is rendered of a dark colour, and is then insoluble in water. When moderately heated, nitrate of silver fuses, and being then cast in a mould in small cylindrical sticks, it constitutes the argenti nitras of the Pharmacopœia, commonly called *lunar caustic;* if the heat applied be too great, the salt is decomposed, oxide of silver being left, which, if still more strongly heated, gives metallic silver. When sulphur, phosphorus, or charcoal is mixed with nitrate of silver, and struck on an anvil, detonation ensues, and metallic silver is obtained; the experiment should be made on very small quantities. Nitrate of silver is decomposed by simply placing charcoal or phosphorus in its solution, metallic silver being deposited in the crystalline state; the same effect is produced by several metals, and more especially copper, which is used in silver-refining for precipitating the silver from the nitrate in a pure state.

Chlorate of Silver may be obtained by dissolving protoxide of silver in chloric acid; the solution yields small rhombic crystals, which are soluble in four parts of water at 60°. This salt is not applied to any use.

Nitrate of silver is decomposed by sulphuric and phosphoric acids, and their soluble salts, sulphate and phosphate of silver, are thrown down. Potash and soda and the alkaline earths precipitate protoxide of silver; ammonia produces the same effect, but when added in excess, redissolves the oxide at first precipitated. Hydrosulphuric acid, hydrosulphates, and soluble sulphurets occasion the formation and precipitation of black sulphuret of silver.

Chlorine partially, and soluble chlorides and hydrochloric acid and hydrochlorates, perfectly, decompose nitrate of silver, chloride of silver being precipitated. It is on this account that nitrate of silver is employed, and with great accuracy, in both qualitative and quantitative analyses.

Nitrate of silver is composed of

One equivalent of nitric acid .	54
One equivalent of protoxide of silver	116
Equivalent .	170

Besides the uses already named, nitrate of silver is employed by precipitation with carbonate of soda, &c. for writing on linen; it is commonly called indelible ink.

Carbonate of Silver is prepared by adding a solution of carbonate of potash, or of soda, to one of nitrate of silver. It is a white substance, insoluble in water, but dissolved by ammonia, and decomposed by acids; it is blackened by exposure to light, and readily decomposed by heat. It is probably composed of

One equivalent of carbonic acid .	22
One equivalent of oxide of silver .	116
Equivalent .	138

Sulphate of Silver.—This salt may be formed by boiling finely divided silver in strong sulphuric acid, by dissolving the protoxide in dilute sulphuric acid, or by adding a solution of sulphate of soda to one of nitrate of silver, when it is thrown down as a crystalline precipitate.

Sulphate of silver is a colourless salt, soluble in about 90 parts of water at 60°; a saturated boiling solution deposits crystals on cooling, which are prismatic and anhydrous; when strongly heated, the acid is expelled, and metallic silver remains. It is sometimes employed as a chemical reagent, and is composed of

One equivalent of sulphuric acid .	40
One equivalent of oxide of silver .	116
Equivalent .	156

It is decomposed by chlorides and sulphurets, in the same manner as the nitrate of silver.

Sulphite of Silver may be obtained by adding sulphite of potash to a solution of nitrate of silver, or by digesting oxide of silver in a solution of the acid. It has the form of crystalline grains, and, unlike most other salts of silver, is stated to retain its whiteness when exposed to light. It is composed of

One equivalent of sulphurous acid .	32
One equivalent of oxide of silver .	116
Equivalent . .	148

Hyposulphate of Silver is prepared by digesting carbonate of silver in hyposulphuric acid. It crystallizes in prisms.

Hyposulphite of Silver.—It is obtained by gradually adding a weak solution of nitrate of silver to a dilute one of hyposulphite of soda. It is a precipitate of a grey colour, and the supernatant liquor is stated by Herschel, who has particularly examined this salt, to be remarkably sweet, without any metallic flavour. It is also formed when chloride of silver is dissolved in a hyposulphite. This salt is very liable to spontaneous decomposition, and becomes black owing to the formation of sulphuret of silver. The hyposulphites have been advantageously employed in removing of the unchanged salt of silver in photogenic drawings. Hyposulphite of silver is composed of

One equivalent of hyposulphurous acid	48
One equivalent of oxide of silver .	116
Equivalent . .	164

Phosphate of Silver.—This is prepared by adding a solution of the common neutral phosphate of soda to one of nitrate of silver; a yellow precipitate is formed, which is quickly discoloured by exposure to light; becomes brown when heated, but regains its yellow tint on cooling; and when strongly heated, it melts. It is soluble in nitric and phosphoric acid. It is a subsesquiphosphate, composed of

1 equivalent of phosphoric acid .	36
1½ equivalent of oxide of silver .	174
Equivalent . .	210

Pyrophosphate of Silver is obtained by heating neutral phosphate of soda so as to expel its water, and adding a solution of it to one of nitrate of silver. This precipitate is of a white colour. Like the preceding, it is composed of one equivalent each of acid and base.

We shall mention the properties of a few of the salts formed by the combination of the vegetable acids with oxide of silver.

Acetate of Silver.—It may be prepared by dissolving oxide of silver in acetic acid, or, as it is a salt of slight solubility, in water, by decomposing nitrate of silver with acetate of soda, when it is thrown down as a crystalline flocculent precipitate. It is a colourless salt, sparingly soluble in water, and decomposed at a red heat. It is occasionally used as a chemical re-agent. It consists of

One equivalent of acetic acid .	51
One equivalent of oxide of silver .	116
Equivalent . .	167

Benzoate of Silver may be obtained either by digesting moist oxide of silver in a solution of benzoic acid, or by adding a benzoate to it. It is a white anhydrous compound.

Citrate of Silver is formed by adding a citrate to nitrate of silver. It is an insoluble white powder, which blackens by exposure to light, and detonates slightly when heated. It is composed of

One equivalent of citric acid .	56
One equivalent of oxide of silver .	116
Equivalent . .	172

Oxalate of Silver is precipitated when oxalic acid or an oxalate is added to nitrate of silver. It is insoluble in water, white, and rendered black by exposure to light. It detonates slightly when struck on an anvil. It is soluble in nitric acid, and decomposed by hydrochloric acid. It is probably composed of

One equivalent of oxalic acid . .	36
One equivalent of oxide of silver .	116
Equivalent . .	152

Cyanide of Silver is prepared by adding hydrocyanic acid to a solution of nitrate of silver; the hydrogen of the acid uniting with the oxygen of the oxide of silver, water is formed, and the cyanogen and silver combine, and form cyanide of silver, which is precipitated. It is colourless, insoluble in water or solution of potash or soda, but readily taken up by ammonia. Nitric and sulphuric acid act but slightly upon it, unless concentrated and heated; hydrochloric acid decomposes it, and hydrocyanic acid and chloride of silver result, and this is one of the methods of procuring the last-mentioned acid, adopted in the London Pharmacopœia. It is decomposed by hydrosulphuric acid, by which sulphuret of silver and hydrocyanic acid are obtained. It is composed of

One equivalent of cyanogen . .	26
One equivalent of silver . . .	108
Equivalent . .	134

Ferrocyanide of Silver is obtained when ferrocyanide of potassium is added to nitrate of silver. It is a white insoluble substance.

Cyanate of Silver is formed when cyanate of potash is added to nitrate of silver. It is a white powder, slightly soluble in hot water, and also in ammonia. It blackens when heated, and burns with deflagration, and there are produced di cyanide of silver, cyanic acid, carbonic acid, and azotic gas.

Fulminate of Silver. Fulminating Silver.—This very explosive compound is formed by dissolving 60 grains of silver in half an ounce of nitric acid of specific gravity 1·38; to the solution are to be added two ounces of alcohol of specific gravity 0·88, and the mixture is to be heated in a capacious flask; a white flocculent precipitate soon begins to appear, and when ebullition commences, the flask is to be removed from the heat; the effervescence still continues, and when it has ceased, the product is to be collected on a filter, washed with cold water, and dried at a temperature not exceeding 100° Fahrenheit.

Fulminate of silver is a greyish-white crystalline powder. It becomes darker by exposure to light; it dissolves in about 40 parts of boiling water, and separates, as the solution cools, in minute crystals. In the quantity even of a half grain it detonates violently, either by the action of heat, electricity, strong sulphuric acid, or friction. When placed on one flint, and slightly touched with another, explosion also takes place. It has been known to detonate with great violence when a little has remained between a stopper and the neck of a bottle, on screwing in the stopper. It should be preserved therefore in small portions, in paper, in a wide-mouthed corked vial. It is composed of

One equivalent of fulminic acid .	68
Two equivalents of oxide of silver .	232
Equivalent - .	300

Alloys of Silver.—Little or nothing is known respecting the alloys of silver with the following metals:—Potassium, sodium, and the metals of the alkaline earths; manganese, cadmium, nickel, uranium, tellurium, titanium, cerium, chromium, and vanadium.

Iron and silver combine with difficulty. They separate on cooling, the iron retaining about one-eightieth of silver, and the silver about one-thirtieth of iron. According to Faraday and Stodart, steel containing about one five-hundredth of silver forms a good alloy for cutting instruments. Iron and silver form a bluish-white granular alloy; tin and silver, a white, hard, brittle alloy. When cobalt and silver are fused together, they separate during cooling, each retaining a portion of the other. Lead and silver give a dull brittle alloy; antimony and silver, a white brittle alloy; arsenic and silver form a grey, brittle, granular compound, containing about 14 per cent. of the former metal. Bismuth and silver give a yellowish-white, brittle, lamellar alloy; molybdenum forms a compact, brittle, grey, granular compound with silver; and tungsten, a brown, slightly malleable button; copper and silver readily combine, and the silver is rendered harder by it without much deterioration of colour; the standard silver of this country is composed of 11·10 silver and 0·90 copper. Mercury and silver amalgamate readily, and this compound is sometimes employed for plating, but this operation is now being most advantageously carried on by precipitation by means of voltaic electricity.

Properties of the Salts of Silver.—The solutions of the salts of silver are recognised by the following, among other properties which have been occasionally mentioned:—

They give a white precipitate, insoluble in water or in dilute acids, but readily in ammonia, by chlorides and hydrochlorates; the precipitate becomes black by exposure to the light.

Metallic silver is precipitated by copper and the solution of protosulphate of iron; black sulphuret, by hydrosulphuric acid and hydrosulphates. A yellow precipitate by arsenious acid and phosphate of soda; a red-brown, by arseniates; a crimson, by chromates; and white, by the ferrocyanide of potassium.

With respect to the uses of silver it is scarcely requisite to say anything, as they are well known in its application to coin and the formation of vessels of great beauty and durability.

SILVER, PRODUCTION AND CONSUMPTION.

Silver-ores are found chiefly in veins which traverse the primary and the older of the secondary stratified rocks, but especially the former; and also the unstratified rocks, such as granite and porphyry, which are associated with the above. Some of the richest mines in South America are situated in primary strata; also in limestone and in grauwacke, and in still more secondary strata. In some of the mines of Peru, and in those of Kongsberg in Norway and Freiburg in Saxony, silver has been discovered in masses weighing from 100 to 800 lbs. In the mines of Europe the veins are numerous and slender; in some of the mines in the Harz Mountains and in the Hungarian mines the veins occur in a small number of spots, and are of considerable dimensions. In three of the richest districts of Mexico there is only one principal vein, which is worked in different places. One of these veins, in the district of Guanaxuato, is from 130 to 148 feet wide, and it has been traced and worked to an extent of nearly eight miles.

In Mexico there were 500 mining establishments, called *Reales*, at the time of Humboldt's visit, and from 3000 to 4000 veins or masses were worked. The most common ores are the sulphuret of silver, antimonial silver, and muriate of silver.

The average richness of all the ores in Mexico is from 3 to 4 ounces per quintal of 102 lbs. In one of the Mexican mines a working of one hundred feet in length yielded in six months 432,274 lbs. troy of silver, equal in value to about 1,000,000*l.* In Chili some of the mines yield only 8 oz. in 5000 lbs. of ore; but in the rich mine of Copiapo, discovered in 1832, the ore frequently contains 60 or 70 per cent. of silver. The average produce of the mines in Saxony is from three to four ounces in the quintal. The lead-mines of Craven in Yorkshire contained 230 ounces per ton; and those of Cardiganshire, worked in the reign of Charles I., yielded 80 ounces. The average proportion of the lead-mines of the north of England is 12 ounces per ton. Even when the proportion of silver is so low as eight ounces, or one grain per ½ lb., it has been found profitable to separate it.

The pure metal is separated from the ore by various processes; by mechanical division, roastings to separate the sulphur and other volatile matter, and melting at different stages of purification, with the addition of fluxes of various sorts. Refining is performed by amalgamation with quicksilver, the two metals being afterwards separated by distilling off the quicksilver.

The produce of the Mexican mines averaged annually 4,800,000*l.* from 1793 to 1803, of which nineteen-twentieths were silver. In the first ten years of the present century the average annual value was about 5,000,000*l.*, the quantity of pure silver annually produced in that time being 1,440,650 troy lbs. The mines of Potosi in Peru are the most famous in South America. [POTOSI.] The produce of the Chilian mines in 1832 was about 1,000,000 ounces. At the commencement of the present century Humboldt estimated the annual produce of the silver-mines of Chili, Peru, Buenos Ayres, and New Grenada, at nearly 700,000 lbs. troy, valued at 2,074,476*l.* sterling.

The annual average of both gold and silver coined in the different mints of Spanish America was estimated, in 1810, at 8 millions sterling, namely, in Mexico 24 millions of dollars; Lima, 6 millions; Potosi, 4½ millions; Santa Fé and Santiago, each 1½ million; and Popayan and Guatemala, nearly 1 million. The proportion of silver to gold coined at all these mints was stated as 30 to 1; but the proportion of silver to gold produced from all the American mines was as 62 to 1; and from the mines of all countries as 52 to 1. In a work published at Paris in 1807 by M. Brongniart, the value of the gold and silver brought annually into circulation from all parts of the world was estimated at nearly 46 millions of dollars; of which 36 were from the mines of Spanish America, 4½ from those of Portuguese America, and 5½ from the mines of the Old World. (*Report of Bullion Committee*, 1810.)

The most productive mines in Europe are those in Saxony, Austria, Hungary, Norway, Russia, and Spain. The mines in Saxony have been worked since the tenth century. The average annual produce of all the European mines in the last twenty years of the eighteenth century did not exceed 600,000*l.* in value. In the early part of the thirteenth century the mines of Schneeberg in Saxony are said to have yielded 600,000*l.* annually; but taking the average of all the mines of late years, the annual produce does not, according to the estimate of Mr. Jacob, exceed 400,000 lbs., or 100,000*l.* in value. The mines of Chemnitz and Kremnitz in Hungary have been worked about a thousand years. Those of the Tyrol have long ceased to be productive. The mine of Kongsberg in Norway was probably the richest in Europe during the middle of the last century. It yielded 649,270 lbs. troy, value nearly 2,000,000*l.*, in the forty years from 1728 to 1768. The silver of Russia is obtained from the refining of stream gold found in the Ural Mountains, and from lead-ores. Silver-mines were worked in Spain from a very early period by the Phœnicians, Carthaginians, Romans, and Moors; but they are now abandoned as unprofitable.

Native silver and several of the other varieties of the ores are met with in some of the Cornish copper-mines, and silver is extracted from the ore of English lead; but with these exceptions, and very small quantities which are occasionally found of this metal, silver cannot be considered as constituting one of the mineral treasures of the United Kingdom. A vein of silver-ore and the sulphuret was worked in Stirlingshire during the latter part of the last century, and from 40,000*l.* to 50,000*l.* were obtained, when the vein was lost. In 1607 a silver-mine was worked in Linlithgowshire.

The silver-mines of Asia have ceased to be very productive in modern times. There are mines in Armenia, but none are known to exist in Persia, nor in any part of the East India Company's possessions. Silver-mines are worked in China; and Mr. Davis remarks (*Chinese*) that the great quantities of silver brought to Lintin for many years past, to be exchanged for opium and exported to India, prove that there must be abundant sources in the empire. Silver is not obtained in any part of Africa.

Gold and silver appear to have been in request from the earliest ages. Abraham was rich in silver and in gold. He bought a field for a burial-place, for which he paid 400 shekels of silver, delivered 'by weight, according to the currency of the merchants.' (*Genesis*, xxii., 14-16.) Joseph, his great-grandson, was sold by his brethren for twenty pieces of silver (*Genesis*, xxxviii., 29); and when aftewards they went to Egypt to purchase corn, they brought 'silver in their sacks' mouth.' (*Genesis*, xlv., 22.) In the book of Job (xlii., 11-12), we read of silver passing from hand to hand as money. The writer of that book was acquainted with the fact that silver was found in veins and gold in particles, though the country in which he lived did not produce the precious metals. It is said (1 *Kings*, x.) that in the days of Solomon silver was nothing accounted of, and that 'the king made silver to be as stones in Jerusalem.' Darius Hystaspes, king of Persia, annually collected 9880 talents of silver, besides gold, as tribute from Asia and Africa; subsequently tribute came in also from the islands of the Mediterranean and from Europe as far west as Thessaly. Herodotus states (iii. 96) that the gold and silver were melted and poured into earthen vessels, and that the earthen vessels were then removed, which left the metal in a solid mass: when any was wanted, a piece was broken off as the occasion required. Silver was coined at Rome 266 B.C., before gold had been so employed. [COIN.]

For further information on the production and uses of the precious metals, the reader may refer to Mr. Jacob's elaborate 'History of the Consumption of the Precious Metals,' 2 vols. (1831). Chapter ii. contains an account of the mines of the antients, and their modes of mining and smelting. Chapter x. is an inquiry into the production of the precious metals during the middle ages, from the dissolution of the Western Empire to the discovery of America. Another chapter is on the produce of the mines at the epoch of this discovery; also one from this period to the opening of the mines of Potosi, in 1564; and two other chapters, one on the produce of gold and silver from 1700 to 1809, and the other extending the inquiry from 1809 to 1829, complete this part of the subject. The investigations of Humboldt, and the personal inquiries of Mr. H. G. Ward (*Mexico in* 1827), with the scattered notices of other writers, are collected and arranged by Mr. Jacob, whose work must always be valuable for reference in all questions relating to the history of prices. Several chapters of the work are devoted to this topic in connection with the increased supply of the precious metals after the discovery of America, and the rise of prices which occurred in Europe in the sixteenth century. The gold and silver coin in Europe, in 1492, Mr. Jacob estimates at 34,000,000*l.*, which was increased in the course of the next 112 years by 138,000,000*l.*, making the total gold and silver currency in 1599, allowing for abrasion, &c., 172,000,000*l.* In book i., chapter xi., of the 'Wealth of Nations,' there is a 'Digression concerning the Variations in the Value of Silver during the course of the Four last Centuries.'

The proportional value of gold to silver was 12 and 10 to 1 from the Anglo-Saxon times to the discovery of America: it is at present 14·28 to 1. In antient Greece the proportion varied from 15 and 10 to 1, and in Rome from 12 and 7 to 1. Herodotus (iii. 95) estimates it at 13 to 1. Since the discovery of America the proportion throughout the world has been 17 and 14 to 1. (Kelly's *Cambist.*)

Mr. Jacob gives the amount of silver coined in each reign from the time of James I.:—

		£
James I. . .	(22 years)	1,807,277
Charles I. and the Commonwealth .	(35 years)	9,776,544
Charles II. . .	(22 years)	3,722,180
James II. . .	(4 years)	2,115,115*
William and Mary, and William III.	(12 years)	7,093,074
Anne . . .	(13 years)	618,212
George I. . .	(13 years)	233,045
George II. . .	(33 years)	304,360
George III. from		
1760 to 1809 .	(49 years)	63,419
1809 to 1820 .	(11 years)	6,933,346

The last new silver coinage for the United Kingdom was commenced in 1816, since which time the quantity of silver coined in each year has been as follows:—

Years.	Amount Coined.	Years.	Amount Coined.
1816	£ 1,805,251	1829	108,259
1817	2,436,297	1830	151
1818	576,279	1831	33,696
1819	1,672,272	1832	145
1820	847,717	1833	145
1821	433,686	1834	432,775
1822	31,430	1835	146,665
1823	285,271	1836	497,719
1824	282,070	1837	75,385
1825	417,535	1838	174,042
1826	608,605	1839	390,654
1827	33,019	1840	207,900
1828	16,288		
		Total	£ 11,108,265

The weight of silver coined, and the number and denomination of each coin issued from 1816 to 1840 inclusive, were as follows, according to a parliamentary paper (*Sess.* 1841):—

	Weight. lbs.	Number.	Value. £
Crowns .	140,144	1,849,905	462,476
Half-crowns .	1,190,876	31,438,434	3,929,804
Shillings .	1,540,080	101,645,280	5,082,264
Sixpences .	441,852	58,324,595	1,458,114
Fourpences .	52,140	10,325,320	177,062
Maunday money:—			
Fourpences .	306	60,720	1,012
Threepences .	270	71,368	892
Twopences .	225	89,100	742
Pence .	272	215,424	897

The seignorage, or the difference between the price at which bullion is purchased and the mint price of the coin at 5*s.* 6*d.* an ounce, amounted to 616,747*l.* on the above. The Maunday money is coined for the purpose of being distributed by the Lord Almoner in Whitehall Chapel on Maunday Thursday.

When silver is issued for coin, it is always alloyed with copper: the maximum of hardness is produced by one-fifth of copper. One lb. of standard silver of the English coinage contains 11 oz. 2 dwts. of pure silver and 18 dwts. alloy, or 925 parts of pure silver in 1000 parts of standard silver. [MONEY.] For purposes connected with the manufacture of various articles of use and ornament the alloy is greater. At Birmingham rolled sheets are made which do not contain more than 3 or 4 dwts. of silver to each lb. of the inferior metal.

---

* Including £1,596,799 base money coined for Ireland.

The rolling of silver in contact with the inferior metals is performed by powerful flatting-mills. A bar ot copper is made quite smooth and clear on one of its surfaces, and is then sprinkled over with glass of borax, and there is laid upon it a plate of fine silver, and the two are carefully bound together by wire. The mass is then exposed to a full red heat, which melts the borax and causes the silver to adhere to the copper. The ingot is now passed through a rolling-press and formed into a plate, both the silver and copper extending uniformly during the whole process, at the conclusion of which they are inseparably joined.. The art of silver-plating was introduced at Sheffield about the middle of the last century. Another mode of plating is called 'silvering,' when an amalgam of silver and mercury is well rubbed upon the surface of the copper; by the application of heat the mercury is driven off, and the silver remains behind, adhering firmly to the copper, and capable of being highly polished.

Mr. Jacob estimates the annual consumption of silver in the United Kingdom at 3,282,046 oz., valued at 820,521*l.* The consumption for watch-cases is about 506,000 oz. annually: 100,000, each weighing on an average 2½ oz., are stamped annually at the London Assay-office; 60,000, each weighing 2 oz., are stamped at Birmingham; and 80,000, of the same weight, are stamped at the other assay-offices in the kingdom. About 900,000 oz. are used by coach-makers, harness-makers, and saddlers' ironmongers. In articles of small size, such as thimbles, of which hundreds of thousands are annually made; chains for watch-guards, pencil-cases, necks of smelling-bottles, locks of pocket-books, instrument cases, and portfolios, and small portions to handles of penknives and razors, the silver used is under the weight which subjects it to the stamp-duty of 1*s.* 6*d.* an oz., but a very considerable quantity of silver is employed in these minor objects. Leaf-silver for gilding is made two and a half times thinner than gold, and the gold-beaters require a considerable quantity of the metal for this purpose. Some articles are 'washed' with silver. Mr. Jacob distributes the total consumption as follows:—

That paying duty . . .	1,275,316 oz.
That used in watch-cases . .	506,740
That used in plating . .	900,000
That for other minor purposes .	500,000
	3,282,046

The value of the stock of silver in the hands of the manufacturers and dealers is estimated by the same authority at 3,280,000*l.* The value of ornaments and utensils of the precious metals in Europe and America, if brought to the crucible, Mr. Jacob values at 400,000,000*l.*, or one-fourth more than the value of the coined metals. The annual consumption of gold and silver in Europe and America for ornamental purposes he states to be nearly 6,000,000*l.*, that of Great Britain being valued at 2,457,000*l.* In M'Culloch's 'Dictionary of Commerce,' it is stated that Mr. Jacob's calculations are generally too high. Silver forms by far the largest proportion of the value of domestic utensils in which either of the two precious metals are used. In England the gold currency is of much higher relative value than that of silver [CURRENCY]; but in most other countries this is not the case. The coinage of silver and gold in France is estimated at 100,000,000*l.*, a very large proportion of which is of silver. Since the peace, the number of silversmiths and persons engaged in working silver and gold into articles of ornament and use has greatly increased on the Continent; and the increase of the same class is probably also considerable in the United Kingdom. See the articles ANDES, CHILE, MEXICO, PERU, POTOSI, for an account of the South American mines; AUSTRIA, HUNGARY, SAXONY, &c., for those of Europe.

(Jacob's *Inquiry into the Production and Consumption of the Precious Metals*, 2 vols., London, 1831; Humboldt's *New Spain; Personal Researches*, &c.; Ward's *Mexico*, &c.)

SILVER, *Medical Properties of.* In a purely metallic state silver has no action on the animal frame, and the only salt much used is the nitrate, termed also *lunar caustic.* This is always fused in proper moulds, from which it is turned out in the form of cylinders, about three inches long, and the eighth of an inch in diameter. They are at first white, but quickly become of a dark grey or black colour, from combining with organic matter in the air. To prevent this the cylinders are generally wrapped up in blue paper. When nitrate of silver is brought in contact with any part of the human frame, it causes first a white mark, which gradually changes to blue, purple, and at last to black. This occurs more rapidly if moisture be present; and is owing to a chemical combination of the metal with the albumen and fibrin of the animal tissues. If the part be wetted, and the caustic applied several times at short intervals, vesication results. Nitrate of silver acts therefore locally as an *irritant* and *corrosive*. When taken internally in small doses for a considerable time, such as six or twelve months, it is absorbed and deposited in various parts of the body, and when it is deposited in the *rete mucosum* of the skin it causes discolorations, which in most cases prove permanent. It has been employed frequently with success, but often with failure, in the treatment of epilepsy, chorea, and some forms of *angina pectoris*, as well as morbid sensibility of the stomach. Larger doses can be borne when it is administered in the form of pill than in solution. The pills should be made with mucilage and sugar, but not with bread-crumb, as the common salt, or chloride of sodium, decomposes the nitrate and renders it inert. In cases of poisoning by nitrate of silver, common salt is a ready and effectual remedy. The liability of nitrate of silver to produce discolorations of the skin in persons taking it internally constitutes a serious objection to its employment, and there appears little necessity for giving it, since any case of epilepsy likely to be benefited by it will generally receive equal good from the use of *oxide of zinc*, without the risk of stains or other inconvenience. It has been suggested that the use of nitric acid internally as well as externally may remove the discolorations; but it is better not to incur the chance of causing them, than trust to the remote chance of removing them by such an expedient.

The external employment of this agent is not liable to any objection when used cautiously, while its advantages are very great. It is the most powerful *direct antiphlogistic* agent known. All subacute inflammations in any part to which it can be immediately applied will subside under its influence. In inflammations not merely of the skin, but of mucous membranes when they occur in parts which are accessible, its influence is great, and speedily manifested. Many of the cases of croup which in an advanced stage are unmanageable, begin in the back part of the throat (fauces), and if these parts are freely touched with a pencil dipped in a strong solution of nitrate of silver, the farther downward progress of the inflammation may be arrested. The same treatment is applicable to the erythematous inflammation which frequently begins either externally, and spreads through the mouth or nose to the fauces, and thence down the œsophagus, or originates in the fauces, leading to very serious results. Erysipelatous inflammation occurring in any part of the body may be effectually limited by nitrate of silver. For this purpose a complete circle should be formed round the inflamed part, but on the sound skin. For this case the solid cylinder, moistened at the end, is best. The circle must be perfect, or the morbid action may extend, escaping at the smallest breach. Chronic inflammation, and even ulceration of the eyes, may be removed by nitrate of silver applied in different forms. Old indolent ulcers are stimulated to a healthy action by its use; and many cutaneous diseases removed by it. Recent burns have the severe pain often very much mitigated by it; but it must not in any of these cases be applied to too large a surface at once, as ill effects have followed such a practice. To specify all the uses of nitrate of silver would be impossible here, but one more deserves to be extensively known. It is the best application to chilblains, especially at first; but even after they break, it disposes them to heal.

When a solution of nitrate of silver is made, distilled water should invariably be used. The neglect of this rule causes many of the solutions applied to the eye to be not only useless, but hurtful. Oxide of silver has been recently strongly recommended as an antispasmodic, and not liable to the objections which attach to the nitrate.

SILVER, GERMAN. [TUTENAG.]

SILVER-GRAIN. In making a horizontal section of the trunk of any tree, a number of straight lines will be seen radiating from the central pith through the wood to the bark. These rays are called by botanists medullary rays or plates, and by persons who work on wood *silver-grain*. They are composed entirely of cellular tissue, which is of a compressed form, and thence called muriform, and often do not consist of more than a single layer of cells, although in some trees, as Aristolochias, the layers are very numerous. In longitudinal sections of the stem they give it a remarkable satiny lustre, which constitutes the great beauty of some woods, as the plane and the sycamore. The great variety that is seen in the character of different woods appears to depend on the nature of the silver-grain, for the woody and vascular tissues do not present sufficient difference to constitute any obvious peculiarity. Thus in the cultivated cherry the plates are thin, and their adhesion to the bark slight, so that a section of this wood has a pale, smooth, homogeneous appearance: but in the wild cherry the silver-grain is much thicker; it adheres closely to the bark, and is arranged with great irregularity, so that this wood when cut has a deeper colour, and a twisted, knotted, irregular appearance. In the two species of oak the same kind of differences are observable. In Quercus sessiliflora the rays are thin and distant from each other, so that when a wedge is driven into the end of the trunk the plates of wood do not readily break into each other; but in Quercus pedunculata the rays are hard, and are so close together that the wood may be split up without any difficulty. [STEM.]

SILVIC ACID, a substance which with pinic acid [PINIC ACID] constitutes the greater portion of colophony, or common rosin.. When this substance is digested in cold alcohol of specific gravity 0·833, the pinic acid dissolves, but the silvic acid remains insoluble in alcohol until it is boiled; on cooling, it separates in crystals of considerable size, the form of which, according to Unverdorben, is a rhombic prism terminated by four facets, but Laurent represents it as an acute rhomboid, the edges of which are usually serrated.

Silvic acid melts below 212°; is insoluble in water, but dissolves readily in hot alcohol and in æther, and is precepitated by water; it is soluble also in all proportions in the volatile and fixed oils. Concentrated sulphuric acid dissolves and water precipitates it from the acid; by the action of nitric acid it is converted into another resinous acid when it has been precipitated from alcohol by water; ammonia dissolves this acid readily, and the silvate of ammonia formed, as well as that of potash and of soda, is soluble in water; most silvates are however insoluble in it, but many of them are dissolved by alcohol and by æther; the silvate of magnesia especially is taken up by alcohol; the silvates of silver and lead are colourless and insoluble in water.

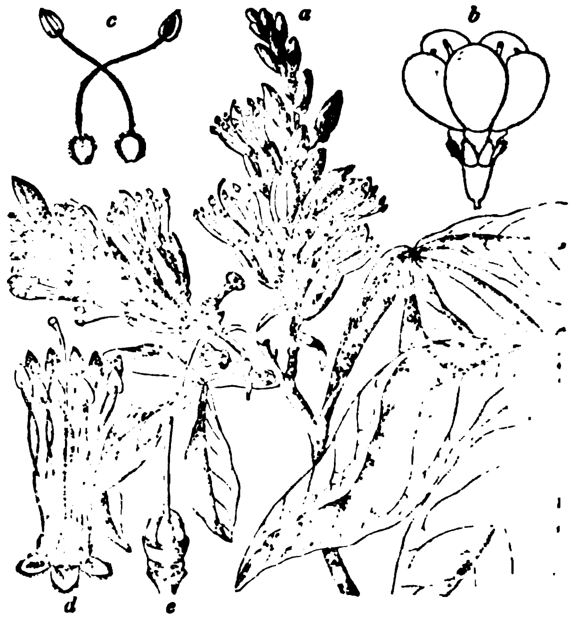
Silvic acid may be regarded as an oxide of oil of turpentine; its composition, as stated by the chemists above named, is as follows: it will be observed that there is no great difference between them, but they do not agree as to its constitution:—

	Unverdorben.	Laurent.	Equivalents.		
Hydrogen .	10·36	9·7	or 40 . .	= 40	10·2
Carbon . .	79·28	79·7	„ 52 . .	= 312	79·6
Oxygen . .	10·36	10·6	„ 5 . .	= 40	10·2
	100·	100·		392	100·

SIMARU'BA is the bark of the root of the Simaruba amara (Aublet), S. officinalis (of Dec. and 'Pharm. Lond.'), a tall tree, native of Guayana, and also of Jamaica, if the tree found in that island be not a distinct species. It is imported in bales containing pieces a foot or more in length, tolerably broad, and generally formed into rolls the whole length of the piece. Externally it is rough, warty, and has a dirty-yellow cuticle marked with transverse ridges: the epidermis below this is of a whitish-yellow colour. Internally smooth, with a greyish yellow colour. It is devoid of odour, but intensely bitter. Its chief constituents are *quassite*, resin a volatile oil having an odour like benzoin, ulmin, mucilage, and some salts. It is tonic and demulcent in small doses, and therefore useful in the later stages of dysentery, but in larger doses it is emetic. The bark of the root of Simaruba versicolor (St. Hilaire) is very like that above described, and is used externally by the Brazilians as a wash to ill-conditioned ulcers, and to destroy vermin; but if taken internally it causes stupor and other narcotic symptoms; it should therefore be carefully distinguished from the former.

SIMARUBA'CEÆ, a natural order of plants belonging to the gynobasic group of polypetalous Exogens. The plants of this order are trees or shrubs, with alternate exstipulate usually compound leaves, and mostly without dots. The flowers are whitish-green or purple, on axillary or terminal peduncles, hermaphrodite, or occasionally unisexual. The calyx is 4 or 5 parted; petals four to five, twisted in æstivation; stamens twice as many as the petals, arising from the back of an hypogynous scale; ovary 4 to 5 lobed; style simple; stigma 4 or 5 lobed; fruit a drupe; seeds pendulous, exalbuminous, with a superior short radicle drawn back within thick cotyledons. With one exception they are all natives of Africa, India, and tropical America. This order was formerly included under Rutaceæ, but their differences from that order appear to many of sufficient importance to constitute a separate family. A. de Jussieu says, 'They are known from all Rutaceous plants by the coexistence of these characters, namely, ovaries with but one ovule, indehiscent drupes, exalbuminous seeds, a membranous integument of the embryo, and by the radicle being retracted within thick cotyledons.'

The plants of this order are all intensely bitter. The Quassia on this account is used in medicine. [QUASSIA.] Simaruba versicolor is so bitter that no insects will attack it; and when all other specimens of plants in dried collections have been attacked by *Ptini*, &c., specimens of this plant have been left untouched. The Brazilians use an infusion of this plant in brandy as a remedy against the bites of serpents.



Quassia amara.

a, branch, showing flowers and compound leaves; *b*, flower; *c*, stamens separated, attached to hypogynous scale; *d*, stamens surrounding ovary; *e*, ovary seated on a stalk, to which the stamens are attached.

SIMBIRSK, a government of Asiatic Russia, is situated between 52° and 57° N. lat., and between 42° 20′ and 50° 20′ E. long. It is bounded on the north by Kasan, on the east by Orenburg, on the south by Saratow and Pensa, and on the west by Nischnei Novgorod. The area is 24,000 square miles. The surface is in general an undulating plain, but on the right bank of the Volga there is a range of hills, composed of clay, marl, limestone, and freestone, which rise to the height of 400 feet. The principal river of this government is the Volga, which enters it from Kasan, about the middle of the northern frontier, and runs in a direction nearly south to Stavropol, where it turns to the east; and there, after being joined by the Sok, coming from Orenburg, it makes a semicircular bend, and at Samara turns due west, in which direction it proceeds as far as the town of Sysran, when it again turns to the south. It is at this bend that the eminences on the Volga are highest, though they accompany the river in its whole course from north to south. Beyond the bend the surface of the country becomes flat and assumes a character resembling that of the steppe. All the rivers belong to the system of the Volga, which receives on the right the Oka and the Syzran, and on the left the Tcheremshan, the Bolshoi Irgis, together with the Kondurtcha, and the Samara. The Sviaga, running parallel to the Volga from south to north, joins that river in the government of Kasan; and the Sura, which is navigable in spring, comes from Penza, traverses the western part of the government, and joins the Volga in the government of Nishnei Novgorod. The lakes and rivers are vast in number, but they are all small. The climate is generally healthy; but the winter is very cold, and the summer very hot. The Volga is usually frozen for five months in the year.

The soil is generally fertile, consisting of a good black mould, which requires no manure. It is pretty carefully cultivated, and produces more corn than is wanted for the home consumption. The principal species of grain are rye, wheat, and spelt; but there are likewise oats, barley, millet, and buckwheat. The inhabitants cultivate also the poppy, peas, lentils, flax, much hemp, tobacco, and some potatoes. Horticulture is in a very backward state: none but the most ordinary kinds of culinary vegetables are grown, and the fruit is of bad quality. In the northern parts of the government there are extensive forests; but in the south they scarcely suffice for the supply of the inhabitants. Though there are good pastures, the breeding of cattle is not much attended to, except among the Calmucks, in the district of the circle of Stavropol. The rich Calmucks have one hundred horses, as many oxen, and four hundred sheep. The Tartars apply to agriculture with great success. Game is pretty abundant, but the fur-bearing animals are scarce. The fisheries of various kinds in the Volga are productive. The minerals are alabaster, sulphur, and limestone; but neither salt nor metals, except some iron.

The population amounts to 1,290,000, of whom about 1,050,000 are Russians and Cossacks: the remainder may be estimated as Tartars 80,000, Tchouvasses 47,000, Mordwins 45,000, Tcheremisses 2000, Calmucks 3000, and Kasalbasches 2000. These numbers are of course only approximative. Not only the Russians, but most of the Tchouvasses, the Tcheremisses, and the Mordwins, profess the Greek religion: some few are still adherents to Shamanism; and the Tartars and Kasalbasches are Mohammedans.

Though agriculture is the chief occupation of the inhabitants, there are some manufactures both in the country and in the towns; they are woollen cloths, blankets, carpets, sail-cloth, leather, and some of silk and nankeen. Glass-ware, soap, and candles are also manufactured; and there are many brandy-distilleries. A great improvement in the manufactures has been made of late years. The exports consist of horses, oxen, hemp, apples, water-melons, in good years corn, fish, tallow, leather, raw hides, and millstones. The principal trading towns are Simbirsk and Samara. The schools in this government are under the university of Kasan; but they are very few, and only a small proportion of the inhabitants receive any education. The government endeavours to remedy this want by establishing every year some new schools.

SIMBIRSK, the capital of the government, is situated near the junction of the Sviaga and the Volga, on the right bank of the latter river. It stands on an eminence which commands a fine view of the Volga and over an immense extent of country uninterrupted by forests. The town is not regularly built, but there are some broad and straight streets. Almost all the houses are of wood, but neat and convenient within. The churches, 16 in number, are all of stone, except one, which is of wood. There are two monasteries, a gymnasium, and manufactories of candles and soap, and some tanneries. The town is in a very fertile plain, and on one side there are gardens and orchards. The population amounts to 13,000, who are in general in easy circumstances; but even the higher classes are without intellectual resources. Of the other towns the most considerable are the following:—1, Syzran, on the river of the same name, not far from its junction with the Volga, has 7000 inhabitants (Schnitzler says 9000); 2, Samara, on the Volga, beyond the bend which it makes here, is a trading town, with 6000 inhabitants, which was built in 1591 as a defence against the Calmucks; 3, Stavropol, the chief town of the Calmucks, on the right bank of the Volga, was built expressly for these people, on their conversion to Christianity, about the year 1737. In the centre is a kind of fort, surrounded with palisades, which is the residence of the chief of the Calmucks. The Russian or Cossack garrison is in the upper town. The merchants reside together in a slobod, and the artisans in the lower town.

SIMEON STYLITES. [MONASTICISM.]

SIMEON SETH (Συμεὼν Σήθ), or SIMEON SETHUS, i.e. Simeon the Son of Seth, the author of several Greek works still extant, lived at Constantinople towards the end of the eleventh century. He held there the office of *Πρωτοβεστιάριος*, or 'Master of the Wardrobe,' in the palace of Antiochus, from whence originated his title *Magister Antiochus*, and this gave occasion to the false opinion that he was born at Antioch. His office appears to have given him the charge of the imperial jewels, which were kept in the palace named after the Eunuch Antiochus, who was consul A.D. 431. (Du Cange, *Glossar. Med. et Inf. Græcit.*, tom. i., p. 794, ed. Lugd., 1688, and *Constantinop. Christ.*, lib. ii., cap. 16, § 5, p. 159, ed. Lutet. Paris., 1680.) Having taken the part of the unfortunate patrician Delassenus against the usurper Michael of Paphlagonia, the latter banished him from Constantinople, A.D. 1035. He retired to Thrace, and founded on Mount Olympus a monastery, in which he composed several works, and peaceably ended his days. (Georg. Cedreni *Histor. Compend.*, p. 737, ed. Paris, 1647.) Some time after the foundation of this monastery, Michael Ducas having ascended the throne, A.D. 1071, Simeon Seth dedicated to him his work entitled *Σύνταγμα κατὰ στοιχεῖον περὶ τροφῶν δυνάμεων*, 'Syntagma de Cibariorum Facultate.' This contains an alphabetical list of eatable things and their properties, according to the opinions of Greek, Persian, Agarenian (or Arabian), and Indian physicians; and is the more valuable as at that time the trade with the East, and the seeking after foreign and costly articles of food at Constantinople, were very extensive. It is compiled chiefly from the treatise of Michael Psellus on the same subject, and shows us that the Greeks were beginning already to learn Materia Medica from the Arabians, to whom in return they imparted their theories. Simeon Seth also goes through the medicines then in use in alphabetical order, and he explains their mode of action according to the elementary qualities of Galen, and their different degrees. He says that Asparagus had been for some time introduced as an article of food (p. 4, ed. Gyrald.); and that it possessed great medicinal virtues. He is the first who speaks of yellow Amber (ἤλεκτρον) which comes from a town in India, and which is the best; and also of Ambergris, which is an animal production, coming from fish (p. 8). Apricots (βερίκοκκα), he says, are indigestible and produce putrefaction of blood (p. 9). His work contains the first description of Camphor, which he says is the resin of a very large Indian tree; that it is cold and dry in the third degree; and that it is used with much advantage in acute diseases, especially in inflammations (p. 35). He is also the first who speaks of Musk, of which the best is of a yellow colour and comes from a town in the east of Khorasan; the black musk comes from India: the properties attributed to this medicine are the same as those given to it in the present day (p. 61). The best Cinnamon comes from Mosul (p. 42). This work was first published, Basil., 1538, Gr. and Lat., 8vo., ed. Lilius Greg. Gyraldus, ap. Mich. Isingrinium. The Latin translation was improved and published separately, Basil., 1561, 8vo., ed. Domin. Monthesaurus, ap. Pet. Pernam. The last and best edition was published Paris, 1658, Gr. and Lat., 8vo., ed. Mart. Bogdan, ap. Dion. Bechet et Lud. Billanium.

Another of his works, entitled '*Σύνοψις καὶ Ἀπάνθισμα φυσικῶν τε καὶ φιλοσόφων δογμάτων*,' 'Compendium et Flores Naturalium et Philosophorum Placitorum,' is still in MS. in several European libraries. A long account of it (extracted from Allatius, 'De Simeonum Scriptis') is given by Fabricius (*Biblioth. Gr.*, tom. xi., p. 323-326, ed. Harles).

But Simeon Seth is better known in the history of literature than in that of medicine, as having translated from the Arabic into Greek the work known under the name of 'Pilpay's Fables,' in which 'fifteen moral and political sentences' (says Gibbon, *Decline and Fall*, chap. 42) 'are illustrated in a series of apologues; but the composition is intricate, the narrative prolix, and the precept obvious and barren.' An account of the history, translations, and editions of this ancient and curious work is given under BIDPAI. (See also Fabricius, *loco cit.*; and Milman's note in Gibbon, vol. vii., p. 319.) He is also said to have translated from the Persian a fabulous history of Alexander the Great, which at present exists, says

Warton (*Hist. of English Poetry*, vol. i., p. 129), under the adopted name of Callisthenes, and is no uncommon manuscript in good libraries. It is entitled Βίος Ἀλεξάνδρου τοῦ Μακεδόνος καὶ Πράξεις, 'De Vita et Rebus Gestis Alexandri Macedonis;' and a long passage from the beginning of the work is quoted by Abr. Berkel in the notes to Stephanus Byzantinus (*in v.* Βουκεφάλεια), and by Fabricius, *Biblioth. Gr.*, tom. xiv., p. 148-150 (ed. Vet.). This fabulous narrative is full (as might be expected) of prodigies and extravagancies, some specimens of which are given by Warton. Of all the romances on the subject of Alexander the Great, this by Simeon Seth was for some centuries the best known and the most esteemed; and it was most probably (says he) very soon afterwards translated from the Greek into Latin, and at length from thence into French, Italian, and German. The Latin translation was printed at Colon. Argentorat., 1489; perhaps before, for in the Bodleian Library there is an edition in 4to., without date, supposed to have been printed at Oxford, by Fred. Corsellis, about the year 1468. It is said to have been made by one Æsopus, or by Julius Valerius; supposititious names, which seem to have been forged by the artifice or introduced through the ignorance of scribes and librarians. This Latin translation however is of high antiquity in the middle age of learning; for it is quoted by Gyraldus Cambrensis, who flourished about the year 1190. It was translated into German by John Hartlieb Muller, a German physician, at the command of Albert, duke of Bavaria, and published at August. Vindel., fol., 1478. Scaliger also mentions (*Epist. ad Casaubon.*, 113, 115) a translation from the Latin into Hebrew by one who adopted the name of Joseph Gorionides, called Pseudo Gorionides.

SIMEON OF DURHAM, an English historical writer who lived about the beginning of the eleventh century. He was a teacher of mathematics at Oxford, and was afterwards precentor in Durham cathedral. He wrote a history of the kings of England from 616 to 1130, for which he was at great pains to collect materials, especially in the North of England, where the Danes had established themselves. The work was continued to 1156 by John, prior of Hexham. Simeon of Durham is supposed to have died soon after 1130, when his history terminates. This work is included in Twysden's 'Anglicanæ Historiæ Scriptores Decem.' Simeon also wrote a history of Durham cathedral, which was published in 1732: 'Historia Ecclesiæ Dunhelmensis, cui præmittitur T. R. Disquisitio de Auctore hujus Libelli; edidit T. Bedford,' Lond., 1732, 8vo.

SIMFEROPOL, the seat of the Russian government of Taurida, is situated in 45° 12′ N. lat. and 24° 8′ E. long., on an elevated plateau on the river Salgir. Simferopol is a modern town. There was indeed on this spot, in the time of the Khans, a place called Akmetschet (the white church), and sometimes called Sultan Serai, but it was of little importance, and now forms a small part of Simferopol, under the name of the Tartar quarter. The antient capital of the Khans was Baktschiserai, but it is confined to a small space in a rocky valley. The Russians, who love everything spacious and open, left that town to the Tartars, and built at Simferopol a capital according to their own taste, with immensely long and broad streets, in which horse-races might be held without interrupting the usual traffic. Being near the centre of the peninsula, it is well calculated for the seat of government. There are many pretty houses, with iron roofs painted green and adorned with many columns, like all the new Russian towns. Besides the government offices there are a Russian church, a pretty German church, one Greek and one Armenian church, four Tartar chapels, a gymnasium, and a seminary for Tartar schoolmasters. The population, about 6000 inhabitants, is a medley of Russians, Tartars, Armenians, Greeks, and 40 or 50 German families. There is here a very good botanic garden, or more properly speaking, a nursery where all kinds of useful plants, shrubs, and trees are cultivated, and sent to various parts of the empire. The town has no manufactures, and has only an inconsiderable trade by land, and scarcely any by sea. The immediate vicinity of the town does not produce much fruit or culinary vegetables. During the hot season fevers are very prevalent, and the water is very indifferent. Usewoloiski (as quoted by Hassel in 1821) makes the number of inhabitants 20,000; we imagine this is a misprint for 2000, for Stein in the same year gives 1800, and no subsequent account that we have seen states it above 6000. (Hassel; Hörschelmann; Kohl, *Reise in Süd Russland*, 1841.)

SI'MIADÆ, the name of a quadrumanous family of mammals. [APE; ATELES; BABOON; CHEIROPODA; CHIMPANZEE; HYLOBATES; LAGOTHRIX; MYCETES; NASALIS; ORANG-UTAN; QUADRUMANA; SAKIS; SAPAJOUS; SEMNOPITHECUS, &c.]

These animals were known at a very early period. The *Kophim* of the Scriptures (1 *Kings*, x. 22; 2 *Chron.*, ix. 21), the *Ceph* of the Ethiopians, the *Keibi* and *Kubbi* of the Persians, the κῆβοι of the Greeks, and *Cephi* of the Romans, were clearly apes. They are to be traced in some of the earliest paintings of the Egyptians. (Rosellini, &c.)

In the garden of the Zoological Society of London, among a great variety of the *Simiadæ*, three of the forms which approach nearest to the human race may now (Sept., 1841) be studied; for three Chimpanzees (two males and a female), an Orang-Utan, and a Gibbon (*Hylobates agilis*)—the two latter females—are all living at the menagerie in the Regent's Park.

The *Cephi* exhibited by Pompey (Pliny, *Nat. Hist.*, viii. 19), as well as those shown by Cæsar, appear to have been Ethiopian apes; and in the Greek name inscribed near the quadrumanous animals, in the Prænestine pavement, the oriental origin of the word is apparent. It is remarkable that the name *Cebus* [SAPAJOUS] is applied by modern zoologists to a genus of monkeys which could not have been known to the antients; for the *Cebi* of our present catalogues are exclusively American.

FOSSIL SIMIADÆ.

Remains of *Simiadæ* have been discovered and described from the tertiary formations of India, France, England, and Brazil. These fossils are illustrative of four of the existing types of quadrumanous, or rather Simious form. Thus we have *Semnopithecus* from India; *Hylobates* from the south of France; *Macacus* from Suffolk; and *Callithrix*, peculiar to America, found in Brazil. Nor is it unworthy of remark, that we here have evidence that so high a quadrumanous form as the Gibbon, a genus in which the skull is even more approximated to that of man than it is in the Chimpanzee, was living upon our globe with the Palæothere, Elephants, and other Pachyderms. We say that the skull of the Gibbon comes nearest to that of man; because, though the cranium of the young Chimpanzee approaches that of the human subject, it is far removed from it when the permanent teeth are developed.

From these evidences we have also proof that *Simiadæ* lived in our island during the Eocene period; whilst the presence of fossil vegetables, abundant in the London clay at Sheppy, and the remains of serpents in the same locality, show the degree of heat that must have prevailed here during that period, when *Simiadæ* were co-existent with tropical fruits and Boa Constrictors.

But Dr. Lund's observations relating to the extinct quadrumanous form detailed in his 'View of the Fauna of Brazil,' previous to the last geological revolution, require special notice. He states that it is certain that the family of *Simiadæ* was in existence in those antient times to which the fossils described by him belong; and he found an animal of that family of gigantic size, a character belonging to the organization of the period which he illustrates. He describes it as considerably exceeding the largest Oran-Utan or Chimpanzee yet seen; from those, as well as from the long-armed apes (*Hylobates*), he holds it to have been generically distinct. As it equally differs from the *Simiadæ* now living in the locality where it was discovered, he proposes a generic distinction for it under the name of *Protopithecus*, and the specific appellation of *Protopithecus Brasiliensis*.

As connected with this discovery, Dr. Lund records a tradition existing very generally over a considerable extent of the interior highlands, especially in the northern and western portions of the province of S. Paul and the Sertão of S. Francisco. According to this tradition, that district is still inhabited by a very large ape, to which the Indians, from whom the report comes, have given the name of *Caypore*, or *Dweller in the Wood*. This *Caypore* is said to be of man's stature, but with the whole body and part of its face covered with long curly hair; its colour brown, with the exception of a white mark on the belly immediately above the navel. It is represented as climbing trees with great facility, but most frequently going on the ground, where it walks upright like a man. In youth it is held to be a quiet inoffensive animal, living upon fruits, as which it feeds with teeth formed like those of the human race; but as it advances in age, its character is determined as rapacious and blood-thirsty. Then it pursues birds and small quadrupeds; large canine teeth project from its mouth, and it becomes formidable to man. Its skin is supposed to be impenetrable to ball, with the exception of the white spot on the belly. It is an object of dread to the natives, who shun its haunts, which are betrayed by the Caypore's extraordinary footmarks, setting in a foot both before and behind, so that it is impossible to know in what direction the animal is gone.

Upon this tradition Dr. Lund remarks, that it is easy to trace in it the childish embellishments of a savage race; and as little as the alleged double foot, the meaning that the imprint of the fore foot is not broader than the hind, and that the impressions of the two are not distinguishable. As to the white spot on the belly, he remarks that all the long-haired apes now found in Brazil have the central part of the belly very thinly covered with hair, so that when the hair is of a dark colour and the skin light, an effect is produced during the act of respiration as if there was a white spot on the stomach. The impenetrability of its hide, he observes, may seem fabulous, but he states that he is acquainted with a species of this family, the Gonga (*Mycetes* [illegible], Lund), which has this property. This undescribed animal, he adds (which constitutes a remarkable link between *Mycetes* and *Cebus*, inasmuch as it combines the vocal organs of the former with the perfectly hairy tail of the latter), is provided with a skin clothed with such long and felted hair as to be shot-proof on the back and sides. It would seem, says Dr. Lund, to be well aware of its shield; so instead of seeking safety in flight, like other *Simiadæ*, when danger approaches it rolls itself up in a ball, so as to cover the least protected part, and thus defies the shot of the hunter.

Dr. Lund further remarks that he has introduced this tradition, less on account of its zoological interest, than for the striking coincidence it displays in many points with the stories related of the Pongo of Borneo. He asks, if no such animal exists in the district where the tradition is current, whence did it take its origin? Did the Indians receive it from their forefathers? May this tradition be considered one more testimony in favour of the Asiatic origin of the first inhabitants of America? In the Sertão of S. Francisco the tradition is coupled with additions which though, he remarks, they weaken its zoological interest, impart to it another, as betraying the only trace he had met with in that district of a belief in fairy existence. According to the native of Sertão, the Caypore is lord of the wild hogs, and when one of them has been shot, his enraged voice may be heard in the distance, when the hunter quits his game to save himself by flight. The Caypore is said to have been beheld in the centre of a herd of swine riding on the largest, and indeed has been described as an ape above and a hog below.

SIMILAR, SIMILAR FIGURES (*Geometry*). Similarity, resemblance, or likeness, means sameness in some, if not in all, particulars. In geometry, the word refers to a sameness of one particular kind. The two most important notions which the view of a figure will give, are those of *size* and *shape*, ideas which have no connection whatsoever with each other. Figures of different sizes may have the same shape; and figures of different shapes may have the same size. In the latter case they are called by Euclid *equal*, in the former *similar* [illegible]. See this term [EQUAL; RELATION]. In Euclid's first use of it he includes total sameness, both of size and shape; but he soon drops the former notion, and, reserving equal to signify sameness of size only, introduces the word similar to denote sameness of form; so that the equality of the fundamental definition is the subsequent combined equality and similarity of the sixth book.

Similarity of form, or, as we shall now technically say, similarity, is a conception which is better defined by things than by words; being in fact one of our fundamental ideas of figure. A drawing, a map, a model, severally appeal to a known idea of similarity, derived from, it may be, or at least nourished by, the constant occurrence in nature and art of objects which have a general, though not a perfectly mathematical, similarity. The rudest nations understand a picture or a map almost instantly. It is not necessary to dwell, in the way of definition, and we must proceed to point out the mathematical tests of similarity. We may observe indeed that errors or misstatements of size are always more bearable than those of form, so much more do our conceptions of objects depend upon the latter than the former. A painter is even obliged to diminish the size of the minor parts of his picture a little, to give room for the more important objects: but no one ever thought of making a change of form, however slight, in one object, for the sake of its effect on any other. The giant of Rabelais, with whole nations carrying on the business of life inside his mouth, is not so monstrous as it would have been to take the ground on which a nation might dwell, England, France, or Spain, invest it with the intellect and habits of a human being, and make it move, talk, and reason; the more tasteful fiction of Swift is not only bearable and conceivable, but has actually made many a simple person think it was meant to be taken as a true history.

Granting then a perfect notion of similarity, we now ask in what way it is to be ascertained whether two figures are similar or not. To simplify the question, let them be plane figures, say two maps of England of different sizes, but made on the same projection. It is obvious, in the first place, that the lines of one figure must not only be related to one another in length in the same manner as in the other, but also in position. Let us drop for the present all the curved lines of the coast, &c., and consider only the dots which represent the towns. Join every such pair of dots by straight lines: then it is plain that similarity of form requires that any two lines in the first should not only be in the same proportion, as to length, with the two corresponding lines in the second, but that the first pair should incline at the same angle to each other as the second. Thus, if LY be the line which joins London and York, and FC that which joins Falmouth and Chester, it is requisite that LY should be to FC in the same proportion in the one map that it is in the other; and if FC produced meet LY produced in O, the angle COY in one map must be the same as in the other. Hence, if there should be 100 towns, which are therefore joined two and two by 4950 straight lines, giving about 12 millions and a quarter of pairs of lines, it is clear that we must have the means of verifying 12¼ millions of proportions, and as many angular agreements. But if it be only assumed that similarity is a possible thing, it is easily shown that this large number is reducible to [illegible]. For let it be granted that *ly* on the smaller map is to represent LY on the larger. Lay down *f* and *c* in their proper places on the smaller map, each with reference to *l* and *y*, by comparison with the larger map: then *f* and *c* are in their proper places with reference to each other. For if not, one of them at least must be altered; which would disturb the correctness of it with respect to *l* and *y*. Either then there is no such thing as perfect similarity, or else it may be entirely obtained by comparison with *l* and *y* only.

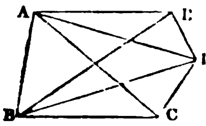
We have hitherto supposed that both circumstances must be looked to; proper lengths and proper angles; truth of linear proportion and truth of relative direction. But it is one of the first things which the student of geometry learns (in reference to this subject), that the attainment of correctness in either secures that of the other. If the smaller map be made true in *all* its relative lengths, it must be true in all its directions: if it be made true in *all* its directions, it must be true in all its relative lengths. The foundation of this simplifying theorem rests on three propositions of the sixth book of Euclid, as follows:—

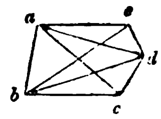
1. The angles of a triangle (any two, of course) alone are enough to determine its form: or, as Euclid would express it, two triangles which have two angles of the one equal to two angles of the other, each to each, have the third angles equal, and all the sides of one in the same proportion to the corresponding sides of the other.

2. The proportions of the sides of a triangle (those of two of them to the third) are alone enough to determine its form: or if two triangles have the ratios of two sides to the third in one, the same as the corresponding ratios in the other, the angles of the one are severally the same as those of the other.

3. One angle and the proportion of the containing sides are sufficient to determine the form of a triangle: or, if two triangles have one angle of the first equal to one of the second, and the sides about those angles proportional, the remaining angles are equal, each to each, and the sides about equal angles are proportional.

From these propositions it is easy to show the truth of all that has been asserted about the conditions of similarity, and the result is, that any number of points are placed similarly with any other number of points, when, any two being taken in the first, and the corresponding two in the second, say A, B, and *a*, *b*, any third point C of the first gives a triangle ABC, which is related to the corresponding triangle *abc* of the second, in the manner described in either of the three preceding propositions. For instance, let there be five points in each figure:

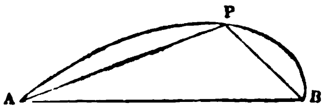


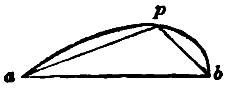


In the triangles BAE and *bae*, let the angles AEB and EBA be severally equal to *aeb* and *eba*. In the triangles ADB and *adb* let DA : AB :: *da* : *ab*, and DB : BA :: *db* : *ba*. In the triangles ACB and *acb* let the angles ABC and *abc* be equal, and AB : BC :: *ab* : *bc*. These conditions being fulfilled, it can be shown that the figures are similar in form. There is no angle in one but is equal to its corresponding angle in the other; no proportion of any two lines in one but is the same as that of the corresponding line in the other. Every conception necessary to the complete notion of similarity is formed, and the one figure, in common language, is the *same* as the other in *figure*, but perhaps on a different scale.

The number of ways in which the conditions of similarity can be expressed might be varied almost without limit; if there be n points, they are twice $(n-2)$ in number. It would be most natural to take either a sufficient number of ratios, or else of angles: perhaps the latter would be best. Euclid confines himself to neither, in which he is guided by the following consideration:—He uses only salient or convex figures, and his lengths, or sides, are only those lines which form the external contour. The internal lines or diagonals he rarely considers, except in the four-sided figure. He lays it down as the definition of similarity, that all the angles of the one figure (meaning only angles made by the sides of the contour) are equal to those of the other, each to each, and that the sides about those angles are proportional. This gives $2n$ conditions in an n-sided figure, and consequently four redundancies, two of which are easily detected. In the above pentagons, for instance, if the angles at A, E, D, C, be severally equal to these at *a*, *e*, *d*, *c*, there is no occasion to say that that at B must be equal to that at *b*, for it is a necessary consequence: also, if BA : AE :: *ba* : *ae*, and so on up to DC : CB :: *dc* : *cb*, there is no occasion to lay it down as a condition that CB : BA :: *cb* : *ba*, for it is again a consequence. These points being noted, the definition of Euclid is admirably adapted for his object, which is, in this as in every other case, to proceed straight to the establishment of his propositions, without casting one thought upon the connection of his preliminaries with natural geometry.

Let us now suppose two similar curvilinear figures, and to simplify the question, take two arcs AB and *ab*. Having already detected the test of similarity of position with reference to any number of points, it will be easy to settle the conditions under which the arc AB is altogether similar to *ab*. By hypothesis, A and B are the points corresponding to *a* and *b*. Join A, B, and *a*, *b*; and in the arc AB take any point P. Make the angle *bap* equal to BAP, and *abp* equal to ABP; and let *ap* and *bp* meet in *p*. Then, if the curves be similar, *p* must be on the arc *ab*; for every point on AB is to have a corresponding point on *ab*. Hence the definition of similarity is us follows:—Two curves are similar when for every polygon which can be inscribed in the first, a similar polygon can be inscribed in the second.





It is easily shown that if on two lines, A and *a*, be described a first pair of polygons, P and *p*, and a second pair, Q and *q*, the proportion of the first and second pairs is the same, or P : *p* :: Q : *q*. The simplest similar polygons are squares; consequently, any similar polygons described on A and *a* are to one another in the proportion of the squares on A and *a*. This is also true if for the polygons we substitute similar curves; and it must be proved by the method of exhaustions [Geometry, p. 154], or by the theory of limits applied to the proposition, that any curve may be approached in magnitude by a polygon within any degree of nearness.

The theory of similar solids resembles that of similar polygons, but it is necessary to commence with three points instead of two. Let A, B, C, and *a*, *b*, *c*, be two sets of three points each, and let the triangles ABC and *abc* be similar: let them also be placed so that the sides of one are parallel to those of the other. If then any number of similar pyramids be described on ABC and *abc*, the vertices of these pyramids will be the corners of similar solids. If P and *p* be the vertices of one pair, then the pyramids PABC and *pabc* are similar if the vertices P and *p* be on the same side of ABC and *abc* [Symmetry], and one of the triangles, say PAB, be similar to its corresponding triangle *pab*, and so placed that the angle of the planes PAB and CAB is the same as that of the planes *pab* and *cab*. The simplest similar solids are cubes; and any similar solids described on two straight lines are in the same proportion as the cubes on those lines. Similar curve surfaces are those which are such that every solid which can be inscribed in one has another similar to it, capable of being inscribed in the other.

It is worthy of notice that the great contested point of geometry [Parallels] would lose that character if it were agreed that the notion of form being independent of size, is as necessary as that of two straight lines being incapable of enclosing a space; so that whatever form can exist of any one size, a similar form must exist of every other. There can be no question that this universal idea of similarity involves as much as this, and no more; that in the passage from one size to another, all lines alter their lengths in the same proportion, and all angles remain the same. It is the subsequent mathematical treatment of these conditions which first points out that either of them follows from the other. If the whole of this notion be admissible, so in any thing less; that is, the admission implies it to be granted that whatever figure may be described upon any one line, another figure having the same angles may be described upon any other line. If then we take a triangle ABC, and any other line *ab*, there can be drawn upon *ab* a triangle having angles equal to those of *abc*. This can only be done by drawing two lines from *a* and *b*, making angles with *ab* equal to BAC and ABC. These two lines must then meet in some point *c*, and the angle *acb* will be equal to ACB. If then two triangles have two angles of one equal to two angles of the other, each to each, the third angle of the one must be equal to the third angle of the other; and this much being established, it is well known that the ordinary theory of parallels follows. The preceding assumption is not without resemblance to that required in the methods of Legendre. [Parallels.]

SI'MILE is admirably defined by Johnson to be 'a comparison by which anything is illustrated or aggrandised,' a definition which has been often neglected by poets. A Metaphor differs from a Simile in expression, inasmuch as a metaphor is a comparison without the words indicating the resemblance, and a simile is a comparison where the objects compared are kept as distinct in expression as in thought. Dr. Thomas Brown has well said, 'The metaphor expresses with rapidity the analogy as it rises in immediate suggestion, and identifies it, as it were, with the object or emotion which it describes; the simile presents not the analogy merely, but the two analogous objects, and traces their resemblances to each other with the formality of regular comparison. The metaphor, therefore, is the figure of passion; the simile the figure of calm description.' (*Lectures*, xxxv.) The metaphor is only a bolder and more elliptical simile. When we speak of the rudeness of a man, and say 'Mr. Jones is as rude as a bear,' we use a simile, for the rudeness of the two are kept distinct but likened; when we say 'that *bear* Mr. Jones,' we use a metaphor, the points of resemblance being confounded in the identification of rudeness with a bear. So, 'brave as a lion' is a simile—the 'lion Achilles' a metaphor. Where the resemblance is obvious, it may be more forcibly and as intelligibly expressed by a simple metaphor; but when the resemblance is not so obvious, it requires fuller elucidation, and then it must be expressed by a simile. Similes therefore, from their tendency to detail, are usually misplaced in passionate poetry, but metaphors constitute the very language of passion; for the mind, when moved, catches at every slight association to express itself, but never dwells on them with the deliberateness of a comparison.

Poets should never forget that similes are not used for their own sake, but for the sake of 'illustrating or aggravating' the object or emotion they would express: hence an important but overlooked canon of criticism. Metaphors may be indefinite, for they are themselves the expressions of strong and half-formed emotions; but similes must be uniformly definite, clear, and correct, otherwise they are useless, for the simile is used to illustrate, by a known object, one unknown or indescribable: hence the necessity for its being intelligible. Moreover, images addressed to the eye must be such as are visually clear. These rules are continually violated by minor poets, but there are few cases of such violation in the greater poets, and even these are exceptions and prove the rule.

SIMMENTHAL. [Berne.]

SIMMIAS was a native of Thebes, and is said to have been a disciple of Philolaus. He was a friend of Socrates (Plat., *Crito*, p. 45 B), and is introduced by Plato as one of the speakers in his 'Phaedon.' Diogenes Laertius (ii. 16, 124) mentions the titles of twenty-three dialogues which were in his time attributed to Simmias (Suidas, s. v. Σιμμίας), but none of his works have come down to us.

A second SIMMIAS, a grammarian, was a native of Rhodes, and probably lived about the year 300 B.C. He is said to have written a work on languages, consisting of three books, and a collection of miscellaneous poems, consisting of four books. (Suidas, s. v. Σιμμίας; Strabo, xiv., p. 655.) Some of his poems, which however are of little value, are contained in the 'Anthologia Graeca.' (Compare Athen., vii., p. 327; xi., p. 472, and 491.)

A third SIMMIAS, who lived about the commencement of the Olympiads, wrote a work called 'Ἀρχαιολογία τῶν Σαμίων,' of which nothing has come down to us. Suidas confounds this historian with Simmias the grammarian.

SIMNEL, LAMBERT. [Henry VII.]

SIMOIS, River. [Troas.]

SIMON MACCABAEUS, or MATTHES, surnamed Thassi, was the second son of Mattathias, and brother of Judas Maccabaeus and Jonathan Apphus. Mattathias, when dying, recommended him to his brethren as their counsellor (1 *Macc.*, ii. 65). He distinguished himself on several occasions during the lives of Judas and Jonathan (1 *Macc.*, v. 17; x. 74; 2 *Macc.*, viii. 22; xiv. 17). Under the latter he was made, by Antiochus Theos, governor over the coast of the Mediterranean from Tyre to the frontier of Egypt (1 *Macc.*, xi. 59); and here he took the fortified towns of Bethsura and Joppa, and founded Adida, in the plain of Sephela. (1 *Macc.*, xi. 65; xii. 33, 38.)

After the treacherous seizure of Jonathan by Trypho [Jonathan Apphus], Simon was chosen by the people as their chief (1 *Macc.*, xiii.); and, according to Josephus (*Antiq.*, xiii. 6, § 7), as high-priest also. After putting Jerusalem in a state of defence, he marched out to meet Trypho, who did not venture to give him battle, and who was soon after compelled to retreat into winter-quarters in Gilead, where he murdered Jonathan and his two sons. Simon recovered his brother's corpse, and interred it in his father's sepulchre at Modin, and built over it a magnificent mausoleum, which was standing in the time of Eusebius. About the time (B.C. 142) Trypho had murdered Antiochus, and proclaimed himself king. Simon immediately declared for his competitor, Demetrius Nicator, with whom he made a most favourable treaty, whereby Simon was recognised prince and high-priest of the Jews, all claims upon whom for tribute Demetrius relinquished, and consented to bury in oblivion their offences against him. Thus the Jews became once more free and independent, and they began to reckon from this period (170 Aer. Seleuc.; 143 B.C.) a new civil aera, which is used on the coins of Simon as well as by Josephus and the author of the *First Book of Maccabees* (1 *Macc.*, xiii. 41). The last remains of their bondage to the Syrians were removed in the next year by the surrender of the Syrian garrison in the citadel of Jerusalem.

The succeeding period of peace was employed by Simon in securing and consolidating his power, and improving the condition of his people. He made a harbour at Joppa, [illegible] magazines and armouries, improved the laws and administered them with rigour, restored the religious rites and renewed the treaties of alliance which Jonathan had made with the Romans and Spartans. (1 *Macc.*, xiv. 20.) In the year 141 B.C., the people met at Jerusalem, and registered a public act recounting the services of the house of Mattathias, and recognising Simon and his heirs as perpetual prince and high-priest of the Jews; and this act was afterwards confirmed by Demetrius. (1 *Macc.*, xiv. 35.) After the capture of Demetrius by the Parthians, his successor Antiochus Sidetes renewed the treaty with Simon, allowed him to coin money, and declared Jerusalem a free and holy city. Soon afterwards however Antiochus not only refused to ratify this treaty, but demanded of Simon the surrender of several fortified places, including the citadel on Mount Zion, or the payment of 1000 talents. Simon refused these demands, and Antiochus sent a large army into Palestine, which was soon however driven back by John Hyrcanus and Judas, the sons of Simon (B.C. 139-8). For the next three years the Jews again enjoyed a season of tranquillity, during which Simon occupied himself in inspecting and improving the state of the country. In the course of his tour he visited his son-in-law Ptolemy, at his castle of Doc, where he and his two sons Mattathias and Judas were treacherously put to death by Ptolemy, who aimed at the principality of Judaea (B.C. 135). He was succeeded by his surviving son John Hyrcanus. [Hyrcanus, John; Asmonaeans; Maccabees.]

The coinage of Simon is the first of which we have any historical account among the Jews. [Shekel.]

(Josephus, *Antiq.*; Prideaux's *Connection*; Jahn's *Hebrew Commonwealth*; Winer's *Biblisches Realwörterbuch*.)

SIMON MAGUS, that is, the magician, is mentioned in the *Acts of the Apostles* as having imposed upon the people of Samaria by magical practices. When Philip the Deacon preached the gospel at Samaria, Simon was among those who received baptism at his hands. But when Peter and John came down to Samaria, and Simon perceived that the Holy Ghost was received by those upon whom they laid their hands, he offered them money if they would give him the same power. Peter vehemently rebuked him, and he showed some appearance of penitence (*Acts*, viii. 9-24); but the early Christian writers represent him as afterwards becoming one of the chief opponents of Christianity. According to them he was the founder of the Gnostic heresy, and was addicted to magical practices and to abominable vices. After travelling through several provinces, endeavouring as he went to spread his errors and to damage Christianity as much as possible, he came to Rome, where it is said that he worked miracles which gained him many followers, and obtained for him the favour of Nero. At last, as he was exhibiting in the emperor's presence the feat of flying through the air in a fiery chariot, which he was enabled to perform by the aid of demons, the united prayers of Peter and Paul, who were present on the occasion, prevailed against him, and the demons threw him to the ground. There are also other marvellous stories about his life and doctrines.

(Calmet's *Dictionary*; Winer's *Biblisches Realwörterbuch*; Lardner's *Credibility*.)

SIMON MATTHES. [Simon Maccabaeus.]

SIMON, RICHARD, was born at Dieppe, in Normandy, May 13, 1638. After he had finished his studies, he entered into the Congregation of the Oratory, and became lecturer on philosophy at the College of Juilly. Being summoned by his superiors to Paris, he applied himself to the study of divinity, and made great progress in oriental learning. There being a valuable collection of oriental manuscripts in the Oratory of Rue St. Honoré, Simon was directed to make a catalogue of them, which he did with great skill. In 1668 he returned to Juilly, and resumed his lectures on philosophy, and two years after published his defence of a Jew whom the parliament of Metz condemned to be burned on the charge of having murdered a Christian child ('Factum pour le Juif de Metz,' &c. Paris, 1670). In the following year, with a view to show that the opinions of the Greek church are not materially different from those of the Church of Rome with respect to the Sacrament, he published his 'Fides Ecclesiae Orientalis,' Paris, 1671, 8vo., and 1682, 4to. This work, which is a translation of one of the tracts of Gabriel, metropolitan of Philadelphia, with notes, Simon gave as a supplement to the first volume of the 'Perpetuity of the Faith respecting the Eucharist,' whose authors he accused of having committed many gross errors, and not having sufficiently answered the objections raised by the Protestant minister Jean Claude, in his 'Reponse au Traité de la Perpétuité de la Foi sur l'Eucharistie.' [CLAUDE.] This involved him in a controversy with the writers of Port-Royal, and laid the foundation of that opposition which he afterwards met with from the learned of his own communion. His next publication, which came out under the assumed name of Recared Simeon, was a French translation of the work of Leo of Modena: 'Cérémonies et Coutumes qui s'observent aujourd'hui parmi les Juifs,' Paris, 1674, 12mo. A second edition appeared in 1681, under the name of the Sieur de Simonville, containing also a supplement respecting the Caraites and the Samaritans, and a comparison between the ceremonies of the Jews and the discipline of the Church. In 1675 he published the 'Voyage de Mont Liban,' from the Italian of Dandini, with notes, and about the same time his 'Factum du Prince de Neubourg, abbé de Feschamps, contre les Religieux de cette Abbaye,' in which work, as was usual with him, he took an opportunity to attack the Benedictines. But the work which rendered him most famous is his 'Histoire Critique du Vieux Testament,' which immediately after its publication (Paris, 1678, 8vo.) was suppressed on the ground that it contained doctrines dangerous to religion and the Church. The work however was so much admired for its learning and criticism, that it was reprinted the year after, and translated into Latin at Amsterdam, 1681, and into English at London, 1682, 4to., by John Hampden. After the publication of his 'Histoire Critique,' Simon left the Congregation of the Oratory, and repaired to Belleville, a village near Caux, where he held a curacy; but in 1682 he resigned his office and removed to Dieppe, and thence to Paris to renew his studies and make arrangements for the publication of other works. In 1684 he published at Frankfort, 'Histoire de l'Origine et du Progrès des Revenues Ecclésiastiques,' under the name of Jerome à Costa, of which a second edition appeared at the same place in 1709, in 2 vols. 8vo. In the same year (1684) he printed in London his 'Disquisitiones Criticæ de variis per diversa Loca et Tempora Bibliorum Editionibus,' which was immediately translated into English. In 1688 he published at Frankfort, under the name of John Reuchlin, 'Dissertation Critique sur la Nouvelle Bibliothèque des Auteurs Ecclésiastiques par Du Pin,' in which he defends some opinions contained in his 'Histoire Critique,' which had been controverted by Du Pin. His next publication was 'Histoire Critique du Nouveau Testament,' Rotterdam, 1689, 4to., an English version of which appeared the same year at London. Besides the above, Simon was the author or editor of many other works. He was unquestionably a man of profound learning and great acuteness, and he contributed in no small degree to lessen the authority of his own church; but a love of controversy, in all its bitterness, and too great a propensity to depreciate and abuse those who happened not to acquiesce in his opinions, rendered him equally obnoxious to Protestants and Roman Catholics. He died at Dieppe, in April, 1712, in the seventy-fourth year of his age.

SIMO'NIDES was a native of Iulis, in the island of Ceos, and was born about B.C. 556. His father's name was Leoprepes, and his grandfather's Simonides, who was also a poet.

Simonides is said to have obtained great fame as a poet at an early age. He appears to have remained in Ceos till about B.C. 525, when he removed to Athens, where he was honourably received by Hipparchus, and became acquainted with Anacreon and Lasus (Plato, *Hipparch.*, p. 228; Aelian, *Var. Hist.*, viii. 2). After the murder of Hipparchus, he took refuge with the Aleuadae and Scopadae in Thessaly, whose praises he celebrated in some of his poems (Theocrit., xvi. 34, &c., with the Schol.; compare Plato, *Protagor.*, p. 333). How long Simonides remained in Thessaly is not known; but after the battle of Marathon (B.C. 490) we find him again at Athens. For the next ten years he appears to have lived chiefly at Athens, and to have been actively engaged in the pursuit of his art. After the banishment of Themistocles and the death of Pausanias, with both of whom he lived on intimate terms, he retired to Hieron's court at Syracuse (Aelian, *Var. Hist.*, ix. 1; iv. 15), where he died, B.C. 467, in his ninetieth year.

Most of the poems of Simonides are lost; but enough have come down to us to enable us to form some opinion of the merits of his poetry, and to justify the panegyrics which the antient writers bestow upon him. He was one of the most distinguished of the elegiac poets, and particularly excelled in the pathetic, as we see in his 'Lament of Danae' and in other remains of his poetry. He is stated to have had the superiority over Aeschylus in an elegy which he composed in honour of those who died at Marathon, when the Athenians instituted a contest of the chief poets. But some of Simonides's best poems are epigrams, which species of poetry he carried to greater perfection than any of his predecessors. The Persian war gave constant employment to this muse, as he was frequently employed by the different states of Greece to adorn with inscriptions the tombs of those who fell, and the votive offerings which were dedicated in the various temples. We still possess several of his epigrams belonging to this period. Of these one of the most celebrated is upon the Spartans who fell at Thermopylæ: 'Stranger, tell the Lacedæmonians that we are lying here in obedience to their laws;' and another upon the Athenians who fell at Marathon: 'Fighting in the van of the Greeks, the Athenians at Marathon destroyed the power of the glittering Medians.' Simonides also celebrated the sea-fights of Artemisium and Salamis in two larger poems, which are often referred to by antient writers, but of which no fragments have come down to us.

The remains of the poems of Simonides have been published by Schneidewin, under the the title of 'Simonidis Carminum Reliquiæ,' Bruns., 1835, 8vo. The Greek letters Ξ, Ψ, Ω, are said to have been invented by Simonides, who is also stated to have converted the sign of the aspirate H into a long e.

Simonides of Ceos must not be confounded with Simonides of Amorgus, which is an island not far from Paros. The latter was a contemporary of Archilochus, and flourished from B.C. 693 to 662. He wrote iambics, in which he attacked private persons, and of which a few fragments have come down to us. He also wrote a satirical poem upon women in the iambic metre, which is still extant. The fragments of his poems have been published by Welcker, Bonn, 1835.

(Müller's *History of the Literature of Greece*, p. 125, &c., 140; Bode's *Geschichte der Lyrischen Dichtkunst der Hellenen*, vol. i., p. 318, &c.; vol. ii., p. 122, &c.)

SIMONY is the buying or selling for money or other corrupt consideration any ecclesiastical benefice, dignity, or preferment, or the causing a clerk to obtain or to relinquish such benefice or preferment for corrupt consideration. The word is derived from Simon, who is mentioned in the 'Acts of the Apostles' (viii., 18-24) as having offered money to Peter and John in order that he might obtain from them apostolical powers.

Whether Simony was an offence at common law is at least doubtful. Lord Coke, it is true, repeatedly says that the common law doth abhor Simony, and adduces as evidence of this repugnance the fact that a patron of a living could not by the common law recover a pecuniary compensation for being impeded in his presentation. It is certain that Simony is a great ecclesiastical offence by the canons both of the Roman Catholic and of the Anglican church. The 40th canon of the latter (A.D. 1603), 'to avoid the detestable crime of Simony,' and because the buying and selling of spiritual and ecclesiastical functions, &c. 'is execrable before God,' prescribes an oath to be ministered to every person assuming such offices, by which he denies that he has made any Simoniacal payment, contract, or promise, directly or indirectly, for procuring such ecclesiastical office, or that he will perform any such contract made on his behalf without his knowledge.

But the offence now depends on the statute 31 Elizabeth, c. 6, although the word Simony is not mentioned in the act. By that statute any person presenting to a benefice for profit or 'any such corrupt cause' forfeits to the crown that presentation and double the value of one year's profit of the benefice, and the person paying the price is rendered incapable of holding that benefice (§ 5). Any person so corruptly admitting or instituting another is subject to the like pecuniary penalty, and the benefice is 'eftsoons merely void,' and the presentation reverts to the patron as though the party so admitted were dead (§ 6). An incumbent resigning or exchanging a benefice with cure of souls for profit, and the person with whom the bargain is made, both forfeit double the price, together with two years' profit of the benefice (§ 8). Any person obtaining for such corrupt consideration the ordaining of a minister, forfeits 40*l*., and the minister so corruptly ordained forfeits 10*l*. and is incapable of holding any ecclesiastical preferment for seven years. The modifications which that enactment has undergard to subsequent statutes and decisions will be found under the head Benefice (p. 223-6).

The indignation of ecclesiastical authorities against Simony, excepting in so far as relates to the admission of persons into the ministry, seems somewhat unreasonable, and is certainly inefficacious, for the trafficking in ecclesiastical preferment is extensively pursued. Provided that the qualifications of persons for holy orders is carefully investigated before their admission to the ministry, and that the discipline of the church can be strictly and easily enforced by the bishops and other ecclesiastical authorities, the reason why a minister who has been admitted to a benefice for a pecuniary consideration should be disqualified for his office is not very obvious, especially in a country where advowsons are by law a marketable commodity, and the legislature recognises a bargain for compelling a minister to resign a benefice in favour of another person, provided the latter is within certain degrees of consanguinity to the patron.

(Rogers's *Ecclesiastical Law*; Bacon's *Abridgment*, 'Simony.')

SIMOOM. [Samiel.]

SIMPLE BODIES. [Atomic Theory.]

SIMPLE CONTRACT debts are those which are contracted without any engagement under the seal of the debtor or of his ancestor, and which are not of record by any judgment of a court. Money due for goods bought by the debtor is the most usual of simple contract debts; and the declaration against a defendant, in an action for goods sold, usually alleges that the defendant undertook (or contracted) to pay the plaintiff the sum due. Simple contract debts are the last which are payable out of a deceased person's estate, when the assets are insufficient. [Executor.]

SIMPLI'CIUS, a native of Tibur, succeeded Hilarius as bishop of Rome, A.D. 467. He had a controversy with Acacius, Patriarch of Constantinople, about precedence. Simplicius dedicated several churches at Rome to particular saints, and he also framed several regulations concerning the discipline of the clergy of Rome. He died A.D. 483.

SIMPLI'CIUS was a native of Cilicia, and lived in the reign of Justinian. He had been trained in the study of philosophy by Ammonius, and appears to have been engaged in teaching at Athens when Justinian issued the decree which imposed perpetual silence on the few yet remaining votaries of heathen science and superstition in that city. Simplicius and six of his philosophic friends, who were resolved not to abandon the religion of their forefathers, left Athens, to seek in a foreign land the freedom which was denied to them at home. They went to Persia, where Chosroes then reigned, expecting to find all their hopes realised; but when they saw the actual state of affairs in the East, they repented of the steps which they had taken, and declared that they would rather die on the borders of the empire than enjoy the favours and the wealth which the barbarian monarch might bestow upon them. They returned to their country; and Chosroes, in a treaty which he at the time concluded with the Greek emperor, nobly stipulated that the seven philosophers who had visited his court should be exempt from the penal laws which Justinian enacted against his pagan subjects. Simplicius and his friends, after their return, lived in peace and retirement at Athens, where they devoted the remainder of their lives to the study of philosophy, enjoying the reputation of being wise and virtuous men.

Simplicius wrote Commentaries on Aristotle's Categories, Physics, De Coelo, and De Anima. One of his objects in these commentaries is to reconcile the Platonic and Stoic systems with the Peripatetic school, to which he himself belonged. They are the most valuable of all the extant Greek commentaries on Aristotle; for Simplicius possessed a profound knowledge of his author, as well as of other philosophical writers of antiquity; and as he frequently quotes the opinions of antient philosophers whose works are no longer extant, his commentaries are a fruitful source for those who wish to study the history of antient philosophy. His commentaries are printed in some of the early editions of Aristotle; they are also contained in 'Scholia in Aristotelem, collegit Ch. A. Brandis,' Berlin, 1836, &c.

Simplicius also wrote a Commentary on the Enchiridion of Epictetus, which for its pure and noble principles of morality has commanded the admiration of all ages. The best modern edition of this commentary is that by Schweighäuser, with a Latin translation, in 2 vols., Leipzig, 1800. It has been translated into English by Dr. G. Stanhope, London, 1704, 8vo.; into French by Dacier, Paris, 1715; and into German by Schulthess, Zürich, 1778.

SIMPLON. [Switzerland.]

SIMPSON, THOMAS, a distinguished English mathematician, was born at Market-Bosworth in Leicestershire, August 20, 1710. He appears even in his boyhood to have had a strong inclination for acquiring information by reading and conversation; but his father, who was a weaver, intending that he should follow that occupation, endeavoured to divert him from a pursuit which interfered with the labour of his hands. The impulse of genius however prevailed over the remonstrances of the parent, and the youth, having quitted his father's house, went to reside at Nuneaton, where, in the exercise of his trade, he obtained the means of subsisting, and during the intervals of leisure he indulged his taste for the acquisition of knowledge.

Young Simpson was led to the study of mathematics by having accidentally obtained possession of a copy of Cocker's 'Arithmetic,' to which was annexed a short treatise on algebra; and, similarly to what is related of Tycho Brahé, it is said that he applied himself to astronomy from admiration of the science in consequence of the occurrence (in 1724) of a great eclipse of the sun at the time, which had been predicted. It is added that an itinerant pedlar and fortune-teller instructed him at the same time in the mysteries of judicial astrology, and this art he occasionally practised during several years.

While yet a stripling he married a woman about fifty years of age, the widow of a tailor and the mother of two children, of whom the younger was his senior by two years: all the family however appear to have lived together in harmony, Simpson working at his trade by day, and increasing his income by keeping a private school in the evenings. In 1733 he went to reside at Derby, where he continued to follow the united avocations of weaver and schoolmaster, and where he found means to increase his knowledge of mathematics. With arithmetic, geometry, and algebra he was already acquainted; and now, having obtained a loan of Stone's translation of the Marquis de l'Hôpital's 'Analyse des Infiniment Petits,' he was enabled by the force of genius and unremitting application to make himself master of the direct and inverse method of fluxions. Being thus qualified, he began in or before the year 1735 to write answers to the mathematical questions in the 'Ladies' Diary,' and even to propose questions for solution in that work. Some of the questions have a certain degree of intricacy, and they afford evidence that, at this time, the scientific attainments of Simpson, considering his means, must have been very extensive.

In the year 1736 or 1735 Simpson came to London and took lodgings in Spitalfields, where at first he both worked at the loom and gave instruction, as he had done in the country; but his great abilities becoming known to the world, and being perhaps more conspicuous from the obscurity of his situation, he was enabled to give up his trade and devote himself wholly to science. Having brought his family to the metropolis, he established himself there as a teacher of the mathematics, and employed his leisure hours in extending his researches into the highest branches of the science.

On the death of Dr. Derham, Mr. Simpson was, in 1743, appointed professor of mathematics in the Royal Military Academy at Woolwich; and this post he held during nearly all the rest of his life. He is said to have been successful in acquiring the friendship and esteem of his pupils; and while exerting himself diligently in fulfilling his public duties, he found time to compose numerous works on the most abstruse points in the mathematical and physical sciences.

In 1746 he was admitted a fellow of the Royal Society, and on account of the mediocrity of his circumstances he was excused the payment of the admission fee and the annual subscriptions: several of his mathematical papers were printed in the 'Transactions,' but most of them were afterwards republished in the volumes of his works. In 1760, when the present bridge at Blackfriars was about to be built, Mr. Simpson was consulted with other mathematicians concerning the form which would be most advantageous for the arches; he appears in consequence to have taken some pains in investigating the conditions of the stability of vaults, and to have given the preference to those of a hemi-cylindrical form, but he did not live to complete the work, and the results of his researches have never been made public.

As Mr. Simpson advanced in life, he became gradually a prey to melancholy, which appears to have been increased by the influence of bad habits; his mental faculties were at length so far impaired that he became incapable of performing the duties of his professorship, and in the beginning of the year 1761 he was prevailed on to retire to his native town. The fatigues of the journey increased his disorder, and he died May 14, in that year, in the fifty-first year of his age.

Considering the circumstances attending Simpson's early life, and the laborious occupation in which he was afterwards engaged, it is not without surprise that we contemplate the number of works which he wrote, and the profound research those works display. His first publication, which came out in 1737, was entitled 'A New Treatise of Fluxions,' in which the direct and inverse methods, as they were called, are demonstrated with considerable precision and perspicuity, and agreeably to the manner of Newton; the work also contains several useful applications of the calculus to subjects in natural philosophy and astronomy. Thirteen years afterwards, that is, in 1750, he published 'The Doctrine and Applications of Fluxions,' which he dedicated to the earl of Macclesfield, and which, though it embraces the same subjects as form the body of the 'Treatise,' must, from the numerous improvements it contains, be considered as a separate work.

In 1740 Simpson published 'A Treatise on the Nature and Laws of Chance,' besides 'Essays on several subjects in pure and mixed Mathematics;' and two years afterwards 'The Doctrine of Annuities and Reversions,' with tables showing the values of single and joint lives. These works were followed, in 1743, by 'Mathematical Dissertations on Physical and Analytical Subjects,' among which will be found an investigation of the figure of a planet revolving on its axis, and of the force of attraction at the surfaces of bodies which are nearly spherical; also a theory of the tides and of astronomical refractions. These dissertations were dedicated to Martin Folkes, Esq., the president of the Royal Society.

'An Elementary Treatise on Algebra' was published in 1745; 'The Elements of Geometry,' in 1747; and in the next year 'A Tract on Plane and Spherical Trigonometry,' with the 'Theory of Logarithms.' With the elements of geometry are given notes in which are suggested improvements on some of the demonstrations of Euclid; but in making occasional observations on the notes given in the first edition of Dr. Robert Simson's 'Euclid,' for example on the note to the first proposition of the eleventh book, he has fallen into some slight inaccuracies which have been remarked on in the succeeding editions of the latter work. A second edition of Thomas Simpson's 'Geometry' was published in 1760.

In the year 1752 he published 'Select Exercises in Mathematics,' in which are given many geometrical and algebraical problems with their solutions, and a theory of gunnery; but his last and most valuable work was that which is entitled 'Miscellaneous Tracts' (1754). This consists of eight separate papers, four of which relate to pure mathematics, and the others to physical astronomy. The first paper contains investigations for determining the precession of the equinoxes and the nutations of the earth's axis; the second contains equations for correcting the place of a planet in its orbit on the hypotheses of Bullialdus and Seth Ward; and the third is on the manner of transferring the motion of a comet from a parabolical to an elliptical orbit. In the fourth paper are explained the advantages, in point of accuracy, which arise from using a mean of several astronomical observations instead of one single observation. The fifth contains the determination of certain fluents; the sixth, the resolution of algebraic equations by means of surd divisors; and the seventh, a general rule for the resolution of isoperimetrical propositions. The eighth paper contains the resolution of some important problems in astronomy; the propositions in the third and ninth sections of the first book of Newton's 'Principia' are demonstrated, and the general equations are applied to the determination of the lunar orbit.

In order that the merit of this last paper may be rightly appreciated, it is necessary to observe that about the year 1745 the modern analysis was first applied to the determination of the elements of the orbits of the earth, moon, and planets; these bodies being supposed to perturbate each other's motions by their mutual attractions, as well as to be subject to the general attraction of the sun. In the prosecution of the research, the mathematicians Clairaut, D'Alembert, and Euler particularly investigated the effect of the sun's attraction in causing a progression of the apogee of the moon's orbit, which progression, being a remarkable consequence of perturbation, was considered as a test of the correctness of the general principle and law of attraction which had been assumed by Newton. The first efforts of M. Clairaut showed an amount of progression in the period of a revolution of the moon about the earth, equal to about half only of that which had been determined from astronomical observations ('Mémoires de l'Académie,' 1747); and it is remarkable that both D'Alembert and Euler obtained at the same time a like erroneous result. This circumstance at first caused some doubts to be entertained of the truth of Newton's hypothesis, that the force of attraction varies inversely as the square of the distance: but the process employed by the three mathematicians being one of successive approximations only, it was afterwards discovered by Clairaut that, on continuing the process, the second step in the approximation produced a quantity nearly equal to that which had been obtained by the first step; and thus the computed progression was found to coincide with the results of observation. Now Simpson, employing a differential equation of motion like that which had been used by the foreign mathematicians, obtained the values of its terms by means of indeterminate coefficients; a method which entirely avoided the inaccuracy resulting from the species of approximation which they had adopted; and thus he arrived at once at the true value of the progression.

The 'Tracts' were not published till seven years after Clairaut's 'Mémoire' came out, and it appears that, in the interval, that mathematician during a visit to England had an interview with Simpson; the latter states however, in the preface to his 'Tracts,' that previously to having had any communication with M. Clairaut, he had discovered that the movement of the moon's apogee could be accounted for on the Newtonian law of gravitation. There is therefore no reason to doubt that Simpson had the merit of arriving at a determination which served to confirm the truth of that law by a process entirely his own: the whole investigation exhibits profound mathematical skill, and fully entitles him to the character of having been one of the ablest analysts, for all the purposes of practical science, of which the country can boast.

Mr. Simpson continued during the whole of his life his contributions to the 'Ladies' Diary,' of which work he was the editor from 1754 to 1760.

SIMSON, ROBERT, one of the many mathematicians who have given a lustre to the universities of Scotland, was a son of Mr. John Simson, of Kirton Hall in Ayrshire, and was born in October, 1687. About the year 1701 he was sent to the university of Glasgow, where he acquired that proficiency in the learned languages which he retained during all his life, and at the same time he made considerable progress in moral philosophy and theology, being destined by his father for the church. Young Simson soon however found a pursuit more congenial to his taste in the study of mathematics, and chiefly of the antient geometry: to this subject he applied himself at first as a relief from what he considered as a more laborious occupation, and it became at length almost the sole employment of his life.

In 1710 Mr. Simson made a visit to London, where he remained about a year, and where he became acquainted with Dr. Halley, Mr. Caswell, Dr. Jurin, and Mr. Ditton; from the conversation of the last gentleman, who was then mathematical master of Christ's Hospital, he gained, not as a pupil, but as a friend, a considerable accession to his knowledge of science.

On the resignation of Dr. Robert Sinclair, Mr. Simson was appointed, in 1711, to succeed him as professor of mathematics in the university of Glasgow. He then applied himself to the duties of his office, and regularly gave lectures on five days in each week during the session of seven months. This practice he continued for nearly fifty years; but in 1758, being then seventy-one years of age, he was obliged to employ an assistant, and three years afterwards the Rev. Dr. Williamson, who had been one of his pupils, was appointed his successor.

In 1735 Dr. Simson published in 4to. a 'Treatise on Conic

Sections,' and a second edition in 1750: in this work the investigations are conducted agreeably to the spirit of the antient geometry, and propositions are introduced expressly that it might serve as an introduction to the treatise of Apollonius on the same subject.

By the advice, it is said, of Dr. Halley, Simson early directed his attention to a restoration of the works of the Greek geometers, and his first effort was made on the porisms of Euclid: a branch of the antient analysis which is only known from the short account in the works of Pappus. In this difficult task however he succeeded, but his 'Tract' on the subject was not published till after his death. Having acquired a sort of key to that analysis, he undertook a restoration of the 'loci plani' of Apollonius, and this he completed about the year 1738. The work was first published in 1746, and Dr. Simson acquired by it the reputation of being one of the most elegant geometers of the age. Another subject on which the peculiar talents of Dr. Simson were exercised, was the 'sectio determinata' of Apollonius, and this also he was so fortunate as to restore. The work appears to have been commenced at an early period of his life, but it was only published, along with the Porisms, after his death.

A perfect edition of the principal part of Euclid's 'Elements' was the next object of Dr. Simson's labours. Numerous errors were known to exist in the Greek copies, and the correction of these was a task worthy of a scholar who had made the antient geometry almost exclusively his study. An edition of the 'Elements' and of the 'Data' was published in 4to. about 1758, and the work has always enjoyed a high character both for precision in the definitions and accuracy in the demonstrations. It is probable that the British mathematician has even corrected errors which existed in the original text, though his high regard for Euclid has led him to assume that all those which he has discovered have arisen from the negligence or unskilfulness of the antient editors or copyists. Having been very generally used for the purposes of elementary instruction, many editions of this work have since been published.

After his retirement Dr. Simson employed himself chiefly in correcting his mathematical writings; but though he had several works nearly fit for publication, he printed none except a new edition of Euclid's 'Data.' He was seriously ill only during a few weeks previously to his death, which took place October 1, 1768, in the eighty-first year of his age.

In 1776 Earl Stanhope published, at his own expense, and for private circulation, the above-mentioned restorations of Euclid's books of Porisms, and of the two books of Apollonius 'De Sectione Determinata:' together with these works the same nobleman published a tract on the limits of ratios and another on logarithms, both of which had also been written by Dr. Simson. An edition of the works of Pappus was found among the Doctor's MSS., and was sent by his executors to the University of Oxford.

Dr. Simson, though devoted to geometry, was well acquainted with the modern analysis, and the latter was occasionally the subject of his college lectures; it is however to be regretted that so much of his time was spent in the effort to restore the precise works of the antients, when it might have been more profitably employed in forming a connected system of their analysis, and in showing its application to the solution of problems relating to physical science. He was never married, and the greater part of his long life was spent within the walls of the college; his hours of study, his exercises, and even his amusements being regulated with great precision. In his disposition he was cheerful and sociable; and his conversation, which was animated, abounded with literary anecdote and good humour, though he was subject, when in company, to occasional fits of absence. He was a man of strict integrity and pure morals, and he appears to have had just impressions of religion, though he never allowed the subject to be introduced in mixed society.

SIN. One of the few passages of Scripture in which we have something which approaches to the character of a definition relates to this word: 'Sin is the transgression of the law.' (1 *John*, iii. 4.) Within this definition would be comprehended all actual sins, when the word law is interpreted to mean the Christian law, the rule by which the minds of all who profess Christianity are bound; and not merely open palpable offences against the law, such as murder, theft, lying, and the like, but sinful omissions of duty, and those sins which are only those of contemplation and thought: since the Christian rule commands us not to neglect the performance of our duties, and to keep a watch over the thoughts as well as over the actions and words.

It was this comprehensive and most excellent law which was in the mind of the Apostle when he said that 'sin was transgression of the law,' or at least that other divine law which bound the conscience of the Jews. But the expression may be taken to express more generally any law which a person holds in his conscience to be binding upon him, whether it be a law of nature only, or a law in which the natural perception of right and wrong is modified by and mixed with what is received as the will of God concerning us by direct revelation from him.

When the word sin is however applied to any act, it is always, among correct writers or speakers, used with reference, either expressed or implied, to religious obligation, and to the responsibility in which we stand to God, and the liability in which we are to future punishment. 'To do wrong' would express the same act as 'to commit sin;' but we use the former phrase without thinking of the offence which is done against God in any act of the kind; not so when we use the other phrase.

Under this definition it is evident that there may be degrees in sin: and we mention this to remove what we deem an erroneous opinion on this subject, which goes the length of saying that there is really no difference between the slightest violation of any moral obligation and the more heinous transgressions. The error on this point arises out of one of the commonest mistakes in respect of language—confounding words in their abstract with words in their concrete state. It is true that sin in the abstract is one and indivisible, and there are no degrees in it; it expresses that which is most offensive in the sight of a pure, holy, and judging God. But when we say 'a sin,' we then refer to some particular act; and common sense tells us that in all acts in which the law is transgressed there is not the same amount of moral turpitude, the same amount of defiance to the Divine Power, the same injury to society or to our neighbour, and consequently not the same amount of offence in the sight of God. At the same time it cannot be too strongly inculcated upon all to keep a watchful guard upon themselves lest they commit even the smaller offences; for nothing is more certain in the philosophy of mind, than that small offences lead imperceptibly to the toleration of greater, so that the man who thinks little of small offences may become, before he is aware, guilty of those of the most heinous nature.

There is also what divines call Original Sin; a phrase which is differently interpreted by different persons. By some it is considered as being the act of sin committed by our first parents when they transgressed the law which had bound them not to eat of the fruit of a certain tree; and this act of sin is regarded as partaken in by all the posterity of Adam, who were, as it were, existent in him their common father, and as fixing upon all the guilt of his sin, and exposing them to punishment which would be inflicted for this particular sin, to say nothing of their own sin, but for the great redemption. There are many modifications of this notion and many intermediate shades of opinion till we arrive at the view of original sin which represents the nature of man as changed by the transgression in this particular of our common ancestor; so that a nature previously perfectly innocent and free from the least tendency to sin, became changed into one in which the disposition to sin is inherent and the repugnance to the Divine will strong and universal. There are some classes of professing Christians who do not use the phrase original sin, though they admit the proneness of man to sin, attributing it to his ignorance and imperfection, to the violence of his appetites and passions, and in general referring it to that state of probation in which it seems to them to have been the intention of their Maker to place us.

SINAI, MOUNT. [ARABIA, p. 213.]

SINA'PIS, the name of a genus of plants belonging to the natural order Cruciferæ or Brassicaceæ. All the species are known by the name of mustard, a word derived from *mustum ardens*, in allusion to their hot and biting character. The genus is known by its siliquose fruit, which is rather terete with nerved valves; small, short, acute style; subglobose seeds disposed in one row in each cell, and spreading calyx. The leaves are of various forms, lyrate or deeply toothed. The flowers yellow, arranged on terminal bractless racemes. They are chiefly natives of the temperate parts of both hemispheres of the old world. Between 40 and 50 species of this genus are enumerated. Of these two species are well known and much cultivated in this country, *Sinapis nigra* and *S. alba*, the black and white mustard.

S. nigra, the black mustard, is known by its smooth, even, somewhat tetragonal siliques closely pressed to the peduncle; lyrate lower leaves, and lanceolate upper leaves. It is found in cultivated fields, waste grounds, and roadsides throughout Europe. The young plants of both black and white mustard are eaten as salad, and are both cultivated for this purpose. The black however differs from the white mustard in the flowers and seed being much smaller, and in the latter being black. But the great purpose for which the black mustard is grown is for the seeds, which when ripened and powdered form the well-known condiment mustard. 'To raise the seed for flour of mustard and other officinal occasions, sow either in March or April in an open compartment, or large sowings in fields, where designed for public supply. Sow moderately thick, either in drills six or twelve inches asunder; or broad-cast, after the ground has been properly ploughed and harrowed, and rake or harrow in the seed. When the plants are two or three inches high, hoe or thin them moderately where too thick, and clear them from weeds. They will soon run up to stalks, and in July, August, or September return a crop of seed ripe for gathering; being tied up in sheaves and left three or four days on the stubble.' (Don's Miller.) Rain damages the crop very much. Black mustard exhausts the soil rapidly. It is cultivated to a great extent in the county of Durham. When once grown it is difficult to extirpate on account of the great vitality of the seeds, which, if buried at almost any depth and for any length of time, will germinate when brought to the surface. In preparing the flour of mustard in this country, the black husk of the seed is separated by delicate sifting. This process, which is not gone through on the Continent, makes the British mustard of so much lighter and more agreeable colour. The mustard on the Continent however is stronger, as the greater proportion of the volatile oil on which the strength of the mustard depends resides in the testa, or husk of the seed, which in this country is thrown away.

S. alba, white mustard: siliques hispid, spreading, rather narrower than the ensiform beak; leaves lyrate, smoothish; stem smooth. It is a native of Britain and most countries in the south of Europe. It is frequently cultivated, and when young is eaten as a salad. Its seeds are white, and by expression yield a bland insipid oil perfectly free from acrimony, but leaving behind a cake more pungent than the seeds themselves. In the culture of this plant for salad the seed should be sown once a week or fortnight, in dry warm situations, in February and March, and in shady borders in the heat of summer. They are best sown in shallow flat drills, from three to six inches apart. The seeds should be put in thick and regular, and covered with not more than a quarter of an inch of mould. In winter or early spring it may be grown under a hand-glass, or in hotbeds and stoves.

SINAPIS. Two species of this genus are used in this country to yield the mustard of commerce, S. alba and S. nigra, or white mustard and black mustard. Both are annuals, the latter extensively cultivated in Yorkshire and Durham. Of the former the seeds are large, smooth, not veined or reticulated, and when bruised and mixed with water, do not evolve a pungent odour. The integument or skin is also thin, and the quantity of fixed oil obtained from it is less than from that of the black mustard. White mustard is of a light colour externally (but one variety is blackish), and when reduced to powder, is of a light yellow colour.

The seeds of black mustard are about the size of the head of a common pin, ovato-globose, of a reddish-brown, beautifully veined, internally yellow, oily, and yielding a yellowish-green powder. The chemical constitution of the two is essentially different, as it is only the black mustard which evolves, when bruised and mixed with water, the pungent principle which irritates the eyes, nostrils, and skin. The white mustard possesses a non-volatile principle, which is developed by the addition of water. It is the young plants from this species which are eaten with cress as a salad.

The chemical constitution of black mustard seems to be of the most complex kind. According to Dr. Pereira, it contains myronate of potash, myrosyne, fixed oil, a pearly fat matter, gummy matter, sugar, colouring matter, sinapisin, free acid, peculiar green matter, and some salts, chiefly sulphate and phosphate of lime. The volatile oil does not pre-exist in the mustard, but is formed, when water is added, 'by the mutual action of the contained myrosyne and myronate of potash (sinapisin?).' It may be obtained by distilling one part of the marc (*i.e.* the cake of bruised mustard-seeds which remains after the fixed oil has been expressed) with from five to eight parts of water. It is soluble in alcohol and æther, and also, what is very singular, in water, requiring however five hundred parts for its solution. Water in which it is dissolved is a powerful vesicant and rubefacient. It has been recommended as a counter-irritant in the same cases as sinapisms or mustard-poultices are employed. It possesses the advantage of extreme rapidity of action; and when used in cases of torpor or coma, if on the return of sensibility the patient complains of pain from the application, this can be immediately removed by washing the part with sulphuric æther, a property no other rubefacient agent possesses, and which entitles it to a preference in many cases. It is the only volatile oil of indigenous origin which is heavier than water, its specific gravity being 1·015 at 68° of Fahr. It possesses the same power as other volatile oils in preventing the development of fungi.

The fixed oil is perfectly bland, like that of olive or rape, which last it greatly resembles. It exists to the extent of 20 per cent. in white, and about 28 per cent. in black mustard-seed. To obtain it the seeds are crushed in a mill or between rollers, and the skins should be subjected to pressure as well as the farina or flour. The cake may then be sifted and reduced to a fine powder, as it retains all the pungent properties. In France the oil is generally left in the seeds, which renders them very difficult to powder, and makes it expensive. It is also less potent than English mustard in equivalent quantity. The marc or cake is sometimes used as manure, but this is a waste. The oil is valuable for burning, especially as it does not freeze, except at a temperature below zero. It also forms, with an alkali, a firm good soap. It has been supposed to be anthelmintic as well as purgative, but its medicinal properties are insignificant.

Flour of mustard, mixed with water, forms the well-known condiment so much used with all the more indigestible articles of food, the solution of which it seems to favour by rousing the powers of the stomach. A tablespoonful of mustard in a tumbler of water forms a ready and useful emetic in many cases of poisoning, especially when narcotic poisons have been taken. Added to foot-baths, mustard has a revulsive action, which is often serviceable in the commencement of colds, and when gout has seized the stomach or brain; also when cutaneous diseases have suddenly receded.

Sinapisms are generally directed to be made with vinegar, but water of the temperature of about 100° Fahr. is preferable, and less expensive. French mustard for the table is often prepared with vinegar. Some years ago, the seeds of white mustard, taken whole, in the dose of a tablespoonful, were recommended as a cure for many complaints. This was only an old practice revived, and not free from danger, as the seeds have been known to lodge in the intestines and cause death. See Cullen's 'Materia Medica,' vol. ii., p. 170. Respecting the mustard-plant of Scripture, see 'Trans. of Linnean Society of London,' vol. xvii., p. 449.

SINCAPORE. [Singapore.]

SINCLAIR, SIR JOHN, Bart., third son of G. Sinclair, Esq., heritable sheriff of Caithness, was born at Thurso castle, in the county of Caithness, in the year 1754.

He embraced the profession of the law, and was called to the English bar in 1782, having been admitted a member of the faculty of advocates in Scotland in the year 1775.

In 1780 he was chosen member for his native county, and sat in the house during several successive parliaments, sometimes for Caithness, sometimes for other places. He was created a baronet in 1786, and in 1810 was honoured with a seat at the board of privy council. He was likewise a member of several learned societies, and became extensively known by his writings, which, for more than fifty years, issued rapidly from the press. His death took place at Edinburgh, on December 21, 1835, in the 82nd year of his age.

Sir J. Sinclair did much for the improvement of his country. He established a very useful society in Scotland in 1791 for improving wool, and his exertions led to the formation of the Board of Agriculture in 1793, of which he was the first president. Among the most important of his numerous works may be mentioned his 'Statistical Account of Scotland;' 'History of the Revenue of Great Britain;' and 'Account of the Northern Districts of Scotland.' The first of these is an extraordinary work, and displays an almost incredible amount of labour and research.

SINDE. [Hyderabad.]

SINDIA, FAMILY OF. The origin of this celebrated family of Mahratta chiefs and princes is comparatively modern. The family were sudras, of the peaceful tribe of Koonbees, or cultivators. The first who distinguished himself as a soldier was

Ranojee Sindia, who was originally a potail, or head man of a village. The Paishwa Bajerow, who succeeded his father Biswanath Row in 1720, appointed Ranojee to the humble office of bearer of his slippers. A circumstance which seemed to show his fidelity and attachment to his master, is said to have led to his promotion. Bajerow one day found him asleep on his back, with the slippers firmly clasped to his breast, and was so much pleased as to appoint him immediately to a station in his body-guard. Ranojee Sindia was active and enterprising, and he was rapidly promoted. In 1734 he had risen to the highest rank of Mahratta chiefs; for when Bajerow came into Malwa in that year, Ranojee signed a bond which was required by the emperor of Delhi, Mahomed Shah, as a surety for the good conduct of his master the Paishwa. Before Ranojee died he had obtained the hereditary government of one-half of the extensive province of Malwa. By his wife, who belonged to his own tribe, he had three sons, Jeypah, Duttajee, and Jotabah; and by a Rajpoot woman he had two sons, Tukajee and Madhajee, of whom

Madhajee Sindia became the head of the family. The date of his birth is uncertain; it was probably about 1743; he was present at the battle of Paniput in 1761, when the Mahrattas were defeated by Ahmed Shah Abdallah and his Afghans, in union with the Rajpoot and Mohammedan princes of northern Hindustan. In this disastrous battle one-half of the Mahratta army, which amounted to 200,000 men, are said to have been slain. Madhajee Sindia was pursued by an Afghan horseman for many miles, who at length overtook him, and left him for dead in a ditch, after having wounded him with his battle-axe in the knee in such a manner as to render him lame for life. The Sindia family, as well as the other Mahratta chiefs, were for a time deprived of all their possessions in Malwa and Hindustan proper; but this was not of long continuance. The Paishwa Bajerow died in 1761, and was succeeded by his son Madhoo Row, under whom, on the death of Mulhar Row Holkar in 1766, Madhajee Sindia became the most powerful of the Mahratta chiefs. Besides being the principal leader of the household-horse of the Paishwa, he had a large army of his own; and the return of Ahmed Shah to Cabul, and the contests among the Mohammedan princes under the weak emperor Shah Alum II., in a few years afforded opportunity to him and his brother Tukajee Sindia to recover their former hereditary government and possessions in Malwa and northern Hindustan.

In 1770, on the invitation of Nujeeb ud Dowlah, who was the minister of Shah Alum, Madhajee Sindia, Ramajee Row, and Tukajee Holkar entered Hindustan proper with their armies, for the purpose of expelling the Sikhs, who had invaded the emperor's territories. This was soon accomplished; and on the death of Nujeeb ud Dowlah in 1771, Madhajee Sindia obtained possession of Delhi, whither he induced Shah Alum to return from Allahabad, where he had been living under the protection of the British since 1765. In December the same year the emperor was crowned with great pomp in his capital. He was not however the less in subjection. Madhajee compelled him to sign a commission in which he appointed the Paishwa vicegerent of the empire; and the Paishwa, by a like commission, appointed Madhajee his deputy.

In 1772, and again in 1773, with his two colleagues Ramajee and Holkar, Sindia invaded and ravaged Rohilcund, and was preparing to cross the Ganges, when the murder of the young Paishwa Narrain Row, the usurpation of his office by his uncle Ragoba, and the appearance of the British and the nabob of Oude, who had been invited to assist the Rohillas, caused him to return to Poona. A confederacy of Mahratta chiefs was got up against Ragoba, who, after a reign of a few months, was compelled to fly. Sevajee Madhoo, the posthumous son of Narrain Row, was appointed Paishwa, and Ballajee Pundit, better known as Nana Furnavees, was elected dewan, or minister. The British, on the condition of his ceding to them certain territories, came to the assistance of Ragoba, which occasioned a war between them and the Mahrattas. This war, twice interrupted by treaties which were not completed, continued till 1782, when the treaty of Salbhye was concluded, by which Madhajee Sindia was confirmed in all his possessions, the places taken from him by the British were restored, and he was recognised by them as an independent prince.

Madhajee Sindia had now time and opportunity to prosecute his plans of aggrandisement. In 1785 he again appeared at Delhi, and by the murder of two of the imperial ministers once more put the emperor into his power; he also conquered Agra and Alyghur, and obtained possession of nearly the whole of the Doab. About this time he engaged in his service a Frenchman, De Boigne, who became of the most essential service to him; for by his assistance he formed an army consisting of troops regularly disciplined; he fought pitched battles, besieged fortresses previously deemed impregnable, gradually subjected raja after raja to contribution, and added district after district to his possessions, till he became master of nearly all the territory south-west from the banks of the Ganges to the Nerbudda. The battle of Meerta, gained by De Boigne in 1790 over the collected forces of Joudpoor, had made Sindia master of that principality, as well as of the weaker state of Odeypoor; to these conquests was added soon after that of Jypoor, which was followed in 1792 by the defeat of the troops of Tukajee Holkar, when four corps of regular infantry belonging to Holkar's army, which were commanded by a French officer, were almost utterly destroyed. Sindia himself had returned to Poona in 1791, where he died in 1794.

Madhajee Sindia's life was one of incessant activity; he was engaged in a series of contests in which he displayed great talent and untiring energy, and by which his power and possessions were gradually extended, consolidated, and confirmed. His habits throughout the whole of his career were those of a plain soldier; he was never seduced by luxury, and he despised the trappings of state. Though occasionally guilty of violence and oppression, his life was for the most part unstained by cruelty; his disposition was mild, and he was desirous of improving the countries which he conquered. Towards the British and those states which were unconnected with the Mahratta government he conducted himself as an independent prince, but in matters relating to the Paishwa he paid the most scrupulous attention to all the forms of humility, of which he made a curious display when Sevajee Madhoo Row, at the termination of his minority in 1791, entered upon the duties of his office, and Sindia came to Poona to pay his respects to him. Sir John Malcolm thus relates it: 'The actual sovereign of Hindustan from the Sutlege to Agra, the conqueror of the princes of Rajpootana, the commander of an army composed of sixteen battalions of regular infantry, 500 pieces of cannon, and 100,000 horse, the possessor of two thirds of Malwa, and some of the finest provinces in the Deckan, when he went to pay his respects to a youth who then held the office of Paishwa, dismounted from his elephant at the gates of Poona; placed himself in the great hall of audience below all the mankarries, or hereditary nobles of the state, and when the Paishwa came into the room, and desired him to be seated with others, he objected on the ground of being unworthy of the honour, and, untying a bundle that he carried under his arm, produced a pair of slippers, which he placed before Madhoo Row, saying, "This is my occupation; it was that of my father." Madhajee, at the moment he said this, took the old slippers the Paishwa had in use, which he wrapped up carefully, and continued to hold them under his arm; after which, though with apparent reluctance, he allowed himself to be prevailed upon to sit down. It has been supposed that by this affected humility he aimed at obtaining the situation of dewan to the Paishwa; if such however was his object, he was frustrated in it, for Nana Furnavese still retained it.

Madhajee Sindia had no sons. His brother Tukajee had three, of whom the youngest, Anund Row, became the favourite of his uncle, who adopted Dowlut Row Sindia, the son of Anund Row, as his heir.

Dowlut Row Sindia, at the death of his grand-uncle, was only thirteen years of age. He was opposed by the widows of Madhajee, who set up another prince in opposition to him, and he was not established in his power till after several battles had been fought. He married, soon after his accession, the daughter of Sirjee Row Gatkia, an artful and wicked man, who became his minister, to whom is doubtless to be ascribed much of the rapacity and cruelty which marked the early part of Dowlut Row's reign. The seizure and imprisonment of Nana Furnavese, the murder of several Brahmins, the plundering of Poona and the neighbouring places under pretence of paying the expenses of his marriage; and the aiding of Casee Row Holkar in the murder of his brother Mulhar Row, are among his early atrocities; in addition to which it should be mentioned, that when Sirjee Row Gatkia defeated Jeswunt Row Holkar in 1801, he plundered the city of Indore, set fire to the best houses, and murdered many of the inhabitants; in 1802 however Holkar defeated Sindia, and re-established himself in Malwa. But the interference of the British at length put a stop to this career of spoliation and bloodshed. The Paishwa Bajerow, having been defeated by Jeswunt Row Holkar in 1802, fled to Bassein, and placed himself under the protection of the British, by a treaty, the chief conditions of which were, that he should cede to them the island of Salsette, and they should restore him to the office of Paishwa. After many fruitless negociations with Sindia and the Raja of Berar, the British resident left the court of Sindia, August 3, 1803, and war was commenced on the 8th by an attack on the fortress of Ahmednugghur by Major-General Wellesley, which he soon took, and followed up on the 25th of September, 1803, by the battle of Assaye, when he gained a complete victory over the confederated forces of Sindia and the Raja of Berar, which were under the command of the French general Péron, and greatly more numerous than his own. In Hindustan Proper, General Lake, on the 29th of August, 1803, defeated Sindia's forces in the Doab, took the strong fort of Alyghur, and afterwards the cities of Delhi and Agra. In the short period of five months was included a series of the most brilliant and decisive victories; the battles of Delhi and Laswaree, of Assaye and Arghaum, the reduction of the strong forts of Ahmednugghur, Alyghur, Agra, Gwalior, Asserghur, and Cuttack, besides a number of inferior conquests. The two Mahratta chiefs were compelled to sue for peace separately. Sindia's brigades, which had been trained under De Boigne and Péron, and which amounted to at least 40,000 well-disciplined infantry, were destroyed; 500 guns, cast in the foundries which Madhajee had established, were taken; and by the treaty of December, 1803, he was compelled to cede to the British the Upper Doab, Delhi, Agra, Saharunpoor, Meerut, Alyghur, Etawah, Cuttack, Balasore, the fort and territory of Baroach, &c., amounting altogether to more than 50,000 square miles. By a treaty of defensive alliance, February 27, 1804, he engaged to receive a British auxiliary force in those dominions which he was suffered to retain, which were still large, and which were considerably increased, after the subjugation of Holkar, by the territory of Gohud and the strong fort of Gwalior, which were given up to him by the treaty of Muttra, November 23, 1805, one of the conditions of which treaty was, that his father-in-law Sirjee Row Gatkia should be for ever excluded from his councils.

Dowlut Row Sindia, though he retained for a considerable time no friendly feeling towards his British alllies, by whom he had been so severely humbled, never again ventured into a direct contest with them; and after he was freed from the influence of his father-in-law, he became by degrees better disposed towards them; so that in the war of 1818, by which the Mahratta power was entirely destroyed, he prudently kept aloof, though the Paishwa urgently called upon him for his assistance. The consequence was that he retained his territories, and continued on friendly terms with the British till his death, which took place March 21, 1827. He left an army of about 14,000 infantry, 10,000 cavalry, and 250 pieces of ordnance, with territories worth about 1,250,000*l*. per annum.

Janko Row Sindia, the present Raja of Gwalior, was elected by the widow of Dowlut Row, Baiza Bai. She was expelled from his territories in 1833 by Janko Row, who is now (1841) about 19 years of age.

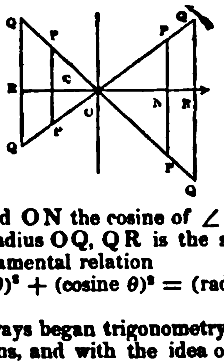
SINE and COSINE. We separate from the article Trigonometry the mere description and properties of these fundamental terms, which, though originally derived from simple trigonometry, are now among the most useful foundations of mathematical expression. For what we have to say on their history, we refer to the article just cited.

According to the antient system of trigonometry, the sine and cosine are only names given to the abscissa and ordinate of a point, not with reference to the position of that point in space, but to the radius vector of that point and its angle. Thus, measuring angles from the line ON, and in the direction of the arrow, the angle NOP has an infinite number of sines and cosines. With reference to the *radius* OP,



PN is the sine and ON the cosine of ∠NOP; but with reference to the radius OQ, QR is the sine and OR the cosine. The fundamental relation

$$(\text{sine } \theta)^2 + (\text{cosine } \theta)^2 = (\text{radius})^2$$

is obvious enough.

The student always began trigonometry with this multiplicity of definitions, and with the idea of some particular radius being necessary to the complete definition of the sine and cosine. But as he proceeded, he was always taught to suppose the radius a unit; that is, always to adopt that line as a radius which was agreed upon to be represented by 1. Hence he gradually learned to forget his first definition; and, passing from geometry to arithmetic, to use the following: PO being unity, the sine of NOP is PN, which is therefore in arithmetic the fraction which PN is of PO; and the cosine is the fraction which ON is of PO. If QO had been used as a unit, the result would have been the same; for by similar triangles, RQ is the same fraction of QO which NP is of PO.

In the most modern trigonometry, and for cogent reasons, the student is never for a moment allowed to imagine that the sine and cosine are in any manner representatives of lines. In a practical point of view, the final definition of the old trigonometry coincides exactly with that of the new; but the latter has this advantage, that all subsequent geometrical formulæ are seen to be homogeneous in a much more distinct manner. The definition is this: The sine of NOP is not NP, nor any number to represent NP; it is the fraction which NP is of PO, considered as an abstract number. Thus if ON, NP, PO, be in the proportion of 3, 4, and 5, PN is $\frac{4}{5}$ of OP: this $\frac{4}{5}$ is the sine of NOP, not $\frac{4}{5}$ of any line, nor any line considered as $\frac{4}{5}$ of a unit; but simply $\frac{4}{5}$, four-fifths of an abstract unit. Similarly the cosine is the fraction which ON is of OP. In just the same manner the abstract number π, or 3·14159…, is not styled (as it used to be) the circumference of a circle whose diameter is a unit, but the proportion of the circumference to the diameter, the number of times which *any* circumference contains its diameter. We cannot too strongly recommend the universal adoption of this change of style, a slight matter with reference to mere calculation of results, but one of considerable importance to a correct understanding of the meaning of formulæ.

The line OP being considered as positive [Sign], the signs of PN and NO determine those of the sine and cosine; and the manner in which the values of these functions are determined when the angle is nothing, or one, two, or three right angles, is easy enough. The following short table embraces all the results of sign:—

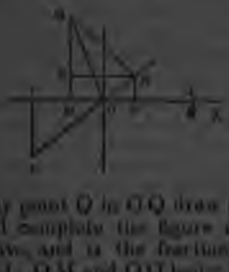
	O		I		II		III		IV
Sine	0	+	1	+	0	−	1	−	0
Cosine	1	+	0	−	1	−	0	+	1.

Read this as follows:—When the angle $=0$, the sine $=0$; from thence to a right angle the sine is positive: at the right angle the sine is $+1$; from thence to two right angles the sine is positive, &c.

The fundamental theorems of the sine and cosine, from which all their properties may be derived, are,

$$\sin(a+b) = \sin a \cos b + \cos a \sin b$$
$$\sin(a-b) = \sin a \cos b - \cos a \sin b$$
$$\cos(a+b) = \cos a \cos b - \sin a \sin b$$
$$\cos(a-b) = \cos a \cos b + \sin a \sin b.$$

all which theorems are in fact contained in any one of them, as soon as that one is shewn to be universally true. It frequently happens however that the student is allowed to assume the universal truth of these theorems upon the slight foundation of particular proof; drawing a figure for instance in which both angles are less than a right angle. We give, as an instance, the proof of the first formula when both angles are greater than two right angles. Let XOP $=a$, POQ $=b$, both angles being measured in the direction of revolution indicated by the arrow. The sum is four right angles + XOQ, which has the same sine and cosine as



XOQ. From any point Q in OQ draw perpendiculars on OX and OP, and complete the figure as shown. Then $\sin(a+b)$ is positive, and is the fraction which QM is of QO, or QM : QO, QM and QO being expressed in numbers. But

$$\frac{QM}{QO}=\frac{QS}{QO}+\frac{NR}{QO}=\frac{QS}{QN}\,\frac{QN}{QO}+\frac{NR}{NO}\,\frac{NO}{QO}$$

$$\text{By similar triangles }=\frac{OT}{PO}\,\frac{QN}{QO}+\frac{PT}{PO}\,\frac{NO}{QO}.$$

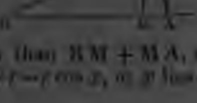
Now, remembering the magnitudes of a and b, and the use of signs established, we have

$$\sin a=-\frac{PT}{PO},\ \cos a=-\frac{OT}{PO},\ \sin b=-\frac{QN}{QO},$$

$$\cos b=-\frac{NO}{QO};$$

and substitution immediately gives the first formula. We shall not here dwell on the minor consequences of these formulae, but shall refer to the collection in TRIGONOMETRY.

The connexion of the sine and angle depends in great part upon the following theorem:—if x may be made as small as we please, $\sin x : x$ may be made as near to unity as we please. Observe that this theorem supposes the angle x to be measured by the theoretical unit [ANGLE], or the angle 1 to be the angle of which the arc and radius are equal. The proof depends upon the assumption that in the adjoining figure the arc AB is less than its containing contour AC + CB. If the radius OB be r, we see that x must be the AB : r, or AB $= rx$. Also BM $= r \sin x$, BC = AM $= r - r\cos x$, by definition. Now the arc AB is greater



than BM, and less than BM + MA, or rx lies between $r\sin x$ and $r\sin x + r - r\cos x$, or x lies between $\sin x$ and $\sin x + 1 - \cos x$,

$$\text{or between } \sin x \text{ and } \sin x+\frac{\sin^2 x}{1+\cos x};$$

$$\text{whence } \frac{x}{\sin x} \text{ lies between 1 and } 1+\frac{\sin x}{1+\cos x}.$$

Hence, x diminishing without limit, the difference between 1 and $x : \sin x$ diminishes without limit, and therefore that between 1 and $\sin x : x$; which was to be proved. From hence it follows that $1-\cos x$ and $\frac{1}{2}x^2$ approach to a ratio of equality, as may be readily proved from the equation

$$1-\cos x=\frac{x^2}{2}\left(\frac{\sin x}{x}\right)^2\frac{2}{1+\cos x}$$

in which the second and third factors have unity for their limit. Hence then, when x is very small, x and $1-\frac{1}{2}x^2$ are very near representatives of the sine and cosine; and the goodness of the representation may be increased to any extent by diminishing x.

The complete theory of the sine and cosine, from and after the two theorems just established, depends upon the introduction of the square root of the negative quantity. If we take ordinary algebra only [as in NEGATIVE, &c. QUANTITIES, p. 134, col. 2] in which the impossible quantity is unexplained, we have the most common mode of proceeding. The explanations afterwards given would make this theory the most simple imaginable, to a student who had learned algebra from the beginning in the manner pointed out. To take the middle course, let us assume the rules of algebra [OPERATION] independently of the meanings of the symbols. Let $\sin x$ and $\cos x$ be defined as 'such functions of x that $\sin(x+y)$ gives $\sin x . \cos y + \cos x . \sin y$, and $\cos(x+y)=\cos x . \cos y-\sin x . \sin y$.' Observe that we do not in thus defining say there are such functions; we only say, *if there be* such, let them have these names. Then, as in NEGATIVE &c. cited above, we see that if $\phi x = \cos x+\sqrt{-1} . \sin x$, the relation $\phi(x+y)=\phi x\times\phi y$ follows: whence [BINOMIAL THEOREM] ϕx can be nothing but K^x, where K is independent of x. Let $x=1$, whence $\phi(1)=K$, or we have

$$\cos x+\sqrt{-1} . \sin x=(\cos 1+\sqrt{-1} . \sin 1)^x \ldots (1)$$

and similarly it is shewn that

$$\cos x-\sqrt{-1} . \sin x=(\cos 1-\sqrt{-1} . \sin 1)^x \ldots (2).$$

From these we get, by multiplication,

$$\cos^2 x+\sin^2 x=(\cos^2 1+\sin^2 1)^x \ (3)$$

if it be possible, let $\cos^2 1+\sin^2 1=1$, then $\cos^2 x+\sin^2 x$ is always $=1$, or at least [ROOT] we may always take one pair of forms satisfying this condition. Hence, making $\cos 1+\sqrt{-1} . \sin 1=\epsilon$, we have $\cos 1-\sqrt{-1} . \sin 1=\epsilon^{-1}$, and the two equations give

$$\cos x=\frac{\epsilon^x+\epsilon^{-x}}{2},\ \sin x=\frac{\epsilon^x-\epsilon^{-x}}{2\sqrt{-1}}\ (4)$$

which will be found to satisfy all the conditions used in defining them, namely,

$$\frac{\epsilon^{x+y}+\epsilon^{-x-y}}{2}=\frac{\epsilon^x+\epsilon^{-x}}{2}\,\frac{\epsilon^y+\epsilon^{-y}}{2}-\frac{\epsilon^x-\epsilon^{-x}}{2\sqrt{-1}}\,\frac{\epsilon^y-\epsilon^{-y}}{2\sqrt{-1}}$$

$$\frac{\epsilon^{x+y}-\epsilon^{-x-y}}{2\sqrt{-1}}=\frac{\epsilon^x-\epsilon^{-x}}{2\sqrt{-1}}\,\frac{\epsilon^y+\epsilon^{-y}}{2}+\frac{\epsilon^x+\epsilon^{-x}}{2}\,\frac{\epsilon^y-\epsilon^{-y}}{2\sqrt{-1}}$$

$$\left(\frac{\epsilon^x+\epsilon^{-x}}{2}\right)^2+\left(\frac{\epsilon^x-\epsilon^{-x}}{2\sqrt{-1}}\right)^2=1$$

To determine what algebraical formula ϵ must be, take the universal formula

$$\epsilon^x=1+\log\epsilon . x+(\log\epsilon)^2\frac{x^2}{2}+(\log\epsilon)^3\frac{x^3}{2.3}+\ldots$$

whence we easily get from (4)

$$\sin x=\frac{\log\epsilon}{\sqrt{-1}}\,x+\frac{(\log\epsilon)^3}{\sqrt{-1}}\,\frac{x^3}{2.3}+\frac{(\log\epsilon)^5}{\sqrt{-1}}\,\frac{x^5}{2.3.4.5}+\ldots$$

$$\cos x=\quad 1+(\log\epsilon)^2\frac{x^2}{2}+(\log\epsilon)^4\frac{x^4}{2.3.4}+\ldots$$

Now ϵ, as far as our definitions have yet extended, is wholly undetermined, every value of ϵ being applicable. Let us add to our conditions that $\sin x : x$ shall approach to unity as x is diminished without limit: but $\sin x : x$ approaches to $\log\epsilon : \sqrt{-1}$; therefore $\log\epsilon=\sqrt{-1}$, or $\epsilon=e^{\sqrt{-1}}$.

The preceding is purely symbolical; we merely ask how are previous symbols, used under certain laws, to be put together so as to represent certain new symbols which are to have certain properties. Let us now take the real geometrical meaning of $\sin x$ and $\cos x$, and the complete system of algebra, in which $\sqrt{-1}$ is explained [NEGATIVE, &c. QUANTITIES]. In that system, if a line equal to the unit-line be inclined to it at an angle x, it is obviously represented by $\cos x+\sqrt{-1} . \sin x$, and any power of it, whole or fractional, can be obtained by changing x into mx, so that

$$\cos mx+\sqrt{-1} . \sin mx=(\cos x+\sqrt{-1} . \sin x)^m$$

is an immediate consequence of definition; and making $x=1$, the equation

$$\cos m+\sqrt{-1} . \sin m=(\cos 1+\sqrt{-1} . \sin 1)^m$$

follows at once. To prove that $e^{\sqrt{-1}}$ and $\cos 1+\sqrt{-1} . \sin 1$ are identical, in the most logical manner, requires a previous definition of an exponential quantity, in a sense so general, that exponents of the form $a+b\sqrt{-1}$ shall be included: without this, the new algebra just referred to is not free from the results of INTERPRETATION.

However we may proceed, the series above given for the sine and cosine of x become

$$\sin x = x - \frac{x^3}{2.3} + \frac{x^5}{2.3.4.5} - \frac{x^7}{2.3.4.5.6.7} + \ldots$$

$$\cos x = 1 - \frac{x^2}{2} + \frac{x^4}{2.3.4} - \frac{x^6}{2.3.4.5.6} + \ldots$$

and these series are always convergent. Their present form depends entirely on the unit chosen; if however by x we mean x°, x', or x'', we must write

$$\sin x = ax - \frac{a^3\,x^3}{2.3} + \frac{a^5\,x^5}{2.3.4.5} - \ldots.$$

$$\cos x = 1 - \frac{a^2\,x^2}{2} + \frac{a^4\,x^4}{2.3.4} - \ldots.$$

where [ANGLE, p. 23] a is ·01745,32925...., ·00029,08882,...., ·00000,48481,.... according as x means a number of degrees, of minutes, or of seconds.

The preceding is enough on the fundamental meanings of these terms, and on their connection with algebra. Some applications will be seen in TRIGONOMETRY.

SINE and COSINE, CURVES OF. By the curve of sines is meant that which has the equation $y = \sin x$, and by the curve of cosines, that which has the equation $y = \cos x$: it being understood that x stands for as many angular units as there are linear units in the abscissa. The undulatory forms of these curves are easily established· and if the ordinate of a curve consist of several of them, as in $y = a \sin x + b \cos x + c \sin 2x$, the several parts of the compound ordinate may be put together in the same manner as that in which the simple undulations are compounded in ACOUSTICS, p. 92. Except as expressing the most simple form of undulating curves, these equations are of no particular use in geometry.

SINE-CURE. Sine-cures are ecclesiastical benefices without cure of souls, and are of three sorts:—1. Where the benefice is a donative [BENEFICE, p. 220], and is committed to the incumbent by the patron expressly without cure of souls, the cure either not existing or being entrusted to a vicar; this is the strictest sine-cure. 2. Certain cathedral offices, viz. the canonries and prebends, and, according to some authorities, the deanery. 3. Where a parish is destitute, by some accident, of parishioners; this last kind has been called depopulations, rather than sine-cures.

Rectors of a parish in which vicars were likewise established with cure of souls have often by degrees exempted themselves from their ecclesiastical functions, and so have obtained sine-cures; but this is rather by abuse than legitimately.

Sine-cures are exempt from the statute of pluralities. (Burn's *Ecclesiastical Law.*)

SINEW. [TENDON.]

SINGAPORE is a British settlement in the East Indies, situated at the most southern extremity of the Malay Peninsula. It consists of the island of Singapore, and about fifty islets dispersed in the sea south and east of the principal island, or in what is called the Straits of Singapore. The territories of this settlement embrace a circumference of about a hundred miles, including the seas and straits within ten miles of the coast of the island of Singapore, and they lie between 1° 8′ and 1° 32′ N. lat., and between 103° 30′ and 104° 10′ E. long.

The island of Singapore occupies about half the space between the two capes with which the Malay Peninsula terminates on the south, Capes Buru and Ramúnia (commonly called Romania). It has an elliptical form, and is about 25 miles in its greatest length from east to west, and 15 in its greatest width. It contains an estimated area of about 275 square miles, and is about one-third larger than the Isle of Wight. It is divided from the continent of Asia by a long and narrow strait called Salat Tabrao, or the old strait of Singapore. This strait is nearly forty miles long, and varies in width between two miles and a quarter of a mile. At its western extremity, near the island of Marambong, it has only a depth of 2½ fathoms, but farther east it is nowhere more than five fathoms deep. This strait was formerly navigated by vessels bound for the China Seas; but the advantages which the Straits of Singapore offer for a speedy and safe navigation are so great, that the Salat Tabrao has not been used since the Straits of Singapore have become known. The last-mentioned strait extends along the southern coast of the island of Singapore, and the most navigable part lies within the British possessions. It is the high road between the eastern and western portions of maritime Asia.

The surface of the island is gently undulating, here and there rising into low rounded hills of inconsiderable elevation. The higher ground rises in general not more than a hundred feet above the sea; the highest hill, called Bukit Tima, which is north-west of the town, but nearer the northern than the southern shores of the island, does not attain 200 feet. The shores of the island are mostly low, and surrounded by mangrove-trees. In a few isolated places low rocks approach the sea, chiefly along the Salat Tabrao. In several places however the coast is indented by salt creeks, which sometimes penetrate into the land three and even five or six miles. When the island was first occupied by the British it was entirely, and is still for the greater part, covered with a forest composed of different kinds of trees, five or six of which are well adapted for every object of house-building. The soil of the interior is composed of sand and of clay iron-stone, mixed up with a large portion of vegetable matter, which gives it a very black appearance. There is a general tendency to the formation of swamps. Rivulets are numerous, but they are of inconsiderable size. Their waters are almost always of a black colour, disagreeable taste, and peculiar odour, properties which they appear to derive from the peculiar nature of the superficial soil over which they pass, which in many parts resembles peat-moss. The water however drawn from wells which are sunk lower than the sandy base is less sensibly marked by these disagreeable qualities.

The climate of Singapore is hot, but equable, the seasons varying very little. The atmosphere throughout the year is serene. The smooth expanse of the sea is scarcely ruffled by a wind. The destructive typhons of the China Sea, and the scarely less furious tempests which occur on the coasts of Hindustan, are not known. The tempests of the China Sea however sometimes occasion a considerable swell in the sea, and a similar but less remarkable effect is produced by a tempest in the Bay of Bengal. It is only in this way, and as it were by propagation, that the sea is affected by remote tempests, and their effects are particularly remarkable in the irregularity of the tides, which at times run in one direction for several days successively, and with great rapidity. In the numerous narrow channels which divide the smaller islands, their rapidity is sometimes so great that it resembles water issuing through a sluice. The regular and periodical influence of the monsoons is slightly felt, the winds partaking more of the nature of land and sea breezes. To these circumstances must be attributed the great uniformity of the temperature, the absence of a proper continual and periodical rainy season, and the more frequent fall of showers. Few days elapse without the occurrence of rain. According to an average of four years, the number of rainy days was 185, and that of dry only 180. The greatest quantity of rain falls in December and January, and the smallest in April and May. These frequent rains keep the island in a state of perpetual verdure.

The thermometer ranges during the year between 72° and 88°. The mean annual temperature is 80·7° of Fahrenheit. In the four months succeeding February it rises to 82·50°, and in the four months succeeding October it sinks to 79°. The daily range of the thermometer never exceeds ten degrees. Crawfurd states that the climate of Singapore is remarkably healthy, which he attributes to the free ventilation that prevails, and to the almost entire absence of chilling land-winds, but Newbold thinks that it is not so healthy as Malacca, and he ascribes this to the less regular alternations of the land and sea breezes.

Singapore is not rich in agricultural productions. No part of it was cultivated when the British took possession of the place, and at first the soil was considered ill adapted for agricultural purposes. But it now appears that considerable tracts near the town have been cleared by the Chinese, and that this industrious people have succeeded in cultivating different kinds of fruits and vegetables, rice, coffee, sugar, cotton, and especially pepper and the betel-vine (*Piper siriboa*). Only the summits of the higher grounds are barren, but on their slopes and in the depressions between them the soil frequently has a considerable degree of fertility. Tropical fruits succeed very well, such as the mangusteen, pine-apple, cocoa-nut, orange, and mango. The mango is found wild in the forests. The tropical vegetables, as the egg-plant, different kinds of pulse, the yam, the batata, different varieties of cucumber, and some others, grow very well, but the climate is too hot for most European vegetables. The produce of the paddy-fields, as well as of the orchards, is far from being sufficient for home consumption, and accordingly large quantities of rice are imported from Sumatra and Java, and fruits from Malacca.

The animals of Europe have been introduced, but most of them are few in number, as pasture-grounds are scarce. The Chinese however keep a great number of hogs. None of the large quadrupeds of the continent of Asia, such as elephants, rhinoceroses, tigers, and leopards are met with on the island, but there are several kinds of monkeys, bats, and squirrels; also the [illegible], the porcupine, the sloth (*Bradypus didactylus*), the pangolin, the wild hog, and two species of deer, the *Moschus pygmaeus*, which is smaller than an English hare, and the Indian roe (*Cervus muntjac*). Sometimes the dugong (*Halicore dugong*) is taken in the straits. It is ten or twelve feet long, and the flesh is considered for flavour and delicacy not inferior to beef; the skin is as strong as that of the hippopotamus. Birds are numerous, especially different kinds of passeres, climbers, and waders, particularly the first, which are remarkable for their novelty and beauty. Tortoises are common. The coral reefs and islands in the vicinity of Singapore furnish that delicate moss-like seaweed called agar-agar (*Fucus Saccharinus*) in abundance, and it forms an article of considerable export to China, where it is used in thin glues and varnishes. It is made into a very fine jelly by Europeans and the native Portuguese. The average annual produce is 2000 peculs, or 2380 cwt., and it is sold at three dollars the pecul.

In 1819, when the British took possession of the island, the population amounted to about 150 individuals, mostly fishermen and pirates, who lived in a few miserable huts; about thirty of these were Chinese, the remainder Malays. The first census was taken in 1824, and then the population amounted to 10,683 individuals. Since that period it has constantly been increasing, and at the census of 1836 it was found to amount to 29,984 individuals. More than half of the population were settled in the town of Singapore, which contained 16,148 individuals, of whom there were 12,748 males and 3400 females. West of the town only a few settlements occur along the southern shores of the island, and on some of the small islands near the coast. These settlements constitute the district of Singapore town, and contained in 1836 only 4183 individuals, viz. 2336 Chinese, of whom forty-one only were females, and 1733 Malays, of whom 759 were females; and the remainder, with a trifling exception, Klings and Bugis. The country east of the town, which is named the District of Kampong Glam, contains a greater number of settlements, and they extend to the shores of the Salat Tabrau, and the islands of Tekong and Pulo Ubin which lie within the strait. In this district there were 9652 individuals, viz. 4256 Malays, of whom 2030 were females; 3170 Chinese, of whom 72 only were females; 1414 Bugis, of whom 672 were females; and the remainder 671 were made up of Javanese, Balinese, and a few Bengalees and Klings. The islands of Tekong and Ubin contained 1981 inhabitants.

The population is composed of nearly all the nations of Southern Asia and the Indian Archipelago, among whom a small number of individuals of European origin have settled, as appears from the following table, which also shows the increase of the population in two years, and the disproportion between males and females:—

Population of the Island of Singapore in 1824 and 1836.

Nations constituting the Population.	1824. Males.	1824. Females.	1836. Males.	1836. Females.

These censuses do not include the military, their followers, nor the convicts, as Singapore is a place of banishment from Calcutta and other parts of Hindostan. The number of these classes of inhabitants may be estimated at about 1200. The Europeans and Chinese constitute the wealthier classes. The Europeans are for the most part merchants, shopkeepers, and agents for mercantile houses in Europe. Most of the artisans, labourers, agriculturists, and shopkeepers are Chinese. The Malays are chiefly occupied in fishing, collecting sea-weed, and cutting timber, and many of them are employed as boatmen and sailors. The Bugis are almost invariably engaged in commerce, and the natives of India as petty shopkeepers, boatmen, and servants. The Chuliahs and Klings are daily labourers, artisans, and petty traders. The Caffres are the descendants of slaves, who have been brought by the Arabs from the Arabian and Abyssinian coasts. The most useful are the Chinese settlers. A common Chinese labourer gets from four to six Spanish dollars a month, a Kling from three to four and a half, and a Malay from two and a half to four and a half. A Chinese carpenter will earn about fifteen dollars a month, a Kling eight, and a Malay only five. The immigration of the Chinese is much favoured by circumstances. Among the dense population of China there are many paupers, who are a burden to the state, and the government connives at the poorer classes quitting the country, though it is contrary to their ancient laws. The poor Chinese leaves his country without a penny, and agrees with the captain of the junk to pay from eight to twelve dollars for the passage. On landing he enters into one of the secret societies, which are always formed by the Chinese, and the society pays the passage-money and engages his services. In three months he has generally paid his debt, and then he begins to make his fortune. The Chinese emigrants at Singapore and Penang are mostly from Canton, Macao, or Fokien. Many of those of Fokien become merchants, and show a strong propensity to speculate largely. The Canton emigrants are the best miners and artisans.

It is very probable that the population of the settlement now (1841) amounts to more than 36,000 individuals, which gives more than 130 individuals to a square mile, which is a considerable population even in a country that has been settled for centuries, and is certainly a very surprising population in a country which twenty years ago was a desert.

The town of Singapore stands on the southern shores of the island, in 1° 17′ 22″ N. lat. and 103° 51′ 45″ E. long., on a level and low plain of inconsiderable width, fronting the harbour. It extends about two miles along the shore, but only a thousand yards inland, where it is enclosed by hills from 100 to 150 feet high. The commercial portion of the town occupies the most western extremity, and is separated from the other parts by a salt creek, called the Singapore river, which is navigable for small craft. A good wooden bridge connects it with the eastern part, which contains the dwellings of the Europeans, the public offices, and the military cantonments. Contiguous to this portion of the town is the government-house, which is built on a hill. The most eastern part is occupied by the sultan of Johore, the Malays, and Bugis. The whole of the warehouses, and all the dwelling-houses in the principal streets in their vicinity, are built of brick and lime, and roofed with red tiles. The more distant dwelling-houses are built of wood, but roofed with tiles. It is only on the distant outskirts of the town that there are huts with thatched roofs. The Malays and Bugis live in huts. The population (16,148 individuals) consisted, in 1836, of 8233 Chinese, 3517 Malays, 2157 Chuliahs and Klings, and the remainder was made up by Javanese, Bengalees, Bugis, native Christians, and Europeans. Ships lie in the roads of Singapore at the distance of from one to two miles from the town, according to their draught. With the assistance of lighters, cargoes are discharged and taken in with scarcely any interruption throughout the year.

The lighters convey the goods to the river of Singapore, where they discharge them at a convenient quay, and at the door of the principal warehouses. There is no want of common artisans. The Chinese follow the occupations of shoemakers, bakers, butchers, blacksmiths, gunsmiths, goldsmiths, and carpenters; they also manufacture pearl sago on an extensive scale, for the European market, the material being obtained from the island of Sumatra. They also employ a great number of forges, in which native arms and domestic and agricultural implements are made. These latter articles are mostly sent to the settlements of the Chinese on the different islands of the Indian Archipelago.

The principal public buildings at Singapore are the government-house, a court-house, a gaol, custom-house, Mission chapel, and the Singapore Institution. Sir Stamford Raffles formed a very extensive plan for this institution, which however has not been carried into effect. At present it consists of three schools, English, Malay, and Tamul, and the number of scholars amounts to upwards of seventy. A Chinese school on a large scale was contemplated in 1837, and has probably been opened. Some Chinese youths are to be admitted as students, to reside at the institution, and to receive instruction both in English and Chinese for a term of four or five years. There are several native schools in the town.

If the commerce of Singapore were limited to the produce of the place, it would hardly give employment to two or three vessels. Besides the pearl sago and the iron implements, it exports only a small quantity of pepper and gambier, and perhaps at present coffee of its own growth, together with a large quantity of aggar-aggar. But Singapore has become the London of Southern Asia and the Indian Archipelago. All the nations that inhabit the countries bordering on the Indian Ocean resort to it with the produce of their agriculture and manufacturing industry, and take in exchange such goods as are not grown or produced in their own countries. All of them find there a ready market, which at the same time is well stocked with European goods. This effect has partly been produced by the wise policy of declaring the harbour of Singapore a free port, in which no export or import duties, nor any anchorage, harbour, nor lighthouse fees are levied. The effect of this policy was evident even at the beginning of the settlement. In the first year the exports and imports by native boats alone exceeded four millions of dollars, and during the first year and a half no less than 2889 vessels entered and cleared from the port, of which 383 were owned and commanded by Europeans, and 2506 by natives: their united tonnage amounted to 161,000 tons. In 1822 the tonnage amounted to 130,689 tons, and the total value of exports and imports to upwards of eight millions of dollars.

Number and tonnage of square-rigged vessels which entered into and cleared at the port of Singapore in 1835 *and* 1836.

According to this statement the number of vessels which entered the port in 1836 exceeded the number in 1835 by 22, and by 9540 tons; and the number of vessels which cleared out in the first-mentioned year exceeded that of the preceding year by 16, and by 9443 tons. This statement however does not include the native craft, which are largely used in the intercourse with Sumatra, the Malay Peninsula, Rhio, Borneo, and the neighbouring islands, and which in 1836 amounted to 1484, of 37,521 tons. If these are added, the shipping that entered the port in 1836 amounted to 203,574 tons.

The commerce of the newly established colony increased at first with incredible rapidity. In the year 1824, only five years after its foundation, the imports amounted to 6,914,536 Spanish dollars, and the exports to 6,604,601. In the following year however it suffered some slight diminution, and it may be said that it has been nearly stationary since that period; for in 1835 the imports amounted only to 6,611,778 dollars, and the exports to 6,238,131. In the former account however the exports to and the imports from Malacca and Penang probably were included, whilst they were not taken into account in 1836. In this year goods to the value of 160,970 dollars were imported from Malacca, and others amounting to 168,867 dollars exported to that settlement. The commercial intercourse with Penang was much more important; the goods imported from that settlement were to the value of 426,176 dollars; and those that were exported rose to 544,640 dollars. If these sums are added, the exports in 1835 amounted to 7,325,285 dollars, and the imports to 6,825,277; and the whole commerce exceeded that of 1824 by 631,425 dollars. From 1835 an increase both in imports and exports took place; for in the year ending with the 30th of April, 1837, the imports amounted to 8,243,629 dollars, and the exports to 7,806,965 dollars, exclusive of the trade with Malacca and Penang, so that the difference between that year and the preceding was 1,900,032 Spanish dollars.

The commerce of Singapore may be divided into the Eastern trade, that of the Straits, and the Western trade. The Eastern trade, or that which is carried on with the countries east and south-east of Singapore, comprehends the commerce with China, the Spanish settlement of Manilla, the independent tribes of the Indian Archipelago, the Dutch settlements on the island of Java and at Rhio, and the countries of the Peninsula beyond the Ganges which lie east of the Malay Peninsula. The most important branches of this commerce are those with China, Java, and Siam.

The commerce with China is entirely carried on in Chinese vessels. The Chinese junks come from the ports of Canton, Changlim, and Ampo, in the province of Quantong, from Amoy in the province of Fokien, and from the island of Hainan. They leave their respective ports during the north-east monsoon, about January, and return with the south-west monsoon, which blows from April to October. They perform the voyage from Canton in from 10 to 20 days, and from Fokien in 12 or 15 days. The most valuable, but not the largest of the Chinese junks are from Amoy; the largest come from the province of Quantong, and the smallest and least valuable from Hainan. They bring annually from 2000 to 2500 emigrants to Singapore. The imports from China amounted, in the year ending the 30th of April, 1836, to 712,265 dollars; the most important articles were Spanish dollars, 138,927 in number; raw silk, 113,942 dollars; chinaware, 93,902; tea, 57,509; tobacco, 47,239; cassia, 93,092; nankeens, 25,715; and gold thread, 11,016 dollars. Minor articles were camphor, copperware, earthenware, ironware, paints, piece-goods, salt, sugar-candy, and woollens. The imports entered under the head of sundries amounted to 152,440 dollars. The exports to China amounted in the same year to 1,079,752 dollars, and consisted chiefly of opium and such articles as had been brought to Singapore from the Indian archipelago. Next to opium, which amounted to 252,327 dollars, the most important articles were edible birds'-nests, to the amount of 162,852; tin, 117,386; and trepang, 74,723 dollars. Rice was sent there to the amount of 59,408; pepper, 56,023; betel-nut, 44,962; and ratans, 36,019 dollars. Other articles of importance were woollens (25,064 d.), European piece-goods (20,796 d.), cotton-twist (18,100 d.), raw cotton (16,155 d.), aggar-aggar (16,100 d.), camphor barus (16,155 d.), spices (11,314 d.), tortoise-shell (12,684 d.), sandal-wood (11,143 d.), and lakka-wood (10,800 d.). Minor articles were antimony, birds' feathers, canvas, dragon's-blood, gambier, gold-dust, glassware, European gold thread, hides, garro-wood, spirits, and sundries. Spanish dollars were sent to China to the amount of 21,914.

The commerce between Singapore and Manilla is carried on partly by Spanish and partly by American and English vessels. In the year ending on the 30th of April, 1836, the imports from that settlement into Singapore amounted to 156,047 dollars, of which cigars constituted more than one-half the amount, viz. 89,150 dollars. Sugar was brought to the amount of 25,190 dollars, and the other minor articles were trepang, cotton, hides, indigo, mother-of-pearl shells, rice, wines, sapan-wood (2402 d.), spirits, and sundries (2642 d.). Cheroots were imported to the amount of 2252 dollars, and also 3000 dollars.

The trade with Celebes is almost exclusively in the hands of the Bugis of Waju, a country on the western side of that island, the inhabitants of which have colonized many parts of the Indian Archipelago, and carry on what may be called the foreign trade of the countries in which they have settled. They disperse the goods obtained at Singapore over most of the islands east of Celebes, as far as the coast of New Guinea, and also over that chain of islands called the Lesser Sunda Islands. [SUNDA ISLANDS.] Their country vessels, called *prahus*, arrive at Singapore during the prevalence of the eastern monsoon. The goods brought by the Bugis from Celebes in 1835 amounted to 214,705 dollars. The most important articles were tortoise-shell (51,978 d.), gold-dust (23,230 d.), mother-of-pearl shells (21,227 d.), coffee (14,078 d.), trepang (19,755 d.), birds'-nests (10,190 d.), and rice (10,501 d.). Minor articles were birds' feathers and birds of paradise, bees'-wax, hides, oils, paddy, ratans, aggar-aggar, spices, and tobacco. The importation of sundries amounted to 23,287 dollars, and 21,650 dollars in specie were also brought to Singapore. The value of the goods exported to Celebes was 339,706 dollars, and the principal articles were derived from Europe and Hindustan, viz. opium (71,169 d.), India piece-goods (66,230 d.), European piece-goods (47,401 d.), cotton-twist (44,244 d.), and copper coin brought from England (12,076 d.). The exportation of raw silk (17,495 d.) and of gambier (13,544 d.) was also considerable. Minor articles were arms, benjamin, or benzoin, chinaware, earthenware, gold thread, ivory, iron and steel (7312 d.), ironware and cutlery (5516 d.), nankeens, stick-lac, tobacco (7869 d.), and woollens (7547 d.). Besides, there went 8792 dollars in specie and 4000 Java rupees.

The commerce between Singapore and the northern coast of Borneo is almost exclusively carried on by native vessels, many of which are of great size; some of them are managed by Bugis. The articles imported from that island in 1835 amounted to 208,074 dollars. The most important article was gold-dust, to the value of 128,728 dollars. Other articles of importance were edible birds'-nests (28,055 d.), ratans (16,270 d.), antimony-ore (20,272 d.), pepper (17,847 d.), and camphor barus (10,475 d.). Minor articles were sago (7144 d.), tortoise-shell (4674 d.), bees'-wax (4800 d.), trepang (3007 d.), ebony, hides, rice, sugar, tobacco, garro-wood (3987 d.), and lakka-wood (4472 d.). The sundries amounted to 1137 dollars, and the dollars in specie to 5290. The goods exported to Borneo were to the value of 231,242 dollars. The largest articles were India piece-goods (110,034 d.), opium (73,490 d.), nankeens (17,411 d.), Malay piece-goods (17,024 d.), and European piece-goods (9450 d.). There were also arms (4207 d.), iron and steel (6773 d.), ironware and cutlery (4449 d.), raw silk (5155 d.), china-ware (7136 d.), gambier (7792 d.), cotton-twist (2627 d.), gunpowder (3401 d.), and China sundries (2309 d.). Minor articles were anchors, benjamin, earthenware, ivory, rice, salt, saltpetre, stick-lac, tea, tobacco, woollens, Java and Eastern sundries. To these were added 6389 dollars in specie, Java rupees to the amount of 4840 dollars, and copper coin to the amount of 100 dollars.

An active commerce is carried on between Singapore and the great settlement of the Dutch at Rhio. [RHIO.] The imports into Singapore from that place amounted, in 1835, to 144,535 dollars, of which the pepper alone amounted to 49,515 dollars, and the rice to 12,347. Minor articles were bees'-wax, cotton, gambier, hides, sugar, tin (3700 d.), and Java sundries; there were also 7925 dollars in specie imported. The exports to Rhio amounted to 167,461 dollars, and consisted especially of dollars in specie (84,862), European piece-goods (15,378 d.), India piece-goods (16,940 d.), rice (12,911 d.), and opium (4589 d.). Minor articles were anchors and grapnels, arms, chinaware, ebony, iron and steel, lead, oils, paints, ratans, raw silk, sago, salt, spelter, tea, lakka-wood, and sundries, with Java rupees amounting to 400 dollars.

The direct commerce between Singapore and Java is limited to the three ports of Batavia, Samarang, and Surabaya, but European and India goods may be shipped from these places to any other Dutch settlement on the island of Java or on the other islands of the Archipelago, the Moluccas excepted. The exports of Java to Singapore, in 1835, amounted to 578,471 dollars. The most considerable articles were—tin (153,597 d.), European piece-goods (142,317 d.), birds' nests (101,947 d.), and rice (65,475 d.). Next to these were tobacco (44,130 d.), spices (31,045 d.), ratans (34,559 d.), spirits, especially hollands (25,039 d.), Java sundries (20,145 d.), pepper (19,176 d.), sandal-wood (18,499 d.), sugar (17,042 d.), gold-dust (14,673 d.), cotton (10,751 d.), and tortoise-shell (10,029 d.). The importations were—woollens (9294 dollars), European sundries (8098 d.), arrack (7658 d.), hides (7319 d.), glass-ware (6875 d.), mother-of-pearl shells (5364 d.), and cotton-twist (4223 d.). Minor articles were camphor, camphor barus, coffee, copper-ware, copper sheathing, ebony, ivory, indigo, oils, paints, provisions, spelter, stick-lac, sugar-candy, tea, wine, garro-wood, and Eastern sundries. There were also brought to Singapore 49,574 dollars in specie, Java rupees to the amount of 4709 dollars, doubloons (380 dollars), and sovereigns (150 dollars). The exports from Singapore to the ports of Java were of the value of 566,470 dollars. The most valuable articles were India piece-goods (135,790 d.), opium (118,403 d.), and China sundries (79,799 d.). Next to these were raw silk (40,134 d.), cigars (27,112 d.), china-ware (22,076 d.), gunnies (15,232 d.), tea (14,910 d.), wheat (11,740 d.), and nankeens (10,994 d.); European sundries (9231 d.), China piece-goods (7617 d.), India sundries (7259 d.), copper (6493 d.), pepper (6914 d.), iron and steel (6237 d.), Straits sundries (4935 d.), tobacco (4929 d.), saltpetre (4449 d.), tin (4000 d.), and cassia (3940 d.). Minor articles were arms, benjamin, bees'-wax, canvas, cordage, dragons'-blood, earthenware, glue, glass-ware, gunpowder, ivory, lead, oils, provisions, European piece-goods, Malay piece-goods, sago, stick-lac (3759 d.), woollens, and American sundries (2052 d.). There are still to be added 7024 dollars in specie, and Java rupees to the amount of 2000 dollars.

The island of Bally, whose surface does not much exceed 2000 square miles, sent to Singapore goods to the amount of 59,724 dollars, of which the rice alone fetched 37,274 dollars; the tobacco 8288 d., the tortoise-shell 4001 d., and the edible birds'-nests 2755 d. Minor articles were trepang, bees'-wax, coffee, hides, sandal-wood, and Eastern sundries (1239 d.); also 4179 dollars in specie. The goods exported from Singapore to Bally amounted to 65,973 dollars, and consisted especially of opium (24,264 d.), copper coin (13,330 d.), India piece-goods (10,119 d.), and European piece-goods (4583 d.), with several minor articles, as arms, chinaware, earthenware, gold thread, ivory, ironware, China piece-goods, raw silk, woollens, and China sundries, with 200 dollars in specie.

The commerce between Singapore and the several islands which lie in the sea between the settlement and Java, including Banca, is also considerable. The goods brought from them amounted to 132,536 dollars. The larger articles were tin (47,461 d.), trepang (10,662 d.), India sundries (7942 d.), Eastern sundries (5622 d.), pepper (5089 d.), aggar-aggar (4869 d.), and tortoise-shell (4852 d.). Minor articles were bees'-wax, birds'-nests, chinaware, coffee, ebony, ghee, gambier, gold-dust, gram, oils, paddy (3512 d.), ratans, rice, sago, tobacco, wheat, garro-wood, and sapan-wood. There were also 12,296 dollars in specie sent to Singapore. The exports from our settlements amounted to 101,190 dollars, and consisted principally of opium (18,528 d.), India piece-goods (12,150 d.), rice (11,802 d.), raw silk (6858 d.), European piece-goods (5829 d.), and Malay piece-goods (3947 d.). Minor articles were anchors, arms, cotton-twist, earthenware, gambier, gold thread, gunpowder, iron and steel, ironware, nankeens, oils, sago, stick-lac, sugar, tea, tobacco (2500 d.), wheat, garro-wood, spirits, and sundries. Besides, 17,110 dollars in specie and 300 dollars in copper coin were exported.

The commerce between Singapore and Siam is mostly carried on by the Chinese who are settled in that country.

and in junks built at Bangkok and other places. The imports from Siam amounted, in the year terminating with the 30th of April, 1836, to 282,019 dollars. The principal articles were sugar (114,453 d.), rice (43,330 d.), stick-lac (18,264 d.), iron-ware (12,379 d.), sapan-wood (11,674 d.), oils (8485 d.), salt (7959 d.) and Eastern sundries (6483 d.). Minor articles were china-ware (2147 d.), hides, ivory, paddy, India piece-goods, raw silk, sugar-candy (2250 d.), tea, spirits, and China sundries. The imported silver consisted of 12,120 dollars, and ticals to the amount of 35,913 dollars. The goods imported into Siam were of the value of 180,604 dollars. The principal articles were European piece-goods (58,155 d.), India piece-goods (26,845 d.), cotton-twist (19,913 d.), opium (18,925 d.), ratans (9533 d.), ebony (9200 d.), bees'-wax (8475 d.), woollens (5085 d.), gambier (4708 d.), and iron and steel (4560 d.). Minor articles were anchors, arms, betel-nut, earthenware, lead, lakka-wood, and European, India, China, and Eastern sundries. Only 400 dollars, and cowries to the amount of 100 dollars, were sent to Siam.

The commerce with Cochin China is much less considerable. It is likewise carried on by the Chinese settled at Kangkao and Saigun in Camboja, and at Quinhon, Faifo, and Hué in Cochin China. In 1835 the imports from these places amounted to 62,319 dollars, and consisted chiefly of sugar (27,055 d.), rice (10,356 d.), copper (9300 d.), and salt (4388 d.), with some ebony, indigo (2970 d.), iron, oils, raw silk, tea, and Eastern sundries. The exports amounted to 91,073 dollars, and the principal articles were woollens (28,534 d.) and opium (26,019 d.). The other articles, as arms, canvas, copper sheathing, gambier (4708 d.), iron, iron-ware (2485 d.), lead, piece-goods, ratans, saltpetre, spelter, tea, tobacco, sapan-wood, European sundries (3267 d.), and China and Eastern sundries, amounted in general to small sums; but 9500 dollars in specie were exported.

The commerce of the Straits is carried on with the Malay Peninsula and with the island of Sumatra. The harbours on the eastern side of the peninsula, which trade with Singapore, are Pahang, Tringanu, and Calantan, and this trade is rather active. The trade with the western coast of the peninsula is not important, and is almost entirely limited to the harbour of Salangore. In 1835 the imports from these places to Singapore were 319,134 dollars. The most valuable articles were gold-dust (145,040 d.) and tin (107,670 d.). Pepper amounted to 11,273 dollars, and sugar to 4210 dollars. The other articles were trepang, bees'-wax, birds'-nests, coffee, ebony, ghee, hides, ivory, iron-ware, ratans (2216 d.), raw silk, rice, stick-lac, tortoiseshell, garro-wood, lakka-wood, and several other articles; 31,313 dollars were also imported. The exports in 1835 amounted to 316,370 dollars. The principal article was opium, to the amount of 169,348 dollars, and next to it followed cotton-twist (40,867 d.), tobacco (30,034 d.), Malay piece-goods (21,538 d.), European piece-goods (14,994 d.), and India piece-goods (9474 d.). Minor articles were arms, bees'-wax, cotton, earthenware, gambier, iron and steel (3431 d.), iron-ware and cutlery, raw silk, salt, and several sundries. There were also 14,408 dollars sent from Singapore to these ports.

The commerce between Singapore and the island of Sumatra is almost entirely limited to the ports along the eastern coast of the island; there is hardly any commercial intercourse with the Dutch settlements of Bencoolen, Padang, and Trappanuli, which are on the western coast. The commerce of the eastern coast is divided between Singapore and Penang. The ports south of the free port of Batu Bara send their goods to Singapore, whilst those which are farther north visit Penang. The harbours connected with the first-named settlement are Campar, Siack, Indragiri, Iambie, Assahan, and Batu Bara. The goods imported from these places amounted to the sum of 130,921 dollars. The principal articles were coffee (44,842 d.), betel-nut (24,946 d.), cotton (12,134 d.), sago (10,972 d.), ratans (8261 d.) gold-dust (5936 d.), and benjamin (4652 d.). Minor articles were trepang, bees'-wax (3712 d.), dragon's-blood, gambier, hides, ivory, iron, iron-ware, mother-of-pearl shells, paddy, pepper, rice (3682 d.), spices, tortoise-shell, lakka-wood, and several sundries. There were also sent to Singapore 1250 dollars, and Java rupees to the amount of 300 dollars. The goods exported to these places amounted to the value of 165,601 dollars. The principal articles were India piece-goods (37,774 d.), European piece-goods (16,443 d.), raw-silk (12,680 d.) opium (11,767 d.), Malay piece goods (10,937 d.), China sundries (8995 d.), iron (6390 d.), and salt (5915 d.). Minor articles were arms (2475 d.), brass-ware, china-ware (3196 d.), copper sheathing, cotton-twist, earthenware, gold thread, gunpowder, iron-ware, nankeens, oils, stick-lac, tea, tobacco, wheat, woollens, and several sundries. There were also sent to Sumatra 26,906 dollars, and Java rupees to the amount of 1800 dollars.

The western trade of Singapore comprehends that with Calcutta, Madras, Bombay, the island of Ceylon, and Arabia, with the Cape of Good Hope, Mauritius, and Australia, and with Europe and America. In the commerce which is carried on between Singapore and Calcutta larger capitals are employed than in that with China or Great Britain. The imports from Calcutta amounted, in 1835, to 1,191,390 dollars. The principal article was opium, of which 1640 chests, of the value of 957,855 dollars, were imported. Next to it were India piece-goods, which amounted to 135,679 dollars; gunnies (24,745 d.), cotton (21,060 d.), rice (14,042 d.), wheat (13,978 d.), India sundries (8024 d.), and saltpetre (7451 d.). The other articles, as brass-ware, canvas, copper-ware, cordage, copper sheathing, ebony, ghee, hides, mother-of-pearl shells, tobacco, and European sundries, amounted only to small sums. The exports from Singapore to Calcutta were to the value of 876,851 dollars. The most valuable article was gold-dust, which amounted to 473,565 dollars. Tin was sent to the amount of 69,045 dollars, pepper 44,839 d., cigars 29,550 d., European piece-goods 20,669 d., sapan-wood 18,829 d., spirits 17,992 d., ratans 13,465 d., gambier 10,230 d., Java sundries 8402 d., spices 6333 d., Eastern sundries 5721 d., canvass 5931 d., cotton-twist 5619 d., European sundries 4712 d., and tea 4510 d. Minor articles were anchors and grapnels (2014 d.), arms, benjamin, bees'-wax, betel-nut (3589 d.), cassia (3951 d.), copper, cordage, glass-ware, iron and steel, sago (3142 d.), sugar-candy, tobacco, wine, sandal-wood, woollens, and India, China, and American sundries (3916 d.). From Singapore there were sent to Calcutta 70,189 dollars, sicca rupees to the amount of 5092 dollars, Java rupees 1943 dollars, sycee silver 650 dollars, ticals 25,004 dollars, sovereigns 475 dollars, gold mohurs 93 dollars, and cowries 2989 dollars.

The commerce with Madras is much less important. The imports from that place to Singapore amounted only to 151,133 dollars. The largest article was India piece-goods (132,679 d.), and all the others, except ebony (6822 d.), amounted to small sums, and were trepang, earthenware, ghee (2993 d.), mother-of-pearl shells, European piece-goods (2880 d.), rice, wine, spirits, and a few sundries. The exports to Madras amounted to 138,365 dollars, and consisted principally in money, viz. 99,758 dollars in specie, ticals to the amount of 17,000 dollars, sicca rupees 311 dollars, and Java rupees 125 dollars. Cigars, amounting to 5187 dollars, were the most important article. Other articles were benjamin, chinaware, cordage, earthenware, gold-dust, glassware, iron and steel, ironware (2984 d.), European piece-goods, ratans, sago, spices, sugar-candy, woollens (2168 d.), spirits, and some sundries.

The commerce with Bombay is more important. The imports from that place amounted to 156,904 dollars. Opium was to the amount of 117,195 dollars, and India piece-goods 19,578 dollars. The other articles were of little value, and consisted of brassware, cotton (2308 d.), grain, saltpetre, tortoiseshell, woollens, and a few sundries; there were also imported 13,000 dollars. The exports to Bombay amounted to 196,757 dollars. The largest articles were gold-dust (38,683 d.), tin (31,050 d.), sugar (30,489 d.), spices (17,051 d.), piece-goods (11,202 d.), ratans (7598 d.), and cigars (5441 d.). Minor articles were benjamin, betel-nut, cassia (2962 d.), gambier, ivory, oils, pepper, raw silks, sago, garro-wood (3360 d.), sapan-wood, spirits, and several sundries. Bombay received also from Singapore 30,437 dollars, ticals to the amount of 5896 dollars, Bombay rupees 371 dollars, gold coins 92 dollars, and doubloons 62 dollars.

The exports from Singapore to Ceylon amounted only to 3849 dollars, and consisted of chinaware (1097 d.), ratans, cigars, sugar (1358 d.), and a few sundries. But Ceylon sent to Singapore goods to the amount of 30,876 dollars, of which ebony alone was of the value of 19,872 dollars. The other articles, except cordage (4669 d.), were small, and consisted of trepang, birds' feathers, canvas, ghee, hides, India piece-goods, wheat, spirits, and some sundries.

The imports from Arabia to Singapore amounted only to 6395 dollars, and consisted of India sundries (4240 d.), and small quantities of gold thread, tortoiseshell, oils, and salt.

that Singapore exported to Arabia, probably on account of the pilgrims who go from the Malay Peninsula and the Indian Archipelago to Mecca, the value of 70,153 dollars, of which 41,000 dollars were in specie. The largest articles of goods were benjamin (8709 d.), tin (6779 d.), sugar (5858 d.), and sapan-wood (4710 d.). Minor articles were gold-dust (867 d.), pepper, India piece-goods, rice, sago, spices, sugar-candy, sapan-wood, and a few sundries.

The imports into Singapore from the Cape, Mauritius, and Australia amounted only to 4860 dollars, of which 2700 were in specie, to which arms and ebony in small quantities were added. But Singapore exported to these places goods to the amount of 86,674 dollars. The most important articles were tin (12,370 d.), sugars (11,270 d.), wheat (11,077 d.), Eastern sundries (8739 d.), sugar (8425 d.), and coffee (5960 d.). The other articles were of less importance, and consisted of antimony, bees'-wax, canvas, cassia, cordage (3087 d.), gram, gambier, gold-dust, gunnies, opium (3440 d.), pepper, paddy, provisions (2392 d.), rattans, rice (2538 d.), sago, sugar-candy, tea (2260 d.), tobacco, wines, spirits, and European sundries (3210 d.).

The United States of America carry on an active commerce with Singapore, but as most of their goods are not adapted for the market of Southern Asia, they generally pay for the goods that they buy with ready money. They imported 87,800 Spanish dollars, and also manufactured goods (14,845 d.), provisions (9953 d.), and American sundries (9122 d.). Minor articles were canvas, cordage, gunpowder, hides, cigars, and tobacco (1236 d.). The whole importation amounted to 136,597 dollars, whilst the articles exported were of the value of 177,528 dollars. The most important articles among the exports were tin (43,751 d.), sugar (35,764 d.), coffee (34,279 d.), pepper (19,793 d.), tortoise-shell (6784 d.), rice (6258 d.), and gunnies (5760 d.). Minor articles were antimony, betel-nut, canvas, cassia (3986 d.), cordage, dragon's-blood, gambier, hides, oils, opium (2560 d.), India piece-goods, rattans (2117 d.), sago, cigars, spices (1400 d.), tea, and several sundries.

As to the harbours of continental Europe, that of Hamburg had the greatest share in this trade. But the imports from these places amounted only to 65,657 dollars, and the largest articles were spirits (12,876 d.), piece-goods (12,700 d.), wine (10,578 d.), and European sundries (16,384 d.). Minor articles were arms, canvas (3000 d.), cordage (2860 d.), cotton-twist (2340 d.), glassware, gold thread, iron (2161 d.), ironware, lead, oils, paints, provisions, salt, and woollens. The goods exported from Singapore to these parts amounted to 113,303 dollars. The largest articles were coffee (42,649 d.), tin (23,319 d.), sugar (18,942 d.), pepper (13,772 d.), European sundries (3127 d.), and cassia (5882 d.). Minor articles of export were bees'-wax, cordage, gold-dust, hides, rice, rattans, sago (2084 d.), cigars (2386 d.), tortoise-shell, sapan-wood, arrack, and some sundries.

The commerce of Singapore with Great Britain is nearly equal to that with Calcutta, and more active than that with China. Great Britain imported into the port of Singapore in the year ending with the 30th of April, 1836, goods to the amount of 1,150,800 dollars. The most important article consisted of several kinds of piece-goods, to the amount of 678,776 dollars. Other articles of importance were cotton-twist (58,994 d.), European sundries (56,772 d.), iron (49,403 d.), woollens (48,376 d.), arms (45,778 d.), earthenware (31,456 d.), glassware (21,420 d.), gunpowder (20,793 d.), copper sheathing and nails (16,729 d.), ironware and cutlery (15,486 d.), anchors and grapnels (14,363 d.), and wines (13,448 d.). The importations were—beer (8251 d.), canvas (5183 d.), cordage (5684 d.), opium (8002 d.), paints (2977 d.), provisions (4720 d.), spelter (5778 d.), and spirits (4793 d.). Minor articles were brass-ware, gold thread, lead, and tea. Great Britain sent also to Singapore 17,000 Spanish dollars, and copper coin to the amount of 25,072 dollars. The goods shipped at Singapore for Great Britain amounted to the value of 890,017 dollars. The most important articles were tortoise-shell (125,101 d.), tin (101,984 d.), pepper (91,289 d.), raw silk (79,670 d.), sugar (62,469 d.), Eastern sundries (59,886 d.), coffee (53,844 d.), tea (24,376 d.), sago (35,991 d.), spices (34,929 d.), mother-of-pearl shells (27,570 d.), China sundries (23,544 d.), bees'-wax (22,636 d.), cassia (22,398 d.), antimony (18,704 d.), gambier (18,339 d.), hides (17,950 d.), benjamin (8709 d.), Java sundries (7982 d.), rattans (6968 d.), Straits sundries (5942 d.), and ivory (5650 d.). Minor articles were birds' nests and birds of paradise, camphor, cordage (2524 d.), coloured cotton-twist (2541 d.), dragons'-blood, ebony, gold-dust (2355 d.), nankeens (2140 d.), oils, China piece-goods, rice, cigars, wines, sapan-wood (4469 d.), and India sundries (4356 d.). There were also sold to Great Britain 25 sovereigns, and cowries to the value of 1080 dollars.

Such is the state of the commerce of Singapore at present, but it will probably increase largely in a few years. If the Chinese government continue the vexatious restrictions on our commerce at Canton, it may be expedient to discontinue the direct commercial intercourse with the Celestial empire. Instead of Canton, the settlement of Singapore would be the market to which tea and other articles of Chinese industry would be brought, and our goods adapted for their consumption would be sold. The consumption of all these articles, with the exception of opium, would probably be much increased by such a change, for the Chinese themselves would be able to sell their goods at a less price at Singapore than we have hitherto paid for them at Canton. Our vessels and merchants have to pay very heavy dues, whilst Chinese vessels pay very little in comparison, and are almost entirely free from dues whenever a part of their return cargo consists of rice. This article is at present always to be had at Singapore, and might be grown to an indefinite extent in the eastern districts of Sumatra and in our Tenasserim provinces, if there was a demand for it. Thus it is probable that the Chinese junks would be able to sell tea and other articles at least 10 per cent. less than we pay for them at Canton; besides, the tea is brought to Canton by a transport over land of many hundred miles, whilst the countries in which it grows are near the sea; and it could be brought directly from Amoy, Ningpo, and Shanghae, to Singapore, at a much less expense. The only difference would be, that our vessels, instead of proceeding to Canton, would stop at Singapore; but that can hardly be considered a loss, when we reflect that the increased consumption of Chinese goods, in consequence of the decrease in price, would certainly be attended by an increase of our shipping.

History.—On the site of the present British settlement formerly stood the capital of a Malay kingdom. According to the history of that nation, Sang Nila Utama, from Menangkabau in Sumatra, founded the city of Singhapura (the lion's town) about 1160, and Raffles was able in 1819 to trace the outer lines of the old city. It then was the capital of the kingdom of Malacca. This town was taken in 1252 by a king of Java, and the residence of the king was transferred to the town of Malacca, which was then founded. After that event the town seems gradually to have decayed, and the country to have been abandoned; for when the British, after having restored the town of Malacca to the Dutch in 1816, wished to form a settlement on the shores of the Strait of Malacca or its neighbourhood, that they might not be entirely excluded from the commerce of the Indian Archipelago by the Dutch, they found on their arrival at Singapore that the population of the whole island did not exceed 150 individuals, as already stated. It was then a part of the kingdom of Johore, which had been so reduced by internal discord, that some of the superior officers had become independent. One of them, the Tumongong, or chief justice, had got possession of the island of Singapore and the adjacent country, and from him the British obtained, in 1819, permission to build a factory on the south shore of the island. Soon afterwards a person who had some claim to the throne of Johore came to the British settlement and received a small pension. From this person, who was afterwards king of Johore, and the Tumongong, the British obtained, in 1824, the sovereignty and fee-simple of the island, as well as of all the seas, straits, and islands, for the sum of 60,000 Spanish dollars, and an annuity of 24,000 Spanish dollars for their natural lives. In 1826 Singapore was placed under the provincial government of the Straits Settlement, which is fixed on the island of Penang.

SINIGAGLIA. [PESARO ET URBINO.]

SINKING FUND. [NATIONAL DEBT.]

SINO'PE, or SINUB. [PAPHLAGONIA.]

SINTOC, or SINDOC, sometimes written Syndoc, is the bark of a species of Cinnamomum, which has been called C. Sintoc by Blume, who says it is a tree 80 feet in height, indigenous in the primeval forests of Java. It is in flattish pieces, of a warm spicy taste, but is seldom seen in this country. It resembles the Calilawan bark, called clove-bark by some, which is called *kulit-lawan* by the natives of Java, and is the produce of a nearly-allied species, the *Cinnamomum Calilawan* of Blume, which grows in similar situations with the former, and of which the bark is used as a spice, and its essential oil is employed as a medicine and as a perfume by the Javanese.

SIOUX INDIANS, one of the most numerous and powerful of the native tribes within the territories of the United States of North America. They inhabit a large tract between 42° and 49° N. lat. and 90° 30′ and 99° 30′ W. long., comprehending nearly the whole of the country between the Mississippi on the east and the Missouri on the west, north of 42° 30′ N. lat., or the present territory of Iowa. They also occupy a large tract of the territory of Wisconsin on the east of the Mississippi, extending along the river from Fort Crawford on the south to the St. Croix river, and the whole country west of the last-mentioned river as far north as Lake Spirit, and westward to the eastern banks of the Mississippi. In these parts their country borders on that of the Algonquins, who occupy the tract west of Lake Superior, but along the banks of the Red River of Lake Winnipeg the Sioux claim the whole tract to the boundary-line of the United States (49° N. lat.). On the banks of the Missouri they are found near Fort Mandan on the north (47° 30′), and at the mouth of the Soldiers' River (42°) on the south, and it is stated that they hunt in the country west of the Missouri between 43° and 47° N. lat. The southern boundary of their country may be marked by a line drawn from the mouth of Soldiers' River to Fort Crawford.

The Sioux Indians call themselves Dacotas, but in their external relations they assume the name of Ochente Shakoan (the nation of the seven fires or councils), a name which refers to a division into seven great tribes, of which they were formerly composed. The French Canadians divide them into Gens du Lac and Gens du Large. The former once lived about Spirit Lake, and are now principally found along the banks of the Mississippi. They live in villages, and have begun to apply themselves to the cultivation of the ground. The Gens du Large, under which name the greater number of the tribes are comprehended, rove about in the prairies between the Mississippi and Missouri, and live almost exclusively by the chase. On these prairies the buffalo is found in uncommon numbers, and probably there is no part of North America in which this animal is so plentiful. Hence the means of subsistence are very abundant, and the nation of the Dacotas is more numerous than any other in such high latitudes. It is stated that the Dacotas themselves compose a population of 28,000 individuals, and that there are above 7000 warriors. The Assiniboines, who live north of the Dacotas, within the territories of the Hudson's Bay Company, formerly constituted an integral portion of the Dacotas, but separated from them in consequence of a quarrel, whence they are named, by the Dacotas, Hoka (the revolted). The Chippewas name them Assiniboines or Stone Boines, and the Dacota they call Boines. This branch of the Dacota Indians is stated to be no less numerous than the Dacotas themselves.

The language of these two tribes differs from that of their neighbours, yet some distinctions of the nature of dialects appear to prevail in some words as spoken by the roving Indians and by the Dacotas. They believe in the existence of a Supreme Being, and a great number of subordinate beings, whose powers and attributes vary much. The Supreme Being is called Wahkan Tanka, or Great Spirit, and they consider him as the Creator of all things, and as the ruler and disposer of the universe; they hold him to be the source of all good and the cause of no evil. The next spirit in respect to power is the Wahkan Shecha, or Evil Spirit, whose influence is exclusively exerted in doing evil. The third divinity is the thunder, whose residence they fix in the west, and some believe that it dwells on the summit of the Rocky Mountains, because in this country all thunder-storms come from the west. The thunder is considered the spirit of war. They offer sacrifices to these three powers, and these sacrifices are accompanied with prayers, but not with dances.

To rise early, to be inured to fatigue, to hunt skilfully, to undergo hunger without repining, are the only points to which the Dacotas think it important to attend in the education of their children.

The Dacotas who live along the Mississippi and St. Peter's river raise maize, and they also cultivate beans, pumpkins, and other vegetables. But these agriculturists constitute only a small portion of the tribe: by far the larger part occupy themselves with hunting wild animals, especially the buffalo. The other animals which abound in their country are beavers, otters, martens, minxes, musk-rats, lynxes, wolverines, elks, moose deer, bears, and wolves. As the wild animals are so abundant in their country, the Dacotas are not obliged to live in small societies, but they generally live in camps consisting of eighty or a hundred lodges, each lodge containing several families. Sometimes there are above three hundred warriors in one encampment.

(Lewis and Clarke's *Travels up the Missouri, &c.*; and Keating's *Narrative of an Expedition to the Source of the St. Peter's River, &c., under the command of Major Long.*)

SIPHNO, called also *Siphanto* and *Sifanno* (by Carpacchi, *Isole del Mondo*), an island in the Archipelago, forming one of the group called the Cyclades. The original name was Merope; it was called Siphnus from a personage of that name. It was colonised by Ionians from Athens. (Herodot., viii. 48.) In the reign of Polycrates, the tyrant of Samos, about 520 B.C., the inhabitants were very flourishing in consequence of their gold and silver mines, and, according to Herodotus (iii. 57), they were the most wealthy of the islanders. They had a deposit at Delphi of the tenth of the produce of the mines. Some exiles, who were expelled from Samos by Polycrates [SAMOS], invaded Siphnus about this time, and levied a contribution of 100 talents. The Siphnians were among the few inhabitants of the Archipelago who resisted the Persian claim of earth and water, and they contributed one small ship of war at the battle of Salamis. (Herod., viii. 48.) Their mines were not afterwards so valuable (Demosthenes, *περι συντάξεως*). Pausanias (x., 11) says that after a time they ceased to send treasure to Delphi, and that in consequence the sea broke in on their mines and destroyed them. Siphnus is very little noticed by antient authors. From Stephanus Byzantinus, Hesychius, and Suidas we learn that the natives were of dissolute manners, insomuch that to do like a Siphnian (*Σιφνιάζειν*) was a term of reproach. In the work of Constantine Porphyrogennetus 'De Thematibus,' Siphnus is in the theme of Hellas, and in the Syuecdemus of Hierocles it forms part of the Provincia Insularum.

In the reign of Henry I., Latin emperor of Constantinople, Marco Sanado, the first duke of Naxos, conquered the island and made it part of his dominions. It passed from him into the hands of the Gozzadini family, who held it till it was wrested from them by Barbarossa, after the capture of Rhodes in the time of Soliman II. It was, in common with the neighbouring islands, partially protected from the oppressions of the Turks by the Venetians; and Tournefort (*Voyage du Levant*) mentions that about 50 years before his visit to the place, so little was the power of the Porte there, that the inhabitants, assisted by a Provençal corsair, expelled the Turks who had been sent there to work the lead-mines.

Siphnus is between 36° 50′ and 37′ 10′ N. lat., and in 25° 10′ E. long.: it is situated to the south-east of Serpho, north-east of Milo, and south-west of Paro, lying immediately opposite Antiparo. It is of an oblong form, narrower at the north than at the southern extremity. Pliny reckons it at about 28 Roman miles in circumference, and Carpacchi (Isole del Mondo) at 40. Tournefort mentions five ports, which were much frequented about 50 years before his visit there: Faro, Vathy, Kitriani, Kironisso, and Kastron, of which Kastron is on the east, Faro and Kitriani on the south, and Vathy on the west side. Another on the east side, Agia Sosti, is marked in the map attached to Fiedler's 'Reise durch Griechenland,' 1841. Tournefort gives the names of five villages, Artimone, Stavril, Catavati, Xambela, and Petali; and of four convents of caloyers, Brici or La Fontaine, Stomongoul, St. Chrysostome, and St. Hélie.

Fiedler mentions only two towns: Kastron, on a strong and rocky hill overlooking the sea, which is the residence of the governor; and Stawri, the Stavril of Tournefort, in the centre of the island. Siphnus is in the pashalik of Nakscha. The bishop is also bishop of Milo. The population in the time of Tournefort was about 5000; they were taxed in the year 1700 at 4000 crowns of French money. The lands are chiefly laid out in vineyards; the wine is not so good as that of the neighbouring islands. The chief trade is in silk, figs, honey, wax, sesame, and cotton stuffs, which are celetraded for their quality: the inhabitants import the raw material. There are very few sheep, horses, or horned cattle. The climate is good, and the inhabitants long-lived.

Siphnos was celebrated among the ancients for a sort of stone mentioned by Pliny (*Nat. Hist.*, xxxvi. 22), of which drinking-cups were made, which was easily carved, and hardened afterwards by boiling oil. This was a species of talc, according to Fiedler, who gives further particulars relating to the geology of the island. Tournefort was shown the situation of the gold-mine, but could not discover the entrance. Fiedler gives an account of one near Agia Sosti.

The antiquities of the island are few. On the south side, at Porto Pesi Gialo, are the remains of an old Greek town. Tournefort speaks of a temple sacred to Pan near the same, which is also noticed by Carpuchi, and of several marble sarcophagi with good sculptures. There are also Greek inscriptions, which are given by him and Fiedler. The Greek coins of Siphnos are very numerous; they are of gold, silver, and copper. The types on them are the head of Apollo (there was a town called Apollonia in Siphnos, according to Stephanus Byz., 'Ἀπολλωνία'), the Chimaera, head of Bacchus, and a dove with wings spread. The coins struck under the emperors have Pallas on the reverse. Kastron is a castle built apparently when the Venetians first occupied the island. Various buildings bear the arms of the Gozzadini family, three of whom were still living there in the time of Tournefort.

SIPHON (σίφων), a tube or pipe. This machine, which has been described in the article HYDRAULICS, was probably invented in the second century B.C., by Hero of Alexandria, who, in the 'Spiritalia, or Pneumatics,' mentions its employment for the purpose of conveying water from one valley to another over the intervening ground.

In order that a fluid may issue from that branch of a siphon which is on the exterior surface of the vessel containing it, it is necessary, as has been stated in the article above mentioned, that the extremity of the branch should be below the surface of the fluid in the vessel; but it may be observed that there is an exception to the rule when the interior diameter of that branch is very small: for example, when it is less than 1/10th of an inch, the interior diameter of the branch in the vessel being considerably greater. For if such a fluid as water or wine be introduced into a bent tube having one branch only very small, and the open ends be uppermost, the top of the fluid in the more slender branch will, by the effect of capillary attraction, stand higher than the top of that in the other branch. It would follow therefore, that if the bent tube were inverted, and the orifice of its larger branch were placed under the surface of the fluid in a vessel, the fluid would begin to issue from the other branch though the orifice of the latter were a little above the level of that surface.

The effect of a siphon may be produced by capillary attraction alone; for if a piece of cotton cloth have one of its extremities in a vessel of water, and part of it be made to hang over the edge of the vessel, the water will be attracted along the threads of the cloth, and will descend from thence in drops, provided the extremity of the part thus hanging over be below the surface of the water in the vessel.

The phenomena presented by springs of water are explained by supposing that the rain which is absorbed in the earth occasionally finds its way by small channels to some interior cavity, and from thence by other channels, which may be considered as natural siphons, to an orifice on a lower level at the surface of the ground. At this orifice it issues in a stream of water, which continues to flow till the surface of the water in the cavity has descended below the tops of the vertical bends in the channels: the water then ceases to flow till the rains again raise the water in the cavity above those bends. But it sometimes happens that a spring, without ceasing to flow, discharges periodically greater and smaller quantities of water in given times; and this is accounted for by supposing the existence of two cavities either unconnected or communicating with one another by small channels. The channels leading from one of these cavities to the point of efflux are supposed to be below the level of the water in both cavities, so that the water flows through them continually; but if the channels from the other have vertical bends, so that they act as siphons, and at the same time these channels carry off the water in them faster than it can flow into the first cavity in the ground, it will be only when the water in the latter cavity is above the level of all such bends that a discharge will take place from thence. As the water in that cavity may only attain the necessary height in consequence of periodical falls of rain, it will follow that corresponding increases in the total quantity of water discharged can only then take place.

For the amusement of young persons several philosophical toys have been constructed, in which the effects are produced by means of concealed siphons. The siphon is sometimes placed within a figure in the middle or on the edge of a cup, and sometimes between its exterior and interior sides. Such are Tantalus's Cup and the siphon fountain.

SIPHONA'RIA. [SEMIPHYLLIDIANS, vol. xxi., p. 218.]

SIPHONIA. [SIPHONIADÆ.]

SIPHO'NIA, a genus of plants of the natural family of Euphorbiaceæ, consisting of two species, but one may be only a variety of the other. This is celebrated as being the tree which yields the large quantities of caoutchouc, called *Cahuchu* by the native Americans, annually imported from Pará in South America. The *genus* has been named Siphonia, from the Greek word *siphon* (σίφων), a tube, from the purposes to which caoutchouc is applied; but it was originally called *Hevea* by Aublet, and the name was changed by Richard from its similarity to *Evea*. The species, or South American caoutchouc, was named *S. Cahuchu* from its Indian name Cahuchu. The same plant was first called *Jatropha elastica* by the younger Linnæus; so that it is known and referred to by three names, and in some works these are considered to indicate distinct plants. Aublet has figured the plant, and Jussieu the details of its inflorescence.

Siphonia elastica is a tree fifty to sixty feet in height, common in the forests of Guiana and Brazil, and which has been introduced into the West Indies. Condamine frequently mentions it in his voyage down the Amazon. Caoutchouc [CAOUTCHOUC] is the milky juice of the plant which exudes on incisions being made, and solidifies on exposure to the air. Aublet states that a deep incision is first made into the wood near the bottom of the tree, another is then made longitudinally from the upper parts of the tree down to the first lateral and oblique incision, others are also made along the stem, which terminate in the longitudinal one, and the milky juice which exudes from all is collected in a vessel placed at the original incision. He also states that the nuts are edible, and Mr. Murray says that a caterpillar, which spins a tough coarse kind of silk, feeds on the leaves.

SIPHONI'FERA, M. D'Orbigny's name for an order of testaceous Mollusks, consisting of the families *Spirulidæ*, *Nautilidæ*, *Ammonitidæ*, and *Peristellidæ*, according to the arrangement of M. Rang. The latter family comprises the genera *Ichthyosarcolites* and *Belemnites*.

SIPHONOBRANCHIA'TA, M. De Blainville's name for the first order of his first subclass of Mollusks, *Paracephalophora dioica*. He describes the *Siphonobranchiata* as possessing organs of respiration constantly formed of one or two pectiniform *branchiæ*, situated obliquely on the anterior part of the back, and contained in a cavity, the superior wall of which is provided with a tubiform canal more or less elongated and attached to the columella; and arranges under the order the following families:—SIPHONOSTOMATA; ENTOMOSTOMATA; and *Angyostomata*.

The *Angyostomata* are described as differing very little from the other families as far as the *animal* is concerned, and as possessing a very large subventral foot, which can be folded together longitudinally for the purpose of being withdrawn into the shell.

The aperture of the *shell* of the family is described as being more or less notched anteriorly, generally very narrow, but always much longer than it is wide, and the columella as being straight or nearly straight.

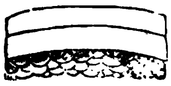
The *operculum* is rudimentary in a certain number of genera, and entirely null in others.

The *genera* arranged under the *Angyostomata* are *Strombus*, *Conus*, *Terebellum*, *Oliva*, *Ancillaria*, *Mitra*, *Voluta*, *Marginella*, *Peribolus*, *Cypræa*, and *Ovula*.

SIPHO'NOPS, Wagler's name for a genus of Cæciloidians.

The first suborder of the Batrachians, the *Péromèles* of MM. Duméril and Bibron, consists but of one family, the *Ophiosomes* (snake-bodied Batrachians) or *Cæciloïdiens*. Their round elongated form, without either tail or feet, approximates so closely to that of the serpents, that the greater number of authors have arranged them in the order Ophidians, acknowledging at the same time the anomalies which they present, and observing that they ought to form a very distinct group. [SERPENTS, vol. xxi., p. 281.]

The characters which lead to the classification of these reptiles into one family, and to their separation from all others, are, 1st, a body extremely extended in length, and of a cylindrical shape; 2nd, the absence of limbs or lateral appendages proper for locomotion; 3rd, a skin naked in appearance and viscous, but concealing between the circular folds which it forms many rows or rings of flat, delicate, imbricated scales, with free and rounded borders, resembling those of the greater part of the fishes; 4th, the rounded orifice of their cloaca situated below, very near the posterior extremity of the body, which is sometimes truncated, as it were, and rounded; sometimes obtusely pointed, as in the genus *Typhlops*; 5th, their head, as in all the Batrachians, is articulated to the spine by means of two distinct and separate condyles; 6th, their lower jaw moves upon the cranium without any separate articular bone, and the two branches which form it are short and very solidly soldered together towards the symphysis of the chin.



Scales of Cæcilia albiventris.

In the Serpents the occipital bone presents, below the vertebral hole, a single articular eminence, or condyle; and the structure and disposition of the jaws will be remembered by those who have referred to the article SERPENTS. The brevity of the jaws, and their construction in the Cæcilioïdians, reduce the aperture of their mouth to a very small diameter.

The bodies of the vertebræ of the Cæcilioïdians are doubly excavated into cones, instead of being concave before and convex behind. Their tongue is large, papillose, fixed by its borders upon the gums in the concavity of the jaw, and not protractile, nor forked, nor susceptible of entering into a sheath. The disposition and structure of their teeth are noticed in the article SERPENTS and more fully detailed in this.

Professor Owen observes that in the extinct family of the Labyrinthodonts [SALAMANDROIDES], the Batrachian type of organization was modified so as to lead directly from that order to the highest form of reptiles, viz. the loricate or crocodilian Saurians; that some of the existing edentulous genera of the *Bufonidæ* [FROGS] connect the Batrachian with the Chelonian order, and that the family founded upon the Linnean genus *Cæcilia* forms the transition to the ophidian reptiles. 'The characters,' says the Professor, 'which retain the *Cæciliæ* in the Batrachian order are generally known, and may be briefly enumerated as the double occipital condyle, the biconcave vertebræ, the smooth mucous integument with minute and concealed scales, and the branchial apertures retained by the young some time after their birth. In the fixed tympanic pedicle, and the anchylosed symphysis of the lower jaw, the *Cæciliæ* are also far removed from the typical ophidian structures; but the teeth, in their length, slenderness, sharp points, wide intervals, and diminished number, begin to exhibit the characters of the dental system of the serpent tribe.' (*Odontography.*)

The characters above set forth show the connection which these reptiles have with the Batrachians; but there is one striking feature, metamorphosis, which is not yet quite satisfactorily made out. Muller indeed states that he had observed young *Cæciliæ* whose neck was furnished with small branchial fringes, as will be hereafter more particularly noticed.

The departure in a degree of the *Cæcilioïdians* from the Batrachians is marked by the presence of small scales; by ribs which are forked at their vertebral extremity, and much more distinct than in the genus *Pleurodeles*; by the absence of a sternum; and especially by the form and structure of the mouth, the aperture of which is small, the lower jaw being shorter than the upper, and the teeth long, sharp, and generally curved backwards.

The *Cæcilioïdians* resemble many species of the osseous fishes of the division of the *Murænidæ* in the form and structure of the skeleton, the articulation of the jaws, the mode of implantation of the teeth, &c.; but the mode of junction of the head with the spine by means of two condyles, the presence of lungs and nostrils which open distinctly within the cavity of the mouth, and the entire absence of branchiæ, remove these animals from that class.

ORGANIZATION.

Skeleton.—The cranium presents above a single vaulted piece, in which no trace of orbits is perceptible. The lower jaw is not articulated with the skull by an intermediate bone, as in the birds, lizards, and serpents, but nearly as it is in the mammals, without however there being the slightest trace of a zygomatic bone. The branches of the lower jaw are joined anteriorly by a true suture, as in the lizards.

Professor Owen states that the teeth are implanted in a single row upon the maxillary, intermaxillary, and palatine bones, the upper jaw being thus provided with two semi-elliptical and sub-concentric series; that there are also two rows of equal-sized teeth on the premandibular bones of the lower jaw in certain species: the *Cæcilia*, he remarks, is the last example in the ascending survey which he has taken of the dental system of this disposition of teeth, which was so common in the class of fishes.

'There are,' writes the Professor, 'twenty teeth in the anterior or outer premandibular row in the lumbricoïd and white bellied *Cæciliæ*, and ten or twelve of much smaller size in the second row. There are twenty teeth in the outer row of the upper jaw, of which six are supported by the intermaxillaries, and sixteen in the inner or palatine row. All these teeth are long, slender, acute, and slightly recurved. In the rostrated *Cæcilia* the first two teeth of the maxillary and premandibular series are longer and stronger than the rest: they are succeeded by small and recurved teeth; the median margins of the palatal bones are bristled with small teeth; the second row in the lower jaw is represented by two small recurved teeth on the internal border of the premandibular bones. In the modification of the dental system presented by this species may be perceived a retention of the Batrachian type. The annulated Cæcilia (*Siphonops annulatus*) has the maxillary and palatine teeth strong, pointed, and slightly recurved. In the glutinous and two-banded *Cæciliæ* (*Epicrium*), the teeth are slender, acute, and more inclined backwards, thus approaching nearer to the ophidian type; in the latter species (*Epicrium —Rhinatrema—bivittatum*) the palatal series, instead o ranging concentrically with the outer row, is chevron-shaped with the angle turned forwards and rounded off. The teeth of the *Cæcilia* are sub-transparent; their intimate structure corresponds with that of the frog's tooth; but their mode of implantation resembles that of the teeth of the Labyrinthodonts, the base being anchylosed to the parietes of a shallow alveolus.' (*Odontography.*)

In the junction of the vertebræ there is an entire difference from that of the lizards and serpents, and a perfect approximation to that of the perennibranchiate batrachians and fishes. All the bodies of the vertebræ are hollowed, both before and behind, by tunnel-shaped cavities, in which ligamentous fibres are implanted; they are not really articulated, but placed one upon the other. Their superior spinous processes are like those of the *Amphisbænæ* and those in the neck of birds, in other words, depressed so as to present only a slight *carina*. Each body of a vertebra is furnished below with an apophysis curved backwards, and forked forwards for the reception of the eminence of the preceding vertebra. On the sides is seen a small projection, on which one of the bifurcations of the rib is applied, for the other and longer fork rests upon an inferior eminence. The ribs are short, straight, directed backwards, and triangular, forked as in the birds, and united to the vertebræ very nearly in the same manner.

Respiratory System.—In *Cæcilia lumbricoïdea* the rudiment of a lung only has been observed; and Meyer, who made this observation, and recognised also scales under the folds of the skin, conceives that these animals are species between the two orders of reptiles which he indicates under the name of *Ophisaurians* on account of the existence of the ribs and the presence of the single lung. Müller announced the existence of branchial holes in a young *Cæcilia* (*hypocyanea*) preserved in the Museum of Natural History at Leyden. He noticed an aperture of the size of a line on each side of the neck, at some lines' distance from the extremity of the buccal slit. This aperture was much wider than it was deep, situated in the yellow stripe which exists on the sides. The edge of the hole was rough (âpre), and in the interior were observed black fringes, which appeared to be fixed to the horns of the os hyoides, or branchial arcs; but they did not pass beyond the external orifices. The lobes themselves are in free communication with the buccal cavity. It must be remembered that this observation was made without dissection. The specimen is four inches and a half in length, whilst an adult individual, which showed no trace of holes, was more than a foot long.

Generation.—Mayer thinks that he observed two intromittent organs in the *Cœciliæ*. See further the remarks at the end of this article.

SYSTEMATIC ARRANGEMENT.

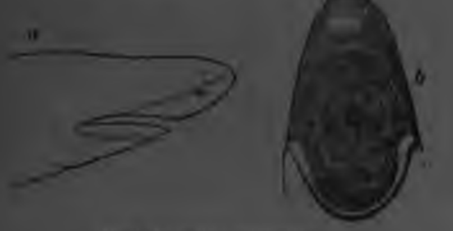
The position assigned to the Cœciliidians will be found in the articles REPTILES and SERPENTS. We will only here add that Müller proposes for them the name of *Gymnophiona*, the first order of naked amphibians. The second order consists of the *Derotremes*, the third of the *Proteideans*, the fourth of the *Salamandrines*, and the fifth of the *Batrachians*. Tschudi arranges the *Cœciliidians* between the Pipas and Salamanders, adopting the three genera of Wagler, who placed them between the *Amphisbænæ* and the *Batrachians*.

Geographical Distribution of the Suborder.—America, Asia, and Africa.

Genera.—*Cœcilia, Siphonops, Epicrium, Rhinatrema.*

Cœcilia.

Generic Character.—*Head* cylindrical; muzzle projecting. Maxillary and palatine teeth short, strong, conical, and slightly curved. *Tongue* velvety or villous, most frequently offering two hemispherical convexities corresponding to the internal orifices of the nostrils. Eyes distinct or not distinct through the skin. A fosset or false nostril below each nostril. (D. and B.)



Head of Cœcilia lumbricoidea.

a, seen in profile; b, mouth open, to show the tongue, the teeth, and the internal orifices of the nostrils. (Dum. and Bibr.)

Geographical Distribution of the Genus.—Of the four species, one is Asiatic, one African, and two American.

Example, *Cœcilia lumbricoidea.*

Description.—The longest and most slender of the whole family, its length being more than ninety times the diameter of its body measured towards the middle. MM. Duméril and Bibron state that individuals fifty-three centimetres long have the thickness of a stout goose-quill; cylindrical; the body however being rather smaller in its last part than its first, excepting at the extremity, where it is always a little convex. The muzzle is wide and rounded; the maxillary and palatine teeth are rather long, sharp, a little conic backwards, and separated from each other. The tongue adheres in all parts to the concavity formed by the submaxillary branches; its surface exhibits small vermiculiform folds and furrows, and there are two hemispherical convexities, corresponding to the internal orifices of the nostrils, which are great and oval. The external nostrils are two very small holes situated on each side of the end of the muzzle, under which are seen two very small apertures, upon a portion of the border of each of which there seems to be a small tentacle. MM. Duméril and Bibron were unable to perceive the eyes through the skin, which is perfectly smooth over the whole head; that which envelopes the body is scarcely marked with circular folds, except at the posterior extremity, that is to say, at about the twenty-seventh of the length of the body, where there are from twelve to fifteen. When these folds are raised, large but delicate scales are discovered, bearing much resemblance to those of the carp, forming one or two verticillations, in the composition of which they show themselves to be very distinctly imbricated. The vent is situated under the terminal extremity of the body, which is rounded. The colour is of a brownish or olive tint.

Locality.—Surinam.

Siphonops. (Wagler.)

Generic Character.—*Head* and *body* cylindrical; muzzle short; maxillary and palatine teeth strong, pointed, and a little *recurved*; tongue large, entire, adhering on all sides, with a surface hollowed into small vermiculiform sinkings. Eyes distinct through the skin. A *fosset* or false nostril in front of and a little below each eye.

MM. Duméril and Bibron remark that the species of this genus generally have the muzzle shorter than the *Cœciliæ*, which gives their mouth the air of opening less under the head. The fossets or false nostrils are placed not under the muzzle, but under the eyes, a little more or less forward. The skin which covers the eye is sufficiently transparent to enable the observer to see that organ through. The border of their nostrils and false nostrils are without the least rudiment of a tentacle. Their teeth resemble those of the *Cœciliæ*; but their tongue, whose surface is furrowed with small vermiculiform sinkings, has no hemispherical protuberances.

Geographical Distribution of the Genus.—Two species only are known, both American.

Example, *Siphonops annulatus* (*Cœcilia annulata*, Auct.).

Description.—Muzzle very short, very thick, very much rounded, hardly less than the back of the head. Nostrils opening on the sides of the muzzle, entirely at the end, and a little upward. False nostrils placed below each eye, and very slightly forward. Diameter of the body a sixteenth or seventeenth of its total length: it is rather strong, and perfectly cylindrical; of the same size throughout its extent. There are from eighty-six to ninety annular folds, slightly and equally separated from each other; these cease a little in front of the vent, so that the skin of the terminal extremity of the body, which is rounded, offers no wrinkles.

MM. Duméril and Bibron state that in no individual could they discover scales in the thickness of the skin, where they probably exist, as in the other *Cœciliæ*, but doubtless much smaller and more difficult of exposure, on account of the extremely close tissue, which renders it as it were cartilaginous. Colour olive or bluish-ash, but, in all, the circular folds have a white tint.

Locality.—Cayenne and Surinam.

1. Siphonops annulatus very much reduced. a, head and neck seen in profile; b, mouth open, to show the tongue, the teeth, and the internal orifices of the nostrils; c, terminal extremity of its body seen below. (Dum. and Bibr.)

Epicrium. (Wagler. *Ichthyophis*, Fitzing.)

Generic Character.—*Head* depressed, elongated; *muzzle* obtuse; maxillary and palatine teeth of loose texture (sillées), sharp, and couched backwards. *Tongue* entire, with a velvety surface; eyes distinct through the skin, a fosset (with a tentaculated border?) below the eye, near the border of the upper lip. *Body* subfusiform, with numerous circular folds close-set one against the other. (Dum. and Bibr.)

Example, *Epicrium glutinosum*; *Cœcilia glutinosa*, Linn.; the only species known.

Description.—The diameter of the body taken near the middle is the twenty-second or twenty-third part of the total length. There are about three hundred and twenty-five folds, rather uniformly approximated. Those which occupy the two first thirds of the length of the trunk do not completely surround it, that is to say, they do not descend so as to meet under the belly. These same folds of the two first thirds of the length of the trunk are remarkable for breaking on a point of their circumference, so as to form, each of them, a very open chevron, the summit of which, directed forwards, is found placed on the medio-longitudinal line of the back. The other folds of the body, those, namely, which surround the last third of it, form complete rings. The scales which these folds hide are small, numerous, delicate, transparent, subcircular, and offering on their superior surface a small figure in relief, representing a net with quadrilateral meshes. A yellowish band extends to the right and left all along the body, from the muzzle to the anal extremity: above and below the tint is slate-colour.

Locality.—Java and Ceylon.

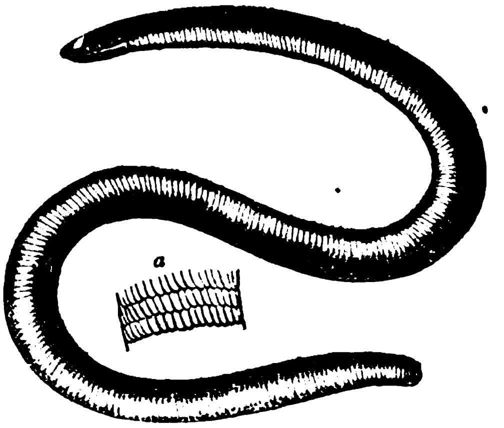
Rhinatrema. (Dum. and Bibr.)

Generic Character.—*Head* depressed, elongated; muzzle obtuse; maxillary and palatine teeth of loose structure (effilées), sharp, and couched backwards. *Tongue* entire, of a velvety surface. *Eyes* distinct through the skin. No fossets, neither under the muzzle nor below the eyes. *Body* subfusiform, with numerous circular folds.

Example, *Rhinatrema bivittatum; Cæcilia bivittata*, Auct.: the only species.

Description.—Head a little elongated and slightly depressed, bearing some resemblance in form to that of certain Ophidians, particularly of the *Coronellæ*. The teeth very loosely constructed (effilées), and very much couched backwards; the second row above, instead of forming a curved line like the first, makes an angle rounded at its summit. The diameter of the middle of the trunk is one twenty-sixth of the total length of the body, round which there are three hundred and forty perfectly annuliform folds. There exists a small conical tail. The folds of the skin may be easily raised by a point; and a great number of circular transparent scales, with a surface relieved by projecting lines, forming a sort of net. There is a large yellow band on each side of the body; the submaxillary branches, whose border is brown, are of the colour of the lateral bands, as well as the margin of the cloaca, and a small longitudinal stripe upon the tail.

Locality.—Cayenne?



Rhinatrema bivittatum. *a*, its scales.

MM. Duméril and Bibron terminate their account of the *Cæciliæ* with the following information.

M Leperieur, during his stay at Cayenne, having procured a living *Cæcilia*, which he placed in a vessel filled with water, he saw it bring forth, in the space of some days, from five to seven young, perfectly similar to their mother. Upon this MM. Duméril and Bibron observe that the *Cæciliæ*, in spite of their bearing a greater resemblance to the Batrachians than to the other reptiles, must be ovoviviparous. The fecundation of their germs must be effected in the interior of their body; and their metamorphoses must take place in the body of their mother, as in the case of the Black Salamander of the Alps. [Cæcilians.]

SIPHONOSTO'MATA, M. de Blainville's name for his first family of Siphonobranchiata.

The forms comprised under this family are principally to be found under the extensive genus *Murex* of Linnæus. All the known animals belonging to it are carnivorous and marine, and all are furnished with a horny operculum. The *Siphonostomata* are thus subdivided by M. de Blainville:—

* No persistent *bourrelet* on the right lip.

Pleurotoma. (Lam.)

Generic Character.—*Animal?*

Shell fusiform, slightly rugose, with a turriculated spire; aperture oval, small, terminated by a straight canal more or less long. The right lip trenchant and more or less incised.

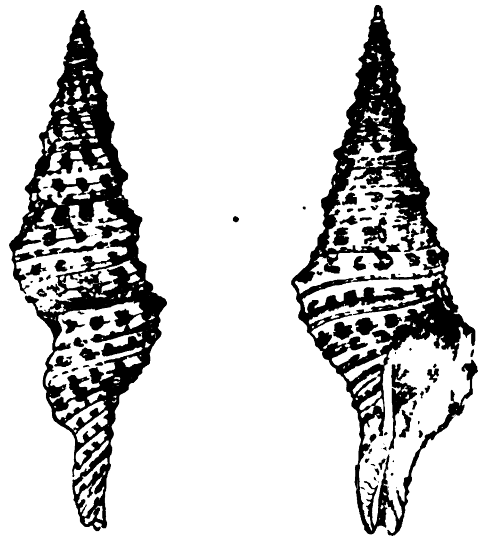
Operculum horny.

A. Species in which the incision is a little behind the middle of the lip, and the tube of considerable length.

Example, *Pleurotoma Babylonia.*

Description.—The shell fusiform-turreted, transversely carinated and belted, white, with black-spotted belts, the spots quadrate; whorls convex; tube or canal rather long.

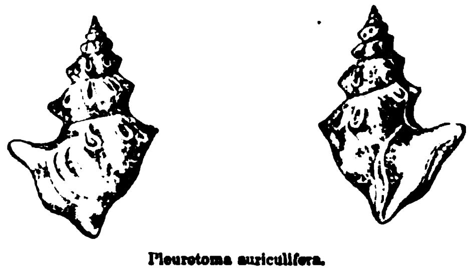
Locality.—The East Indian Seas and the Moluccas.



Pleurotoma Babylonia.

B. Species in which the incision is entirely against the spire, and whose tube is short. (Genus *Clavatula*, Lam.)

Example, *Pleurotoma auriculifera.*



Pleurotoma auriculifera.

This genus has been taken on different bottoms at depths varying from eight to sixteen fathoms.

Lamarck characterises 23 living species of *Pleurotoma*, and 30 fossil, the latter mostly from Grignon. Defrance makes the number of fossil species 95.

Mr. G. B. Sowerby has described in addition 36 living species collected by Mr. Cuming, M. Deshayes one, and Dr. Turton one. (*Synopsis Testaceorum*; *Zool. Proc.*, &c.) M. Deshayes in his tables makes the number of living species 71, and the number of fossil (tertiary) 150. Of these he records *Pl. Cordieri*, *Caumarmondi*, *Vulpecula*, *craticulata*, and a new species as both living and fossil (tertiary). In Europe the principal localities for the fossils are the calcaire grossier, the London clay, the contemporary beds near Bordeaux, and the Subapennine beds. Dr. Mantell notes an imperfect *Pleurotoma* in the blue clay of Bracklesham. Mr. Lea has described and figured eleven fossil species from the new tertiary at Claiborne, Alabama. Professor Sedgwick and Mr. Murchison notice three species, *prisca* (?), *fusiformis*, and *spinosa*, from the Gosau deposit and its equivalents in the Alps; and Mr. Murchison records two species, *Pleurotoma articulata* and *Pl. corallii*, in the Silurian rocks. (*Silurian System.*)

Rostellaria. (Lam.)

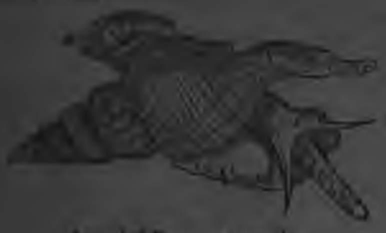
This genus, in our opinion, belongs to the Strombidæ, under which article it will be described.

Fusus. (Lam.)

Generic Character.—*Animal* not differing much from that of *Murex*.

Shell fusiform, often ventricose in the middle, rugose, thick, and with a very elevated spire; canal very straight and elongated; aperture oval; right lip trenchant, the left smooth.

Operculum horny.



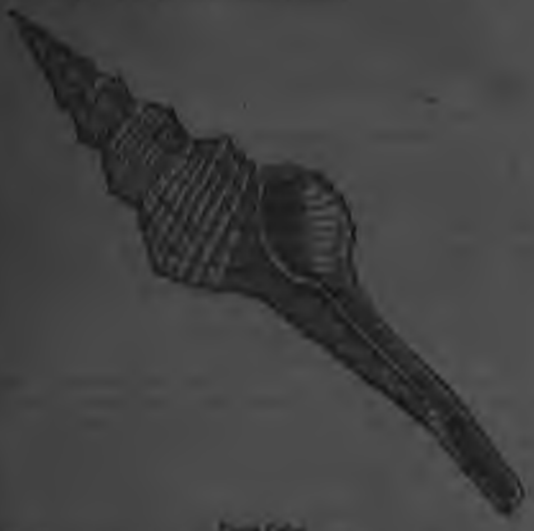
Animal of Fusus. *a*, operculum.

A. Turriculate or subturriculate, but not umbilicated species.

Example, *Fusus Colus* (*Murex Colus*, Linn.).

Description.—Shell fusiform, narrow, transversely furrowed, white, the apex and base rufous; whorls convex, carinated in the middle; canal long and slender; the lip sulcated within, and denticulate at the margin.

Locality.—The East Indian Ocean.



Fusus Colus.

B. Species subturriculated and umbilicated. (Genus *Latirus*, De Montf.)

Example, *Fusus filosus*.

Description.—Shell fusiform-turreted, thick, knotty, but smooth to the touch, whitish yellow girt with numerous brown-red lines; whorls knotty above, the knots hemispherical; the aperture white; the lip striated within.

Locality.—The seas of New Holland.

C. Subturriculate species, with the canal notched at the extremity.

Example, *Fusus articulatus*.

Description.—Shell fusiform turreted, very delicately striated transversely, shining, saffron-coloured or violaceous-ferruginous, girt with articulated bay lines; lip sulcated within; columella with one plait above; canal short and emarginate.

D. Species with the whorls of the spire rounded and convex.

Example, *Fusus Islandicus*.

Description.—Shell fusiform-turreted, ventricose below, not knotted, transversely striated, white; the whorls convex; the lip thin, smooth within; the canal rather short and subrecurved.

Locality.—The seas of Iceland.

E. Dextral species.

Example, *Fusus antiquus*.

F. Sinistral species.

Example, *Fusus contrarius*.

Fusi have been found on bottoms of mud, sandy mud, and sand, at depths ranging from the surface to eleven fathoms.

Lamarck records 37 living species of *Fusus* and 45 fossil, nearly all from France, and principally from Grignon. Defrance makes the number of the latter 78, four of which are analogues from Grignon, and one from the Plaisantin.

M. Deshayes in his tables gives sixty-seven as the number of living species of *Fusus*, and 111 as that of the fossil species (tertiary); of these he records *Fusi articulatus, costulatus, strigosus, lignarius, sinistrorsus, Turonicus, antiquus, brevicauda, carinatus, despectus*, and *Pyrenaicus*, both living and fossil (tertiary). Dr. Mantell notes one species (*longævus*) from the blue clay at Bracklesham. Professor Sedgwick and Mr. Murchison enumerate six species from the Gosau deposit and its equivalents in the Alps. Dr. Fitton notes *Fusi* [illegible], *quadratus, rigidus, rusticus*, and an indefinite species in the strata below the chalk. (*Observations on the Strata between the Chalk and Oolite*, &c., in *Geol. Trans.*, 2nd series, vol. iv.) Mr. Lea records sixteen new species from the tertiary beds at Claiborne, Alabama, and one from Maryland. (*Contributions to Geology.*)

Pyrula. (Lam.)

Generic Character.

Shell pyriform, in consequence of the lowness of the spire; the canal conical and very long or moderate, sometimes slightly notched; aperture oval, rather large; columella smooth and bent; right lip trenchant.

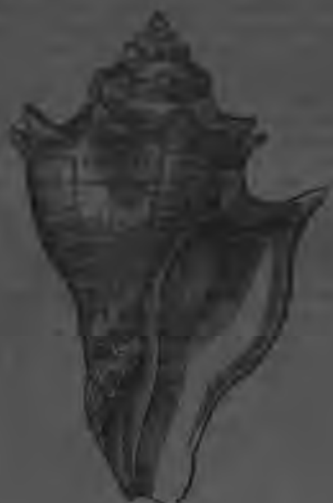
Operculum horny.

A. Subfusiform species; the spire being slightly elevated.

Example, *Pyrula ternatana*. (*Pyrula Vespertilio*, Lam.; *Fusus ternatanus*, Mart.; *Murex Vespertilio*, Gm.)

Description.—Shell subpyriform, thick, ponderous, muricated anteriorly, of a rufous-bay colour; the last whorl crowned above with compressed tubercles; spire rather prominent; the sutures simple; canal sulcated and subumbilicated.

Locality.—East Indian Ocean.



Pyrula ternatana.

B. Species with a long and rather narrow tube; spire very short.

Example, *Pyrula Spirillus*.

Description.—Shell ventricose anteriorly, the canal very long, delicately striated transversely, white, spotted with saffron-colour; body-whorl abbreviated, carinated in the middle, flattened above, tuberculated below the middle; spire very much depressed, its apex mamilliform.

Locality.—East Indian Ocean. Coasts of Tranquebar.

C. Species with a long and rather narrow tube, but sinistrorsal or left-handed, and with the indication of a plait on the columella or pillar. (Genus *Fulgur*, De Montf.)

Example, *Pyrula perversa*.

Description.—Shell sinistrorsal, pyriform, very ventricose, smooth, yellowish-white, ornamented with broad rufo-fuscous longitudinal lines; the last whorl crowned above with tubercles; the upper whorls tuberculiferous at the base; the canal or tube rather long and striated.

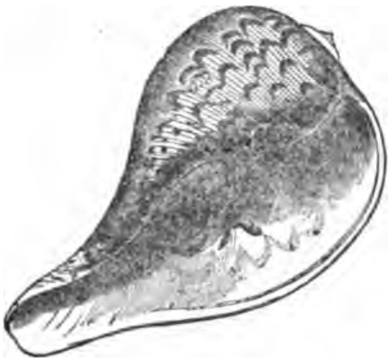
Locality.—The Antilles. Bay of Campeachy.

D. Species more ventricose and delicate.

Example, *Pyrula Ficus*.

Description.—Shell fig-shaped, delicately decussated, cœrulescent-grey; sprinkled with variegated bay or violet spots; transverse striæ the largest and most crowded; the spire short, convex, mucronated at the centre; mouth cœrulescent-violaceous generally.

Locality.—The East Indian Ocean. The Moluccas.



Pyrula Ficus.

E. Ventricose species, with a short tube; aperture very large and wide, sensibly notched.

Example, *Pyrula Melongena*.

Description.—Shell pyriform, turgidly ventricose, cœrulescent, glaucous, or rufous, banded with white; the whorls channelled at the sutures; the last sometimes unarmed, but more frequently muricated, with various sharp tubercles; spire short, acute; aperture smooth and white.

Locality.—West Indian Seas; Antilles.

F. Species still shorter; aperture very wide; the right lip subalated.

Example, *Pyrula abbreviata*.

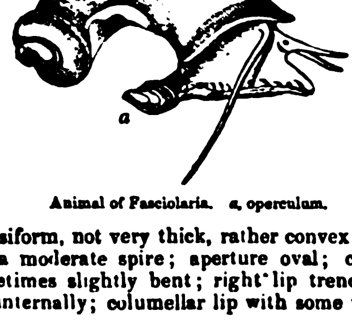
Description.—Shell subpyriform, very ventricose, rather rough, transversely sulcated, cinerescent-white; the spire rather prominent; the canal short, widely umbilicated; muriculated on the back with subechinate elevated furrows; outer lip striated within, and its margin denticulated.

Pyrulæ have been found on mud, sandy mud, and sand, at depths ranging from the surface to nine fathoms.

The number of living species recorded by Lamarck is twenty-eight. M. Deshayes has described one more (*P. fulva*), and a variety of *P. Vespertilio*, Lam. Lamarck records six fossil species, four from Grignon and Courtagnon, one from Parnes, and one from Houdan. Defrance notices twelve, three of which, from the Plaisantin, he considers as analogous, and other three from the neighbourhood of Bordeaux, analogues also. M. Deshayes, in his tables, makes the number of living *Pyrulæ* thirty-one, and the number of fossil (tertiary) twenty-one; of these last he indicates *Pyrulæ reticulata, Ficus, Melongena*, and *Spirillus*, as being found both living and fossil (tertiary). Dr. Mantell records two species, *bulbiformis ?* and *lævigata*, from the blue clay of Bracklesham in Sussex, and one from the arenaceous limestone of Bognor. Dr. Fitton records three, *Brightii, depressa*, and *Smithii ?*, from the strata below the chalk (gault of Kent). Mr. Lea records three, *Pyrulæ cancellata, elegantissima*, and *Smithii*, from the tertiary beds at Claiborne, Alabama.

Fasciolaria. (Lam.)

Generic Character.



Animal of Fasciolaria. a, operculum.

Shell fusiform, not very thick, rather convex in the middle, with a moderate spire; aperture oval; canal rather long, sometimes slightly bent; right lip trenchant, often wrinkled internally; columellar lip with some very oblique plaits.

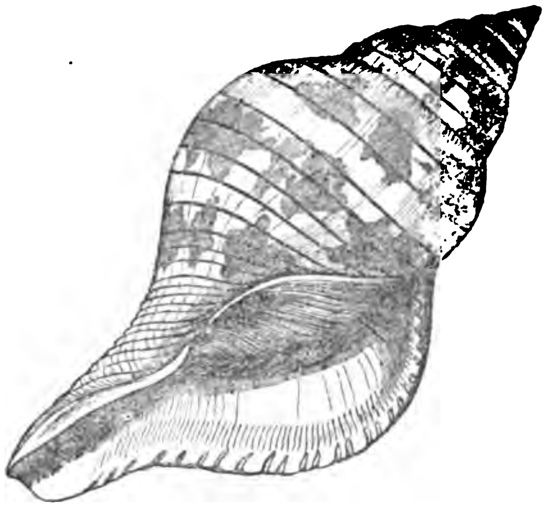
Operculum horny.

A. Fusiform, but not tuberculous species.

Example, *Fasciolaria Tulipa*.

Description.—Shell fusiform, ventricose in the middle, unarmed, smooth, sometimes orange-rufous, sometimes marbled with white and bay, girt with transverse brown lines unequally congregated; whorls very convex; sutures fimbriated at the margin; tube sulcated; outer lip white and striated within.

Locality.—West Indian Seas; the Antilles.



Fasciolaria Tulipa, with the operculum in situ.

B. Fusiform and tuberculous species.

Example, *Fasciolaria Trapezium*.

Description.—Shell fusiform, ventricose, tuberculiferous, rather smooth, white or rufescent, girt with rufous lines; the tubercles conical, subcompressed, and in a single series in the middle of the whorls; columella reddish-yellow; outer lip elegantly striated within, the striæ red.

Locality.—The East Indian Ocean.

C. Tuberculated and turriculated species.

Example, *Fasciolaria filamentosa*.

Description.—Shell elongated, fusiform, turreted, transversely sulcated, white, painted with longitudinal orange-red stripes; middle of the whorls subangulated, and the whorls themselves crowned with short and compressed tubercles; the canal rather long; the outer lip striated within.

Locality.—The East Indian Seas.

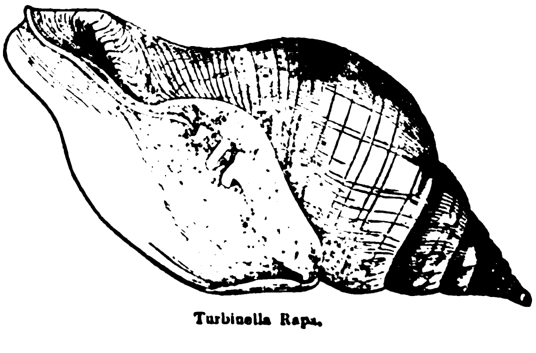
Fasciolariæ have been found on muddy bottoms, at depths ranging from the surface to seven fathoms.

Lamarck records eight living species. Mr. Broderip has described one (*granosa*) brought by Mr. Cuming from Panama. M. de Blainville states that seven fossil species are known. M. Deshayes, in his tables, makes the number of living *Fasciolariæ* seven only, and the number of fossil (tertiary) species five. Professor Sedgwick and Mr. Murchison record one species (*Fasciolaria elongata*) in the Gosau deposit and its equivalents in the Eastern Alps. Mr. Lea notices two, *Fasciolariæ plicata* and *elevata*, in the Claiborne tertiary, Alabama.

Turbinella. (Lam.)

Generic Character.—*Animal* imperfectly known.

Shell ordinarily turbinated, but also sometimes turriculated, rugous, thick; spire rather variable in form; aperture elongated, terminated by a straight canal, often sufficiently



Turbinella Rapa.

short; the left lip nearly straight and formed by a callosity laying the columella, which has two or three unequal, nearly transverse plaits; right lip entire and trenchant.

A. Fusiform and nearly smooth species.

Example, *Turbinella Rapa.*

Description.—Shell subfusiform, ventricose in the middle, thick, very ponderous, unarmed, white; the whorls above exceeding the base of the preceding one; canal rather short; columella subquadriplicated.

Locality.—The East Indian Ocean.

B. Tuberculous and spiny species.

Example, *Turbinella Scolymus.*

Description.—Shell subfusiform, ventricose in the middle, tuberculated, pale yellow; spire conical, tuberculato-nodulose; the last whorl crowned above with great tubercles; canal transversely sulcated; the columella orange-coloured and three-plaited.

Locality.—The East Indian Ocean.

C. Long-canaliculated, subfusiform species.

Example, *Turbinella Infundibulum.*

Description.—Shell fusiform-turreted, narrow, many-ribbed, transversely sulcated, the ribs longitudinal and dark, the furrows smooth and red, and the interstices yellow; canal perforated, the aperture white.

Turbinellæ have been found on bottoms of sandy mud, at depths varying from the surface to eighteen fathoms.

Lamarck records 24 living species, all from the seas of warm climates. Mr. Broderip describes three more brought by Mr. Cuming from the Galapagos Islands, Elizabeth Island, and the Caracas. M. de Blainville observes that when he wrote (1825) no fossils had been found. M. Rang (1829) states that there are fossil species. M. Deshayes, in his tables, makes the number of living species 32 and the number of fossil (tertiary) 3.

** A persistent *bourrelet* on the right lip.

Columbella. (Lam.)

Generic Character.—*Animal* incompletely known.

Shell thick, turbinated, with a short obtuse spire; aperture narrow, elongated, terminated by a very short canal slightly notched, narrowed by a convexity at the internal side of the right lip and the plaits of the columella.

Operculum horny, very small.

Example, *Columbella mercatoria.*

Description.—Shell ovato-turbinated, transversely sulcated, white, painted with small, rufo-fuscous, transverse, subfasciculated lines, sometimes banded; outer lip denticulated within.

Locality.—The Atlantic Ocean.

Columbella mercatoria.

Columbellæ have been found on bottoms of sandy mud and mud at depths ranging from the surface to sixteen fathoms.

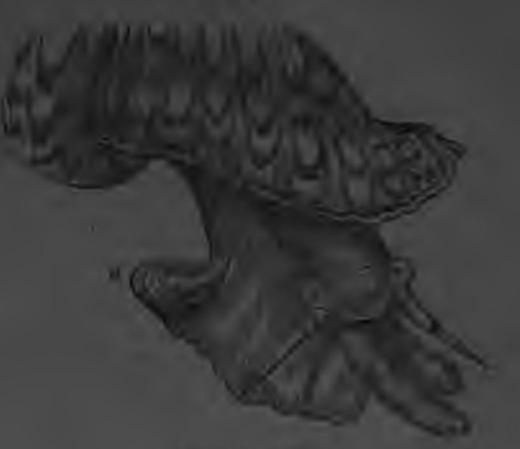
Lamarck describes eighteen species, all from the seas of warm climates. M. de Blainville acknowledges that this genus would perhaps be better placed among the operculated *Angyostomata*, or narrow-mouthed testaceous gastropods. M. Rang however arranges it between *Triton* and *Turbinella*. Mr. G. B. Sowerby has described thirty-nine additional species brought home by Mr. Cuming. Defrance notices one fossil species. M. Deshayes, in his tables, makes the number of living species thirty-three and of fossil (tertiary) four. M. de Blainville remarks that the *Columbella mercatoria* of Gray has not the character of the thickened right lip.

Triton. (Lam.)

Generic Character.—*Animal* a good deal resembling that of *Murex*.

Shell oval, with the spire and canal straight and moderate; exteriorly rugose, furnished with few varices, which are scattered and arranged longitudinally; aperture suboval, elongated, terminated by a short open canal; the columellar lip less excavated than the right, and covered by a callosity.

Operculum horny and inclined to oval.



Animal of Triton.

a, operculum.

A. Comparatively smooth species, with varices slightly or not at all marked, with the exception of that of the right lip.

Example, *Triton variegatus*, the marine trumpet or Triton's shell.

Description.—Shell elongated-conical, trumpet-shaped, ventricose below, girt with very obtuse smooth ribs, white, elegantly variegated with red and bay; the sutures crisped at the margin; the aperture red; the columella wrinkled with white and with a single plait above; the edge of the outer lip spotted with black, the spots bidentated with white.

Locality.—The seas of the West Indies and the Asiatic seas, especially those of the torrid zone.

Triton Variegatus.

B. Species more tuberculous, or spiny, whose aperture is more open, and terminated by a more or less ascending canal. (Genus *Lotorium* of De Montfort.)

Example, *Triton Lotorium.*

Description.—Shell fusiform-turreted, distorted below, very much tuberculated, transversely rugose, and striated, rufous; the whorls above angulate-tuberculated; canal tortuous, the extremity recurved, the aperture trigono-elongated and white; the outer lip toothed within.

Locality.—East Indian Ocean.

C. Species with a shorter spire, always very tuberculous, most frequently umbilicated, a sinus at the posterior junction of the two lips. (Genus *Aquillus*, De Montfort.)

Example, *Triton cutaceus*.

Description.—Shell ovate, ventricose-depressed, cingulated, tuberculato-nodose, yellow-rufescent; the belts rather prominent, separated by a furrow; the whorls above angulato-tuberculate, rather flattened above; canal short, umbilicated; the outer lip notched within.

Locality.—The Atlantic Ocean.

D. Species like those of section C, but whose aperture is closely narrowed by a callosity and irregular teeth. (Genus *Persona*, De Montf.)

Example, *Triton Anus*, the Grimace of collectors.

Description.—Shell ovate, ventricose-gibbous, distorted, flattened beneath; nodulous above, subcancellated, white, spotted with rufous; the aperture narrowed, sinuous, irregular, ringent; the lip very much toothed; the canal short and recurved.

Locality.—The East Indian Seas.

Tritons have been found on various bottoms at depths ranging from the surface to thirty fathoms.

The number of living species recorded by Lamarck amounts to fifty-one. Mr. G. B. Sowerby has described eight additional species, and Mr. Broderip the same number brought home by Mr. Cuming. Lamarck describes three fossil species, all from Grignon. M. de Blainville states that one of the species has its analogue. Defrance makes the number of fossil species ten, one from the Plaisantin, an analogue according to Brocchi. M. Deshayes in his tables, published before the descriptions of Mr. Sowerby and Mr. Broderip, makes the number of living species of *Triton* 43 and of fossil (tertiary) 25. Of these last, he records *Tritones nodiferus, Lampas, Scrobiculator, succinctus, clathratus*, and *unifilosus* as both living and fossil (tertiary).

Struthiolaria. (Lam.)

Generic Character.

Shell oval, the spire elevated, the aperture oval and wide; canal very short, very much notched; right lip sinuous, not toothed, furnished with a bourrelet; columellar border callous, extended; a sinus at the posterior union of the two lips.

Operculum horny.

Example, *Struthiolaria nodulosa*.

Description.—Shell ovate-conical, thick, transversely striated, white, painted with undulated, longitudinal, saffron-coloured flame-like lines; whorls angulated above, flattened on the upper side, nodulous at the angle; the sutures simple, the outer lip luteo-rufescent within.

Locality.—The seas of New Zealand.

Lamarck records two living species. M. Deshayes, in his tables, also makes the number of living species two; and he records one fossil (tertiary), with a query, from Paris.

Ranella. (Lam.)

Generic Character.

Shell oval or oblong, depressed, having only two varices situated laterally; aperture oval; canal short, and a sinus at the union of the two lips, backwards.

A. Non-umbilicated species. (Genus *Bufo*, De Montf.)

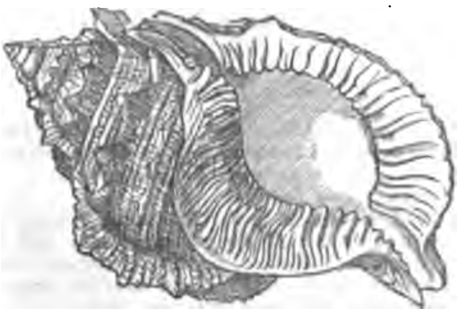
Example, *Ranella granulata*.

Description.—Shell ovate-acute, girt with close-set granulated striæ, pale saffron colour, zoned with fulvous; columella sulcated; outer lip thick and toothed.

Locality.—The East Indian Ocean.

B. Umbilicated species.

Example, *Ranella foliata*.



Ranella foliata.

Description.—Shell ovate-conical, ventricose, not compressed, of a flesh or pale rose-colour; with frequent transverse, subgranulated, low ridges, the interstices between which are longitudinally striated; the whorls armed with one row of sharp tubercles, the middle of which are the longest, the other ridges of the body whorl obsoletely tuberculated here and there; the columellar lip expansive and foliated, and the margin of the outer lip expanded and thin; the aperture ovate, very strongly and thickly furrowed, of a rich orange-colour, and terminating above in a deep foliated sinus, which extends beyond the varix. (Brod.)

Locality.—The Mauritius.

Ranellæ have been taken on different bottoms at depths varying from the surface to eleven fathoms.

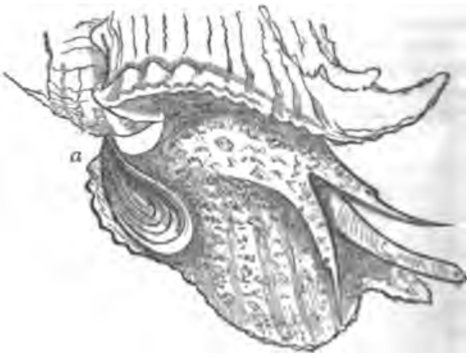
Lamarck describes fifteen living species. M. Deshayes has described another; and Mr. Broderip nine new species, eight of which were brought home by Mr. Cuming. M. de Blainville states that there is but one fossil species, but allows that Defrance admits five, three of which, from Italy, are identical. M. Deshayes, in his tables, gives the number of living species as nineteen, and of fossil (tertiary) as eight: of these last he records *Ranellæ gigantea, granulata, pygmæa*, and *tuberosa*, as living and fossil (tertiary).

Murex. (Linn.)

Generic Character.—*Animal* furnished with two long and approximated tentacles; mouth without jaws, but armed with hooked denticles in lieu of a tongue; foot rounded, generally rather short; mantle large, often ornamented with fringes on the right side only; branchiæ formed of two unequal pectinations; anus on the right side in the branchial cavity; orifice of the oviduct on the right side at the entrance of the same cavity; orifice of the deferent canal at the end of the exciting organ, on the right side of the neck.

Shell.—Oval, oblong, more or less elevated on the spiral side, or prolonged forwards; external surface always interrupted by rows of varices in the form of spires or ramifications, or simply tubercles, generally arranged in regular and constant order; aperture oval, terminated anteriorly by a straight canal, which is more or less elongated and closed; right lip often plaited or wrinkled; columellar lip often callous.

Operculum horny.



Animal of Murex.
a, operculum.

A. Species with a very long and spiny tube. (*Thorny Woodcocks* of collectors.)

Example., *Murex Tribulus*, Linn. (*Murex tenuispina*, Lam.)

Description.—Shell ventricose anteriorly, the tube very long, elegantly spired throughout its length, the spires set in triple order, each row at regular intervals, greyish or purplish grey; the spires very long, thin, rather closely set and somewhat hooked; body of the shell transversely sulcated and striated; the spire prominent.

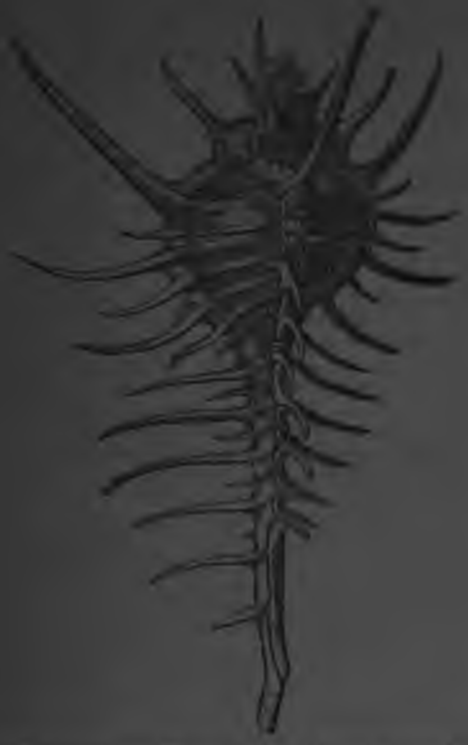
Locality.—The Indian Ocean; Moluccas.

This is the *Venus's Comb* of collectors, and when perfect is a most delicate and striking shell.

B. Species with a very long tube and without spines. (Genus *Brontes*, De Montf.)

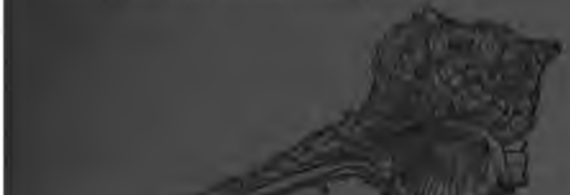
Example, *Murex Haustellum* (*Snipe's or Woodcock's head* of collectors).

Description.—Shell anteriorly ventricose, naked, scarcely armed, fulvous inclining to red, lineated with bay; body of the shell rounded and furnished with three or more ribs between the varices; the tube very long and slender; the spire short; mouth roundish, red.



Murex Tribulus (Thorny Woodcock; Murex tenuispina, Lam.)

Locality, the East Indian Ocean; Moluccas.



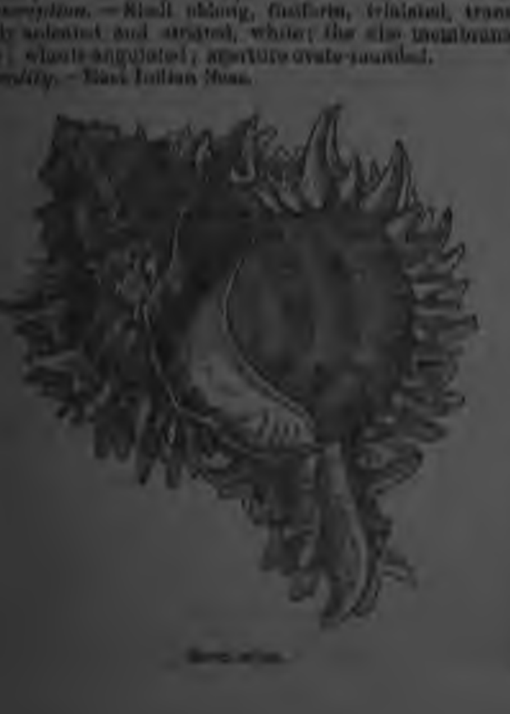
Murex Haustellum.

C. Species with three elevated, flattened, and comparatively thin varices.

Example.—*Murex acanthopterus.*

Description.—Shell oblong, fusiform, trifaried, transversely sulcated and striated, white; the alæ membranaceous; whorls angulated; aperture ovate-rounded.

Locality.—East Indian Seas.



Murex adustus.

D. Species with three ramified varices. (Genus *Chicoreus*, De Montf.)

Example, *Murex adustus.*

Description.—Shell oblong-ovate-fusiform, subovate, ventricose, thick, with three rows of frond-like ramifications, transversely sulcated, black; the fronds short, curved and densely muricated; the tubercle of the interstices very large; aperture small, rounded, white.

Locality.—East Indian Ocean.

E. Species which have a greater number of varices; the tube nearly closed.

Example, *Murex regius.*

No description can convey an adequate idea of the splendid colouring of this species when it is in fine condition; the *form* is given below.

Locality.—The western coast of Central and South America.

F. Subfurriculated species.

Example, *Murex lyratus.*

Description.—Shell fusiform-turreted, thin, multifariously varicose, horny-fulvous; the varices thin and lamelliform; the interstices smooth; the whorls convex; the tube short.

G. Subturreted species; the tube closed; a tube pierced towards the posterior extremity of the right side, and persistent upon the whorls of the spire. (Genus *Typhis*, De Montf.)

Example, *Murex pungens*, fossil.

H. Species more globular; the spire and canal shorter, very open; the aperture rather wide.

Example, *Murex vitulinus.*

Description.—Shell ovato-oblong, ventricose, somewhat rough, with seven rows of varices which are oblique, separate, and ruddy; the interstices white; tube narrow, somewhat acute; the aperture white; the lip toothed internally.

I. Species which have an oblique fold very much anterior to the columella, and an umbilicus. (Genus *Pisa*, De Montf.)

Murices have been found on different bottoms at depths ranging from five to twenty-five fathoms; and species of *Typhis* on sandy mud at depths varying from six to eleven fathoms.

Lamarck records 55 recent and 15 fossil species, mostly from Grignon. To the recent species are to be added 26 *Murices* described by Mr. Broderip from specimens brought home by Mr. Cuming, and 5 of *Typhis* (recent), also described by Mr. Broderip.

M. de Blainville remarks that among the fossil species of France there is no true analogue; but he adds that Defrance, who admits 50 fossil species, counts 30 analogues from the *Placentin*, after Brocchi.

M. Deshayes in his tables makes the number of recent species of Murex (apparently including *Typhis*) 75, a number much below the mark, and gives 89 as the number of fossil species (tertiary). Of these last he records the following as having been found both living and fossil (tertiary): —*cornutus, Brandaris, trunculus, erinaceus, tripterus, cristatus, fistulosus, tubifer*, a new species, *elongatus, angularis, saxatilis* (var.), another new species, *Lassaignei*, and a third new species.

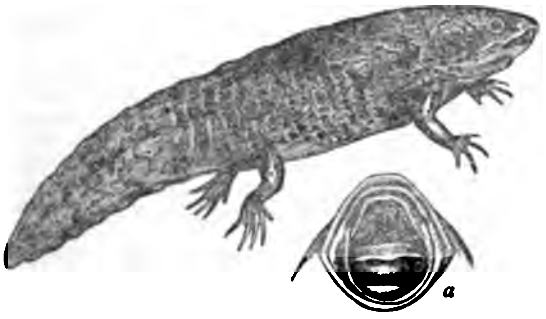
Dr. Mantell records one species (*argutus*) from the blue clay of Bracklesham (Sussex); and another (*Smithii*) from the arenaceous limestone of Bognor. Professor Phillips names one (*Hunsmanensis*) from the coralline oolite of Yorkshire. Dr. Fitton records one (*Calcar*) from the gault of Kent and Blackdown; and Mr. Lea one from the Claiborne tertiary, Alabama.

The ENTOMOSTOMATA and *Siphonostomata* may be considered as the two great tribes of carnivorous gastropods or trachelipods appointed to keep down the undue increase of the CONCHIFERA and herbivorous gastropods, whose shells the majority of these carnivorous testaceans penetrate by means of an organ which makes a hole as truly round as if it had been cut by an auger, and then feed on the juices of the included animal.

Dr. Buckland notices this habit with a view to the condition of the testaceous inhabitants of the earlier seas of our planet with his wonted felicity. 'Most collectors,' says the Professor, 'have seen upon the sea-shore numbers of dead shells, in which small circular holes have been bored by the predaceous tribes, for the purpose of feeding upon the bodies of the animals contained within them: similar holes occur in many fossil shells of the tertiary strata, wherein the shells of carnivorous trachelipods also abound; but perforations of this kind are extremely rare in the fossil shells of any older formation. In the green-sand and oolite they have been noticed only in those few cases where they are accompanied by the shells of equally rare carnivorous mollusks; and in the lias and strata below it,* there are neither perforations, nor any shells having the notched mouth peculiar to perforating carnivorous species. It should seem from these facts that, in the economy of submarine life, the great family of carnivorous trachelipods performed the same necessary office during the tertiary period which is allotted to them in the present ocean. We have further evidence to show that in times anterior to and during the deposition of the chalk, the same important functions were consigned to other carnivorous mollusks, viz. the testaceous cephalopods: these are of comparatively rare occurrence in the tertiary strata and in our modern seas; but throughout the secondary and transition formations, where carnivorous trachelipods are either wholly wanting or extremely scarce, we find abundant remains of carnivorous cephalopods, consisting of the chambered shells of *nautili* and ammonites, and many kindred extinct genera of polythalamous shells of extraordinary beauty. The molluscous inhabitants of all these chambered shells probably possessed the voracious habits of the modern cuttle-fish; and by feeding like them upon young *testacea* and *crustacea*, restricted the excessive increase of animal life at the bottom of the more antient seas. Their sudden and nearly total disappearance at the commencement of the tertiary era would have caused a blank in the "police of nature," allowing the herbivorous tribes to increase to an excess that would ultimately have been destructive of marine vegetation, as well as of themselves, had they not been replaced by a different order of carnivorous creatures, destined to perform in another manner the office which the inhabitants of the ammonites and various extinct genera of chambered shells then ceased to discharge. From that time onwards we have evidence of the abundance of carnivorous trachelipods, and we see good reason to adopt the conclusion of Mr. Dillwyn, that in the formation above the chalk the vast and sudden decrease of one predaceous tribe has been provided for by the creation of many new genera and species possessed of similar appetencies, and yet formed for obtaining their prey by habits entirely different from those of the cephalopods. The design of the Creator seems at all times to have been to fill the waters of the seas and cover the surface of the earth with the greatest possible amount of organised beings enjoying life; and the same expedient of adapting the vegetable kingdom to become the basis of the life of animals, and of multiplying largely the amount of animal existence by the addition of *carnivora* to the *herbivora*, appears to have prevailed from the first commencement of organic life to the present hour.' (*Bridgewater Treatise.*)

SI'RACUSE. [SYRACUSÆ.]

SIRE'DON, Wagler's name for the AXOLOTL. Since that article was written, further information has been obtained relative to the structure of this genus of perennibranchiate Batrachians. The form and character of the teeth, as given by Professor Owen, will be found in the article SALAMANDRIDÆ, vol. xx., p. 328, and we avail ourselves of this opportunity to introduce a reduced copy of the figure of the animal, lately published by MM. Duméril and Bibron, to whose excellent work on Reptiles we refer for the latest particulars known.



Siredon seen in profile; *a*, mouth seen in front, open to show the teeth.

We shall confine ourselves in this article to an account of its organization, as observed by Cuvier, so that the reader may have some notion of its relationship to the other perennibranchiate Batrachians.

Cuvier then remarks that the Axolotl approaches nearly to the Salamander, and especially to its larva. The cranium of the Axolotl is indeed more depressed; its sphenoïd bone wider and flatter; the bones of the nose proportionally smaller; the ascending apophyses of the intermaxillary bones longer and narrower; but, especially, in lieu of those large and fixed bones which Cuvier calls vomers or palatines, there are two oblong plates detached from the cranium beset with teeth in quincuncial order, and continuing themselves with the pterygoïds, which reach them because they are longer than in the Salamander, and which also carry teeth in front on their external edge. Behind, these pterygoïds are widened, without always articulating themselves to the sphenoïd, as in the Salamander of the Alleghanies. [SALAMANDRIDÆ, vol. xx., p. 332.] The space between the orbital and the petrous bone is also more considerable than in the Salamanders. The lower jaw has a regular dental portion forming the symphysis and the greatest part of the external surface, and armed all along its superior edge with small, fine, and pointed teeth; an articular portion, which doubles the posterior part of the internal surface of the preceding, forms the posterior angle and carries the articular tubercle; lastly, there is a true opercular bone, long and delicate, covering at the internal surface the interval of the two preceding, but furnished throughout with very small pointed teeth arranged in quincuncial order. And this is the structure which we find in the SIREN, with this difference, that the dental portion in the latter has no true teeth, which are only seen on the opercular bone.

In all the Axolotls that Cuvier examined, the branchial apparatus was cartilaginous. It consisted of two suspensory branches, or anterior horns, affixed to the cranium under the fenestra rotunda, carrying an unequal piece, to which two lateral branches were attached on each side: the first carried the first arch of the branchiæ; the second, the three others. The first of these arches had dentilations on its posterior border; the two intermediate ones, on both their borders. Under the unequal piece was one which went backward, and whose extremity was bifurcated.

When Cuvier wrote this description (in the *Ossemens Fossiles*), he thought that this animal was the larva of some unknown Salamander; but in his last edition of the *Règne Animal* he corrected this conjecture, and placed it where all zoologists now place it, among the Batrachians.

SIREN (Zoology), a genus of Perennibranchiate Batrachians.

Generic Character.—Form elongated, nearly like that of the eels; branchial tufts three on each side; no posterior feet, nor any vestige of a pelvis; head depressed; gape of the mouth not wide; muzzle obtuse; eye very small; the ear concealed; lower jaw armed with a horny sheath and several rows of small teeth; the upper jaw toothless; but numerous small, pointed, retroverted teeth occur on the palatal region. [SALAMANDRIDÆ, vol. xx., p. 328.]

Dr. Garden appears to be the first who called attention to this form, which is declared by Cuvier to be one of the most remarkable of the class of Reptiles, and indeed of the whole animal kingdom, from the anomalies of its organization, and its apparent relationship with different families, and even classes. Dr. Garden (1765-1766) sent a description of this reptile to Linnæus and Ellis, and the former, relying upon Dr. Garden's assurance that the Siren did not change its form, established an additional order for it in his class *Amphibia*, with the name of *Meantes*.

Pallas, Hermann, Schneider, and Lacépède however saw, as Cuvier remarks, nothing more in the *Siren* than the larva of some large unknown Salamander; whilst Camper, followed by Gmelin, went so far as to give it a place among the fishes. The latter arranges it at the end of the Eels, under the name of *Muræna Siren*. These differences of opinion sufficiently show the doubts which arose on the examination of this extraordinary form.

Cuvier, in 1807, satisfactorily established, in a memoir read to the Institute of France, and inserted in the 1st vol. of the 'Zoological Observations of Humboldt,' that whatever changes it might undergo, the Siren was a reptile *sui generis*, which never could have hind feet, and whose whole bony framework differed essentially from that of the Salamanders; that there was no probability that it ever changed its form or lost its *branchiæ*; and that the *Siren* is consequently a true amphibian, which respires at will throughout be live either in the water by means of branchiæ, or in the air by means of lungs. This conclusion rested upon that solid basis which has given such value—a value daily becoming more appreciated—to the views of the great zoologist,—his personal observations made on the osteology and splanchnology of the animal.

---

* Carnivorous gastropods occur in the Silurian rocks; and the long tube of the *Siphonostomata* is equally characteristic of carnivorous habits with the notch of the *Entomostomata*.

Dr. Garden had, in his correspondence with Linnæus and Ellis, come to the same conclusion from other evidence. Dr. Garden had observed the animal from the length of four inches to that of three feet and a half; he had satisfied himself that in the whole province there was not, with the exception of the alligator, any Saurian or Salamander which exceeded six or seven inches in length; and he had convinced himself that it was oviparous, and that it propagated without losing its branchiæ.

John Hunter, as we shall presently see, declared the Siren to be a complete form, on the most satisfactory evidence; the specimens dissected by him were brought from South Carolina in 1766.

That the Siren is a perfect animal belonging to the perennibranchiate batrachians is now admitted by all zoologists. Cuvier indeed remarks (*Règne Animal*), that the branchiæ of *Siren intermedia* and *Siren striata* have been regarded as not participating in their respiration, and that in consequence Mr. J. E. Gray has formed them into the genus *Pseudobranchus*. Cuvier however adds, that it is, nevertheless, not difficult to see on their lower surface folds and a vascular apparatus, the use of which does not appear doubtful to him; and that M. Leconte has satisfactorily demonstrated that both these species, as well as *Siren lacertina*, are perfect animals.

Cuvier remarks that the *Siren* should be judged of not from *Amphiuma* but from itself. He accordingly procured some sirens, and saw an osteology so finished and so firm, that it was impossible to believe that they were not adult. The branchiæ of these individuals were perfectly entire, and their lungs completely developed, and rich in well-filled vessels. No doubt therefore existed in his mind that the animals used both.

He observes, that it had been objected that it would be impossible for these animals to respire air without ribs or diaphragm, and without the power possessed by the tortoises and frogs to cause it to enter by the nostrils, in order that, so to speak, it might be swallowed, because the nostrils of the Sirens do not lead into the mouth, and the branchial apertures must let it escape. But his own observations made upon well preserved individuals showed Cuvier that the nostrils in the Siren *do communicate* with the mouth by a hole pierced, as in the *Proteus*, between the lip and the palatal bone which carries the teeth. The membranous opercula of their branchiæ are muscular internally, and capable of hermetically sealing the apertures; then it is very easy for the siren, by dilating its throat, to introduce the air into the mouth, and to force it afterwards, by contracting the throat, into its larynx. Even without this structure of the nostrils, the animal could produce the same effect by opening its lips a little: a theory which Cuvier applies to the *Proteus* as well as the *Siren*.

The simultaneous existence, observes the same author, of a larynx and a trachea with a branchial apparatus not only permanent, but perfectly ossified in many of its parts, is also worthy of especial attention, and proves, as is evident in the frogs and salamanders, that the branchial apparatus is no other than a more complicated os hyoides, and not a combination of pieces proceeding from the sternum and larynx. He adds, that it is to the salamanders that the Siren approach most nearly by the structure of the head, although neither the general form nor the proportions of the parts have so near similarity.

Having thus given a general view of the *conformation* of this extraordinary animal, we proceed to a sketch of the details of its

ORGANIZATION.

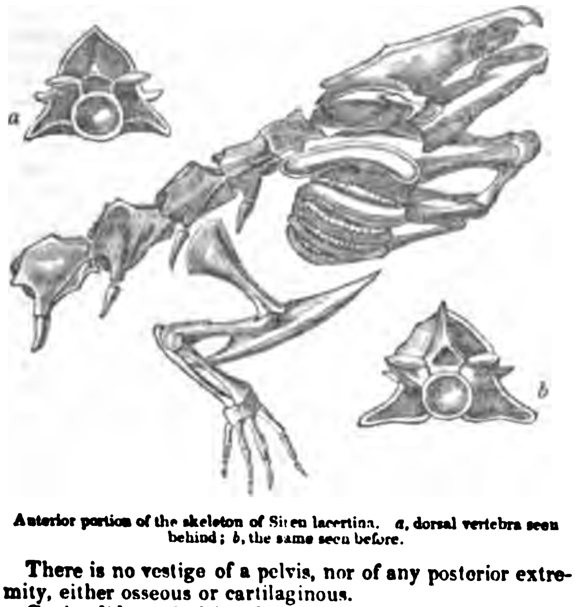
Skeleton.—The *skull* of the siren is narrowed in front by reason of the excessive reduction of the maxillary bones, which consist only of a very small osseous point. Behind there is a strong occipital crest on the parietal and petrous bones. The pieces which form the lower jaw, instead of being transverse like the branches of a cross, are directed obliquely forwards. The parietal bones occupy the greatest portion of the upper part of the cranium. They have each in front a point, extending so as to lodge between them the posterior part of the principal frontal bones, which have each a groove for the lodgment of the posterior point of two slender bones, which proceed beside each other to the end of the muzzle. At their sides are attached two other bones, which are slender and pointed backwards, and which descend and widen far in order to form the anterior edge of the jaw. Cuvier takes the first for the nasal bones, and the others for intermaxillary bones. These last are toothless, but their edge is trenchant, and furnished, when the animal is alive or well preserved, as well as the edges of the lower jaw, with a sheath which is nearly horny, is easily detached from the gum, and has its analogue in the tadpoles of the *frogs*. [SALAMANDRIDÆ, vol. xx., p. 395.] Between them, at the end of the osseous muzzle, is an aperture, but not that of the nostrils. In the recent animal it is closed, and the nostril is pierced on each side on the outside of the intermaxillary bone. In the crocodile the intermaxillary adheres to the external side of the nasal bone; and all the reptiles, except the crocodile, have the nostril on the outside of the ascending apophyses of the intermaxillary bone; but the peculiarity in the Siren is, that the intermaxillary ascending to the frontal bone entirely separates the nasal bone from the frame of the external nostril. The maxillary bone excludes the nasal in the same way in the chameleon. A very small bone, suspended in the flesh below the external nostril, and without any tooth, is the sole perceptible vestige of the maxillary bone. The cavity of the nostril is covered below with a simple ligamentous membrane. The internal nostril is situated on each side, near the commissure of the lips, between the lip and the palatine teeth. All the lower part of the cranium and the face is composed of a large and wide sphenoid, which extends from the occipital hole to the intermaxillaries. The sides of the cranium, in the orbital region and the front of the temporal fossa, are closed by a single bone, in which are pierced, forward, the olfactory aperture; farther back, the optic hole, and another for the first branch of the fifth pair, and probably for the small nerves of the eye. The *inferior* surface of this lateral bone forms part of the palate at the sides of the sphenoid bone. It is plain that it performs the functions of the orbital part of the sphenoid bone, or what has been called the anterior sphenoid, and that it fulfils in part those of the ethmoid. Between it and the petrous bone is a great membranous space, in which is pierced the hole for the rest of the fifth pair of nerves. The petrous bone and the lateral occipital bone are perfectly distinct. It is in the petrous bone only that the fenestra ovalis is pierced, or rather cut out, but the lower part of its frame is, nevertheless, completed by the lateral occipital and the sphenoid. Its aperture, which is large, is directed a little downwards. In the fresh state it is closed by a cartilaginous plate similar to that in the Salamander. There is only a single tympanic bone fixed obliquely by its posterior stem on the superior surface of the petrous bone, and enlarging below nearly like a trumpet, in order to furnish a large facet to the lower jaw. Cuvier found neither mastoïdian, pterygoïdian, jugal, superior occipital, nor basilary bone, and he remarks that the occurrence of the two last is impossible, when the position of the suture, which separates the lateral occipital bones, is considered. To the palate, under the anterior and lateral part of the sphenoïd and orbital bones, are fitted two delicate plates beset with hooked teeth. They may be taken for the vestiges of vomers and of palatines, or, if it be preferred, of palatines and pterygoïdians; but Cuvier did not find sufficiently marked characters to warrant giving them those names. The first, which is the largest, has six or seven oblique rows of pointed teeth, making a kind of wool-card. Those of the middle have each twelve teeth; the anterior and posterior ones have less. The second plate has four rows of similar teeth, each row consisting of from five to six.

The lower jaw of the Siren is composed of four bones on each side; one of which forms the symphysis and the trenchant border of the jaw, which it invests externally up to near its posterior extremity. One cannot, Cuvier observes, avoid taking it for the analogue of the dental portion, but it is not the portion which carries the teeth, and it has only its trenchant edge invested in the fresh animal with a horny covering, analogous to that which forms the edge opposed to the upper jaw. The posterior extremity of this trenchant edge, more elevated than the rest of the border of the bone, serves for the coronoïd apophysis. The second bone forms the greatest portion of the internal surface and the posterior angle, and carries, above, the third, which is the articular tubercle. The fourth is a delicate and narrow lamina which performs the office of the opercular bone, and covers, on the internal surface, a vacancy left between the two first. The whole of this bone is beset with small pointed teeth disposed quincuncially like those of the palatal plates.

The *os hyoïdes* of the Siren is an os hyoïdes of the larva of a Salamander or of the Axolotl, but very much ossified in many of its parts. The suspensory branch or anterior horn is a bone stouter and longer than the humerus, dilated at its two ends, narrowed in its middle, and suspended to the cranium by a ligament. The first unequal piece is also a very hard bone dilated anteriorly, compressed posteriorly, and narrowed in its middle. The second unequal piece is a pedicle, which is divided behind into many radiating apophyses: the whole of this, again, is very bony, and the two lateral branches are equally so. The first, which is the stoutest, carries the first arch of the branchiæ; the second, which is more slender, carries the three others. These gill-arches are not ossified, but always remain cartilaginous, as in the Axolotl, and are, like those of the Axolotl, denticulated. They are united by ligaments at their external extremity, which a ligament attaches also to the root of the anterior horn. The same pieces, or very nearly the same, may be seen in the *Proteus*.

The *shoulder-blade* of the Siren is slender, nearly cylindrical, narrowed in its middle, and augmented, on the spinal side, by a cartilaginous lamina. The *clavicle* and the *coracoïd* are represented by two cartilaginous lobes, one directed forwards, the other much wider, proceeding upon the breast and crossing upon that of the opposite side. In the external border of this coracoïd cartilage, near and a little behind the articular fossa, is a bony semilunar lamina which is the sole representative of the bony coracoïd: but there is nothing similar for the clavicle. The *humerus* compressed laterally above, from before backwards below, and narrowed in its middle, has its extremities cartilaginous. It is the same with the two bones of the fore-arm, both rather slender, and the internal bone or radius widened below. The bones of the *carpus* remain cartilaginous.

Each of the four *fingers* has a metacarpian and two phalanges only.

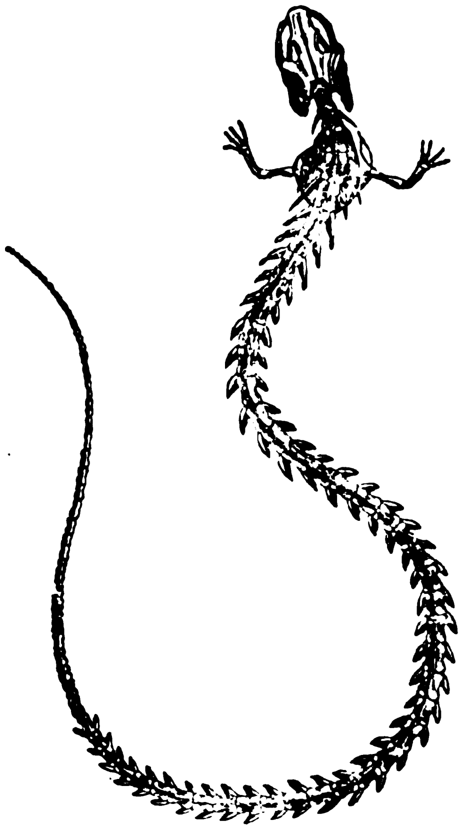


Anterior portion of the skeleton of Siren lacertina. *a*, dorsal vertebra seen behind; *b*, the same seen before.

There is no vestige of a pelvis, nor of any posterior extremity, either osseous or cartilaginous.

Cuvier did not find in a large individual more than forty-three *vertebræ* in the trunk and forty-four in the tail: but the individual which he described in 1807 had three more. These vertebræ, all perfectly ossified and complete, do not resemble in his opinion those of any of the reptiles of which he had previously treated, nor indeed of any other animal. Their bodies have their two articular faces hollow and united by a cartilage in the form of a double cone, as in the fishes. Their articular apophyses are horizontal, and the posterior apophyses of one vertebra lie on the anterior apophyses of the other. A horizontal crest on each side goes from the anterior to the posterior. In lieu of a spinous apophysis, they have a vertical crest, which at half its length becomes bifurcated, and the branches go to terminate on the articular posterior apophysis. Their very wide transverse apophyses are composed of two laminæ united at their posterior border up to their common point; the upper, which is oblique, coming from below the anterior articular apophysis and from below the neighbouring part of the lateral crest, the lower coming from the sides of the body, to which it adheres by a horizontal line. The body below is also compressed into a sharp ridge (arête).

In the *vertebræ* which carry the *ribs*, the upper lamina of the transverse apophysis is but little marked, and the point is stout and divided into two lobes for the two tubercles of the rib, as in the salamanders. Cuvier only found eight of these vestiges of ribs on each side, commencing from the second vertebra. The two last have the head simple. At the tail, the transverse apophyses, which have already become rather small, promptly disappear: the articular apophyses diminish also by degrees. The body of the vertebra takes a very compressed form, and gives below two small laminæ, which intercept a canal for the vessels, like the chevron bones in the lizards.



Entire skeleton of Siren lacertina.

Respiratory Organs.—John Hunter in 1766 gave the following accurate and interesting description of the two-fold respiratory apparatus of the Siren:—"On the posterior and lateral parts of the mouth are three openings on each side; these are similar to the slits of the gills in fish, but the partitions do not resemble gills on their outer edges, for they have not the comb-like structure. Above and close to the extremity of each of these openings, externally, so many processes arise, the anterior the smallest, the posterior the longest; their interior and inferior edges and extremity are serrated, or formed into fimbriæ: these processes fold down and cover the slits externally, and would seem to answer the purposes of the comb-like part of the gill in fish. At the root of the tongue, nearly as far back as these openings reach, the trachea begins, much in the same manner as in birds. It passes backwards above the heart, and there divides into two branches, one going to each lobe of the lungs. The lungs are two long bags, one on each side; which begin just behind the heart, and pass back through the whole length of the abdomen, nearly as far as the anus. They are largest in the middle, and honeycombed on their internal surface through their whole length.' (*Phil. Trans.*, lvi., 1766.)

In the Museum of the Royal College of Surgeons in London this part of the organization is well illustrated. No. 1063 presents a *Siren lacertina*, with the ventral parietes of the abdomen removed, together with all the viscera, except the lungs, which have been distended with spirit. These commence immediately below the pericardium, and extend almost to the anus. A bristle is passed through the trachea, and the laryngeal orifice is exposed by the removal of the sternum. The branchiæ are external, three on each side, and suspended to four cartilaginous arches of the hyoid bone. The three external branchial apertures of the left side may be seen. No. 1062 exhibits the right side of the head of a larger specimen of *Siren lacertina*, showing the branchial arches and gills of that side. The first and fourth branchial arches are fixed, the intermediate ones only being free. Their concave margins are provided, as in many fishes, with small pointed processes, which lock into one another and defend the branchial passages. The gills increase in size from the first to the third, which is suspended to both the third and fourth arches. They are subdivided and fimbriated inferiorly, where the surface is most vascular; the branchial arteries may be seen injected on the convex side of the cartilaginous arches. The origin and subsequent reunion of the branchial vessels to form the aorta are shown in the preparation No. 914 (from which the present was taken) noticed below. No. 1064 is a portion of the lungs of the same *Siren*, laid open to show the ramifications of the pulmonary artery, which form a reticular network upon the internal surface of this simple respiratory bag. (*Catalogue*, vol. iii.)

Circulating System.—John Hunter describes (1766) the heart of the Siren as consisting of one auricle and ventricle. 'What answers,' says Hunter, 'to the inferior vena cava, passes forwards above, but in a sulcus of the liver, and opens into a bag similar to the pericardium; this bag surrounds the heart and aorta as the pericardium does in other animals; from this there is an opening into a vein which lies above, and upon the left of the auricle, which vein seems to receive the blood from the lungs, gills, and head, is analogous to the superior vena cava, and opens into the auricle which is upon the left ventricle. The aorta goes out, passing for a little way in a loose spiral turn, then becomes straight, where it seems to be muscular: at this part the branches go off, between which there is a rising within the area of the aorta like a bird's tongue, with its tip turned towards the heart. This account of the venæ cavæ opening into the cavity of the pericardium may appear incredible; and it might be supposed that, in the natural state of the parts, there is a canal of communication going from one cava to the other, which being broken or split through in the act of catching or killing the animal, would give the appearance above described. I can only say that the appearances were what have been described in three different subjects which I have dissected, and in all of them the pericardium was full of coagulated blood. But besides the smallness of the subjects, it may be observed that they had been long preserved in spirits, which made them more unfit for anatomical inquiries. They had been in my possession above seven years.' (*Phil. Trans.*, 1766.)

In the Museum of the College of Surgeons the preparation No. 912 shows the anterior part of the body of a *Siren lacertina*. The ventral parietes have been removed, together with the pericardium, to show the heart *in situ*. It is of an elongated form, and consists of a large fimbriated auricle, divided internally into two chambers, and of a flattened oblong ventricle, giving off a single artery, which, after a half-spiral twist, dilates into an elongated fleshy bulbus arteriosus. The blood from the body passes into a large membranous sinus formed by the union of the two anterior venæ cavæ with the large posterior cava. The latter vessel pours its blood into the sinus by two orifices on either side a septum which extends forwards as far as the openings of the anterior cavæ, where it terminates in a free semilunar margin; the sinus is then continued forwards, and terminates in the chamber analogous to the right auricle. White bristles pass from the posterior cava through the sinus on either side the septum into the anterior cavæ. A black bristle is passed through the right pulmonary vein into the trunk common to the two, which traverses but does not communicate with the sinus proper to the veins of the body, and terminates in the chamber analogous to the left auricle.

The bulbus arteriosus is laid open, to show the valvular protuberance which projects into it from the dorsal aspect. On the opposite side of the preparation the sternum and upper jaw are removed to show the apertures leading from the mouth to the lungs and gills, the simultaneous existence of which through life forms the chief characteristic of this tribe of truly amphibious reptiles. No. 913 is the heart of a Siren. The auricle, consisting of two chambers, appears as one cavity externally. It is remarkable for its large size, its weak parietes, and the number of fimbriated folliculiar processes which it sends off, and which gives it an appearance similar to the branchial divisions of the vena cava in the cephalopods. The ventricle is here seen to be slightly bifid at the apex. The artery is constricted at its commencement. The bulb is here laid open to show the internal valvular projection. No. 913 A presents the heart and pericardium of a *Siren lacertina*, prepared to show the internal structure of the auricles and ventricle. White bristles pass from the veins of the body into the right auricle, and black ones through the pulmonary veins into the left auricle. This is much smaller than the right auricle, corresponding to the quantity of blood which it receives. The pulmonary veins unite into a common trunk, which seems to pass through the great sinus of the veins of the body, but it adheres to the parietes of that sinus by its posterior surface. Here Professor Owen remarks that it is probably this remarkable structure which led Hunter to suppose that the sinus was part of the pericardium, and that the venæ cavæ opened into it. The Professor then quotes Hunter's description, above given, and adds, with truth, that all anatomists since Hunter's time have concurred in ascribing but one auricle to the heart of the Siren, and that Cuvier regards this simple structure of the central organ of the circulation as common to the Batrachian order of reptiles. The outward form of the auricle, observes Mr. Owen, naturally suggests such an idea, and it is only in favourable specimens that the true structure, as it is shown in this preparation made by him, can be made out. The ventricle is connected to the pericardium, not only by the reflection of the serous layer from the bulbus arteriosus, but by a duplicature of the same membrane, which passes from the lower third of the posterior edge of the ventricle, and incloses the coronary vein: this vein is continued from the apex of the ventricle to the sinus. The muscular parietes of the ventricle are about a line in thickness, and of a loose fasciculate structure. The cavity is partially divided by a rudimentary septum, which extends from the apex half way towards the base of the ventricle, and there terminates in a concave edge directed towards the orifice of the artery. The whole inner surface is reticulated by decussating carneæ columnæ, one of which has been detached from its connexion to the septum, which intervenes to the two auricular apertures, and which supports the valvular structure that closes them from within. The artery and bulbus arteriosus are laid open, showing in the latter the remarkable valvular projection described by Hunter. In conclusion, Professor Owen remarks that the vessels on the back part of the talc, which supports the preparation, are, the inner ones, the pulmonary arteries, the outer ones, the jugular veins or anterior cavæ. No. 914 is the anterior part of the body of a large *Siren lacertina*, prepared to show the heart and principal vessels injected. The fimbriated structure and magnitude of the auricles are well seen when thus distended, and they then advance forwards on both sides of the ventricle and bulb, so as almost to encompass those parts. The two divisions of the venous sinus may be observed below the ventricle, with the termination of the coronary vein and the attachment of the ventricle to the sinus. Behind the ventricle appear two superior cavæ which terminate at the sides of the sinus. The portions of the lungs which remain are laid open to show their reticulate structure, and the relative positions of the pulmonary arteries and veins: white bristles are placed in the former, and black ones in the lateral vessels. On the left side of the preparation, the origin of the pulmonary artery, from the posterior branchial arch, is shown. The remainder of the branchial vessels, with the exception of small branches to the head, are collected into one trunk, which unites with the corresponding vessels of the opposite side to form the aorta or systemic artery. The tongue, the interior of the air tube, the internal branchial aperture, and the branchiæ of the left side, the eye and nostril, and structure of the integument are also favourably displayed in this preparation. [PROTEUS and PROTEIDÆ.]

We now proceed to lay before our readers such other preparations in this noble collection as illustrate the circulating system in animals approximating to the perennibranchiate batrachians, so that the student may compare this part of their organization with that of the Siren.

No. 915 shows the anterior part of the body of an AMPHIUMA (*Amph. means*, Garden), prepared to show the heart and great vessels *in situ*. Professor Owen states that the blood is returned from the body, as in the preceding species, by two anterior venæ cavæ, and one large posterior cava, which form by their union a membranous sinus. The auricles or venous chambers of the heart are proportionately smaller and less fimbriated, and are situated more to the left and superior part of the ventricle. The ventricle is connected to the pericardium at its apex, and gives off from its opposite extremity a single artery, which, after a half-spiral turn, dilates into a large bulb, which is broader and shorter than in *Siren lacertina*, and is grooved externally. The two pulmonary arteries are given off from the posterior part of the extremity of the bulb, which then divides into two branches, each of which again subdivides on the side of the œsophagus. As there are no external gills, so there are no lateral branches sent off from the branchial arteries; but these, after winding round the arches of the hyoïd bone, terminate in a single trunk on either side, and form by their union the aorta, which is seen, injected, behind the pharynx. On the left side of this preparation the internal branchial aperture is preserved, and on the right side the branchial arches of the hyoïd bone are shown. The lungs are laid open so as to display their reticulate and longitudinally plicate structure, and the relative positions of the pulmonary arteries and veins.

Professor Owen further observes that this preparation is figured by Rusconi (*Amours des Salamandres Aquatiques*, pl. v., fig. 8) as a portion of the adult *Siren lacertina*, which he supposes to have lost the external branchiæ, and to have acquired the posterior extremities in a manner analogous to the salamanders; and that Rusconi endeavours to invalidate the opinion which Hunter, after an extensive and minute comparison of their entire structure, had formed of the specific difference of the *Amphiuma* and *Siren*, as well from each other as from the *Kuttewague* or *Menopoma* of Harlan. The manuscript alluded to by Rusconi, and which contains detailed accounts of the anatomy of *Amphiuma* and *Menopoma*, as well as of the *Siren*, is given entire in the description of the plates illustrative of the 2nd vol. of the Museum Catalogue, where (plates xxiii. and xxiv.) the circulating and respiratory organs of the 'Chuah Chisstannah, or Crawfish-eater, or Kattewagoe' (*Menopoma Alleghaniensis*, Harlan [SALAMANDRIDÆ, vol. xx., p. 332], are beautifully displayed; and Professor Owen remarks that the conclusions as to the distinctions of these amphibia to which Hunter arrived, have been subsequently confirmed by a similar series of investigations instituted by Cuvier, and above noticed.

No. 916 of the same museum exhibits the lower jaw, tongue, fauces, with part of the abdominal viscera, and the heart *in situ* of *Menopoma Alleghaniensis*. The greater part of the pericardium has been removed. The ventricle is of a flattened triangular form, resembling that of osseous fishes: the auricles are smaller in proportion than in the *Siren*, and are situated wholly to the left of the ventricle. The veins of the body terminate in a membranous sinus situated below the auricles. The aorta, after making a spiral turn to the left side, dilates into a large bulb which gives off four vessels on each side. The first or posterior pair are the smallest, and ramify on the œsophagus and lungs; but they are not distinctly shown in this preparation. The second and third pairs are the largest: they are seen passing outwards, and winding round the arches of the hyoïd bone. The two branches unite on each side, and, after sending off small arteries to the head, converge on the posterior part of the œsophagus, and unite to form the descending aorta. The fourth small pair of arteries pass outwards, and wind over the anterior part of the first hyoïdian arch: they send off in this course some small arteries to the head; and ultimately unite with a cephalic branch given off from the united trunk of the third and second branchial arteries. The right lung is here preserved, and a black bristle is inserted into it from the trachea. White bristles are placed in the right branchial aperture, which is left entire, showing the absence in this form, as in *Amphiuma*, of external gills. On the left side the branchial arches of the hyoïd bone are preserved. Besides the parts concerned in the circulatory and respiratory functions, the stomach, duodenum, liver, pancreas, and spleen are well shown in this preparation. No. 917 exhibits the heart, pericardium, and trachea of the last-noticed species. Here the ventricle is laid open to show the loose, fasciculate, muscular structure, which, as in the *Testudo Indica*, occupies the whole of its cavity. The bulb of the aorta is laid open to show the two rows of semilunar valves, three in each row, and the origins of the branchial arteries. The preparation is suspended by the pericardium, behind which is the flattened air-tube, in which distinct cartilaginous rings may be seen. (*Catalogue*, vol. ii.)

Generative System.—No. 2695 exhibits the posterior part of a *Siren lacertina*, with the ventral parietes of the abdominal cavity removed to display the female organs of generation. The ovaria are seen as two irregular elongated bodies, situated on each side of the root of the mesentery, and bearing impressions of the convolutions of the intestines. They contain innumerable minute ovisacs of a greyish colour, with a few others of a larger size, and of a very dark colour. The oviducts are external to the ovaria, and are attached to the sides of the spine, each by a broad duplicature of peritoneum: they commence anteriorly by a simple, elongated, slit-like aperture, without fimbriated margins, and are immediately disposed in about twenty parallel transverse folds, which gradually diminish, and finally cease about three inches from the cloaca, where the oviducts open behind the rectum upon small prominences: bristles are placed in these outlets. The contracted allantoïd bladder is seen anterior to the rectum: the posterior extremity of the kidney extends behind the oviducts, a short way beyond the cloaca. No. 2696 shows the anterior extremity of the oviducts and liver of a Siren. The oviducts are much attenuated at their commencement, but soon increase in size, and become thicker in their parietes. (*Catalogue*, vol. ii.)

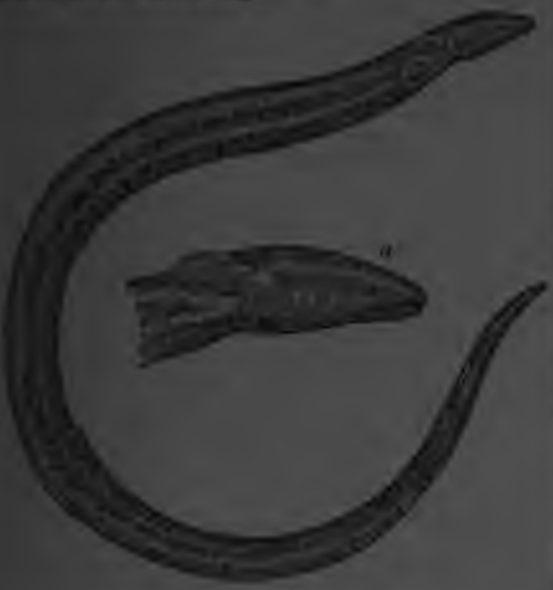
No preparation of the male organs of the *Siren* appears to exist in the College Museum: but there are two illustrative of those of *Amphiuma* and *Menopoma*, which we proceed to lay before our readers.

No. 2397 is the posterior moiety of an Amphiuma (*Amphiuma didactylum*), with the abdominal cavity laid open, and exposing to view the termination of the intestinal canal, supported by its broad and simple mesentery, the termination of the right lung, the long allantoïd bladder attached by a duplicature of the peritoneum to the mesial line of the abdomen, and the testes with their adipose appendages: the latter may be observed projecting on each side of the root of the mesentery; and behind them are the testes, elongated, subcylindrical, ash-coloured bodies, tapering at both extremities: the vasa deferentia descend in the form of white ligamentous tubes, and finally open into the posterior part of the termination of the rectum, which is laid open. The renal organs are almost concealed by the parts above described: they have been injected. No. 2938 exhibits the male organs, kidneys, allantoïd bladder, and large intestine of the Menopome (*Menopoma Alleghaniensis*). The testes in this subject are less elongated, and of a more compact oval, thus indicating a further stage of advancement above the class of fishes. The efferent vessels leave the testis at a longitudinal groove at their posterior and internal surfaces, at the line of reflection of the supporting processes of peritoneum, and on each side unite to form a vas deferens, which descends along the edge of a process of peritoneum external to the kidneys, and finally opens into the termination of the rectum, as in the Amphiume. The kidneys are opake white bodies, which, beginning by small extremities near the lower end of the testes, slightly enlarge as they descend to the cloaca. The injected aorta occupies their posterior interspace, and there sends off the arteries for the hinder extremities. (*Catalogue*, vol. ii.)

Siren lacertina grows to the length of three feet: its colour is blackish. The feet have four toes, and the tail is compressed into an obtuse fin.

This Siren inhabits the marshy grounds of Carolina, especially those where rice is cultivated. It lives in the mud, from whence it makes excursions, sometimes on land and sometimes in the water. From the swampy places by the sides of pools and under the overhanging trunks of old trees where it is found, it was called by the inhabitants 'the Mud Iguana.' Garden was of opinion that it feeds on serpents, and that it uttered a cry similar to that of a young duck; but Barton contests these statements. Its food is generally believed to consist of earth-worms, insects, ex. There is now (Sept., 1841) a fine living specimen in the parrot-house in the garden of the Zoological Society in the Regent's Park. It is kept in a vessel of pond-water with a deep bottom of mud, in which it hides itself, and is twenty inches long, as large as the wrist of a small child of six months old, and very eel-like in its movements and appearance. About a dozen and a half of earth-worms are supplied to it as food every other day.

Siren striata is blackish, with two longitudinal yellow stripes on each side; but only three toes on each foot, and is about nine inches in length.



Siren lacertina.

a, head and anterior part seen in profile, showing the branchiæ and feet.

Whilst the article was passing through the press, Professor Owen was so good as to send the following highly interesting observations on the blood-globules of the *Siren* for insertion in this work:—

'Among the important generalizations which the numerous observations of recent microscopical anatomists have enabled the physiologist to establish respecting the form and size of the blood-discs in different classes of animals the most interesting seems to be that which Professor Wagner has enunciated respecting the relation of the magnitude of the blood-disc to the persistence of the branchial apparatus in the Batrachian order of reptiles on the occasion of his description of the blood-discs of the *Proteus anguinus.*

'The absolute size of those particles in that perennibranchiate reptile, in which they may be distinguished by the naked eye, renders them peculiarly adapted for minute investigations into the structure of the nucleus and capsule of the blood-disc; but the value of the relation between their size and the persistency of the external gills must depend upon the correspondence of other perennibranchiate reptiles with the *Proteus* in this respect. The superior size of the blood-discs of the newts to those of the land salamanders and tailless Batrachians has been confirmed by Professor van der Hoeven's observations on the blood-discs of the gigantic newt of Japan (*Sieboldtia.* SALAMANDRIDÆ, vol. xx., pp. 331, 332), of which a fine specimen has been for several years kept alive at Leyden; and I have been able to add another instance of the still greater relative size of the blood-discs in the perennibranchiate reptiles by the examination of those of the largest existing species of that family, the *Siren lacertina*, of which a specimen twenty inches in length is now (October 15th) living at the Zoological Gardens. The blood was obtained from one of the external gills, and immediately subjected to examination. The blood-discs presented the elliptical form which hitherto without exception has been found to prevail among the air-breathing oviparous vertebrated animals: the ellipse was not quite regular in all the blood-discs; several were sub-ovate, a few slightly reniform and thicker at the more convex side; all were as compressed, or disc-shaped, as in other Batrachians, with the nucleus slightly projecting from each of the flattened surfaces.

'The nucleus did not partake in the same degree with those varieties of form, but maintained a more regular elliptical form; the varieties in question appearing to depend on pressure acting upon the capsule and the coloured fluid surrounding the nucleus. Yet when the ellipse of the blood-disc was, as it happened in a few cases to be, longer and narrower than the average, the form of the nucleus presented a similar modification of size.

'The following is a table of the averages of many admeasurements of these blood-discs, made with the screw micrometer*:—

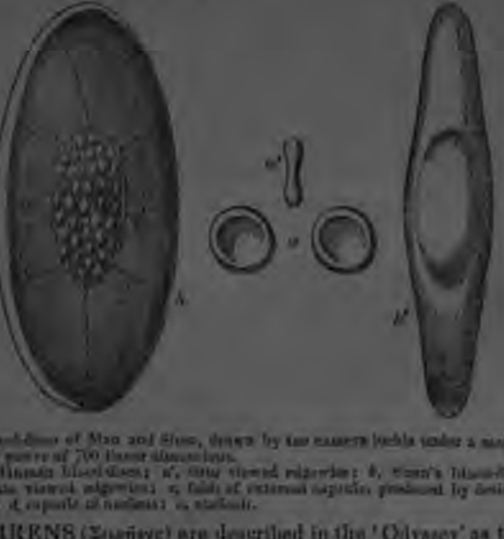
	English inch.
'Long diameter	1-420th
Short diameter . . .	1-840th to 1-870th
Long diameter of nucleus .	1-1000th
Short diameter of ditto . . .	1-2000th
Thickness of ditto	1-2800th

(as viewed edgeways covered by the capsule).

'The nucleus was circumscribed by a double line, the outer one more regular than the inner one, which appeared crenated. This appearance was due to the structure of the nucleus, or the contents of the nucleolar capsule, which was indicated by the outer line. These contents consisted, in every blood-disc examined, of a number of moderately bright spherical nucleoli, sufficiently distinct to be counted, when viewed by a Powell's 1-16th inch object-glass, with the eye-piece, magnifying 700 linear diameters: the ordinary number of nucleoli seen in one plane or focus being from twenty to thirty, the total number was of course much greater. The facility as well as certainty of the demonstration of such a structure in a good microscope of the present day will be readily admitted when it is remembered that the nucleus of the blood-disc of the Siren is three times the size of the entire human blood-disc. These tuberculate nuclei, when removed from the capsule, were colourless; the component granules or cells have a high refracting power; viewed *in situ* they present a tinge of colour lighter than that of the surrounding fluid, and dependent upon the thin layer of that fluid interposed between the nucleus and the capsule.

'The external capsule of the blood-disc is smooth, moderately resisting, elastic, as was easily seen by the flattening of the parts of two blood-discs that might come in contact, and the recovery of form when they were floated apart.

'As the fluid contents of the blood-disc in part evaporated during the process of desiccation, the capsule fell into folds in the interspace between the nucleus and the outer contour, these folds generally taking the direction of straight lines, three to seven in number, radiating from the nucleus.' (R. Owen, Sept. 23, 1841.)



Blood-discs of Man and Siren, drawn by the camera lucida under a magnifying power of 700 linear dimensions.

a, Human blood-discs; a', ditto viewed edgewise; b, Siren's blood-disc; b', ditto viewed edgewise; c, folds of external capsule, produced by desiccation; d, capsule of nucleus; e, nucleoli.

SIRENS (Σειρῆνες) are described in the 'Odyssey' as two maidens who sat by the sea and so charmed with their music all who sailed by, that they remained on the spot till they died. Ulysses, by the direction of Circe, had himself tied to the mast, and stopped the ears of his companions with wax, by which means he was able to hear their music, and escape from its influence. (*Od.*, xii. 39, &c., 169.) The ship of Ulysses, with himself tied to the mast, is frequently represented on gems, and other works of antient art. (See *Dictionary of Greek and Roman Antiquities*, p. 52.) The number of the Sirens was afterwards increased to three, and various names were given to them by different writers. They were usually called the daughters of Melpomene and Achelous (Apollod., i. 3, § 4), and were represented by artists with the feathers and wings of birds (compare Ovid, *Met.*, v. 522, &c.) They were urged by Hera to contend with the Muses, who conquered them, and tore off their wings. (Paus., ix. 34, § 2.)

---

* 'I was indebted to Mr. Stokes for the use of the one attached to his excellent microscope by Powell.'

SIRHIND, a district of northern Hindustan, which extends from 29° 27′ to 31° N. lat.; and from 73° 38′ to 77° 38′ E. long. The northern boundary is formed by the Sutlej, and the Jumna forms a part of the eastern boundary. The principal river is the Gagur. Most of the other rivers are affluents of the Gagur. Sirhind constitutes a portion of what are called the Hill States, and is inhabited by the Sikhs. [HINDUSTAN, p. 233.] The town of Sirhind, from which the district derives its name, though formerly a place of importance, is now little else than a heap of ruins.

SIRI, VITTO'RIO, born at Parma in 1625, became a priest, and afterwards went to Paris, where he found favour with Louis XIV., who appointed him his almoner and historiographer. Siri wrote a journal in Italian, entitled 'Mercurio Politico,' which he continued for many years, and as Louis acted for a long period the principal part on the political stage of Europe, he was flattered at having by him a writer who contributed to spread his fame in a foreign language. Siri however was not a fulsome flatterer, and although he often praised Louis, he did not always spare his ministers and other powerful men of that and the preceding reign, and this freedom passed unheeded chiefly from the circumstance of his writing in a language foreign to France, and which was not understood by the people in general. Besides the 'Mercurio Politico,' the collection of which consists of fifteen thick volumes, Siri wrote another journal, entitled 'Memorie Recondite,' which fills eight volumes. Le Clerc (*Bibliothèque Choisie*, vol. iv., p. 138) observes that both these works contain a vast number of valuable authentic documents. The general style of the writer is however prolix and heavy. Siri died at Paris, in 1685. (Corniani, *Secoli della Letteratura Italiana*.)

SIRI'CIUS, a native of Rome, succeeded Damasus I. as bishop of that city, A.D. 384, under the reign of Valentinian II. We have several letters by him written to various churches on matters both of dogma and of discipline. Some of them are in condemnation of the Priscillianists, Donatists, and other heretics; one is directed to Anycius, bishop of Thessalonica, on matters of jurisdiction; another to Himerius, bishop of Tarracona, which is one of the oldest instances of a bishop of Rome sending mandates to other churches to be received as ecclesiastical laws. Siricius is also one of the first bishops of Rome who wrote concerning the celibacy of the clergy. He directed that a priest who married a second wife after the death of the first should be expelled from his office. (Platina, *Lives of the Popes*; Dupin, *Nouvelle Bibliothèque, Vie de Sirice.*) The council of Nicæa had already decreed that all clerks who had been married before they took orders, should be allowed to retain their wives according to the antient tradition of the church, but that priests and deacons should not marry after their ordination. Siricius died A.D. 398.

SI'RIUS and PRO'CYON (Σείριος and Προκύων), the Greek names of the bright stars in the constellations of the Great and Little Dog [CANIS MAJOR and MINOR]. These are Orion's dogs, according to some, and those of minor personages, according to others: the whole of their mythic explanations form a strong proof, in addition to those already noticed, that the constellations are not Greek in their origin. In a passage of Hesiod he has been supposed to speak of the sun under the name of Sirius; and Hesychius defines the word to mean both the sun and the dog-star. Dr. Hutton informs us that the Egyptians 'called the Nile Siris, and hence their Osiris,' which he has copied from Sir John Hill, who derives Sirius from Siris, but does not say where he got his information: probably from some writer of his own calibre. The Egyptians called the dog-star Sothis [SOTHIAC PERIOD], and from its HELIACAL rising had warning that the overflow of the Nile was about to commence. Now the overflow of the Nile follows the summer solstice; whereas, by the precession of the equinoxes, the heliacal rising of Sirius is now about the tenth of August. This heliacal rising is a very indefinite phenomenon, and will serve any system: by it Bailly, from Bainbridge's calculations, was able to carry back the settlement of Egypt 2800 years before Christ: while Newton, by a reckoning made on the same principles, made many antient events seem later than was generally supposed.

The greatest heats of summer generally follow the summer solstice, and in the Mediterranean latitudes, and in antient times, it was observed that the unhealthy and oppressive period coincided with the heliacal rising of the dog-star. We say *the* dog-star, without specifying whether it was Sirius or Procyon; it is uncertain which it was, and may have been both, for the heliacal risings do not differ by many days. The star itself was in Latin *canicula*, which should seem to apply to the lesser dog, and Horace says—

> 'Jam *Procyon* furit
> Et stella vesani Leonis [sc. Regulus]
> Sole dies referente siccos.'

Pliny supports the same meaning of canicula, and perhaps Hyginus; also the framers of the Alphonsine Tables, and Bede and Kepler, among the older moderns: while Germanicus and Julius Firmicus, with Apian, Magini, Argoli, H. Stephens, and Petavius, among the moderns, contend for Sirius, which is the more common opinion. All antiquity attributed an evil influence to the star; and though Geminus among the antients, and Petavius among the moderns, thought that the effects were to be attributed to the sun alone, they had hardly any followers until the fall of judicial astrology. Even at this day, when the heats of the latter part of the summer are excessive, we are gravely told that we are in the dog-days; and the almanacs, in which an absurdity has the lives of a cat, persist to this very year in informing us that the dog-days begin on the 3rd of July, and end on the 11th of August. Now as the heliacal rising of Sirius takes place about the very end of this period, it is clear that the cart has got before the horse, or the mischief before the dog. Moreover it is notorious that in our island the oppressive heats of the summer, during which dogs are apt to run mad (which is what many people think the name arises from, as indeed it was antiently recorded among the effects of the star), generally fall about the middle or end of August. The real classical dog-days are the twenty days preceding and the twenty days following the heliacal rising of whichever star it was, Sirius or Procyon. It is perfectly useless to retain this period: surely these dogs have had their day.

SIRMOND, JACQUES, was born at Riom, in France, October 22, 1559. Having completed his studies at the Jesuits' college at Billom, the first which that Society had in France, he adopted the rule of St. Ignatius, and prepared himself, by a diligent study of the antient languages, for fulfilling the duties of a teacher. When he had finished his noviciate, his superiors required him to come to Paris as professor of rhetoric, in which city he remained till 1790, when he repaired to Rome, on the invitation of the Père Aquaviva, General of the society of Jesuits, who chose Sirmond as his secretary. In this employment he continued sixteen years, during which he examined diligently the manuscripts in the Vatican library, as well as the inscriptions and other remains of antiquity, of which Rome possessed such an abundant supply.

In 1608 the Père Sirmond returned to Paris, and soon afterwards commenced a visitation of the libraries and archives of the convents, and was thereby enabled to save from destruction a great number of documents of the highest value for the history of the middle ages. Sirmond's first publication was the 'Opuscules' of Geoffroi, abbé de Vendôme, in 1610; from which time he continued to add to his reputation by other publications almost every year. Pope Urban VII. invited him to return to Rome, but Louis XIII. retained him in France, and in 1637 made him his confessor.

The Père Sirmond, having left the court on the death of Louis XIII. in 1643, recommenced his literary labours, which had been somewhat interrupted by attention to the duties of his late dignified office, and continued with unabated ardour to occupy himself in the same way till his death, October 7, 1651, when he was 92 years of age.

Sirmond's 'Ouvrages' were collected and published in 1696, in 5 vols. folio. The first three volumes contain the 'Opuscules' of those Fathers and other ecclesiastical writers which had been published by Sirmond, with prefaces and tion; the fourth volume contains his Dissertations; and the fifth volume contains the works of Theodore Studita. The edition of Sirmond's Works is by the Père la Baume, and is preceded by a Life of Sirmond by the editor, his Funeral Oration by Henry de Valois, and a list of Sirmond's Works in manuscript as well as printed. In this edition are included the Works of Ennodius bishop of Pavia, of Sidonius Apollinaris, of Eugenius bishop of Toledo, the Chronicles of Idatius and Marcellinus, the Collections of Anastasius the Librarian, the Capitularies of Charles the Bald and his successors, the works of St. Avit, of Theodulphe bishop of Orleans, &c. Father Sirmond published other ecclesiastical writers besides those included in the above edition, among which are 'L'Histoire de Reims,' by Flodoard, the 'Lettres de Pierre de Celles,' the 'Œuvres' of Rathier, of Geoffroi, of Hincmar archbishop of Reims, &c. Sirmond published also a Collection of the Councils of France, 'Concilia Antiqua Galliæ,' Paris, 1629, folio.

(*Biographie Universelle.*)

SIROCCO. [Winds.]

SISIN'NIUS, a Syrian by birth, succeeded John VII. as bishop of Rome, A.D. 707, and died twenty days after his election. He was succeeded by Constantine.

SISON, the name of a genus of plants belonging to the natural order Umbelliferæ. It possesses the following characters:—calyx obsolete; petals broadly cordate, deeply notched, and curved with an inflexed point; styles very short; fruit ovate, laterally compressed; carpels with five filiform equal ridges, of which the lateral ones are marginal; interstices with single, short, club-shaped vittæ; seed gibbous, convex, plane in front; universal and partial involucre of few leaves.

Several species were formerly referred to this genus which are now placed under various genera. The only species that is now decidedly referred to Sison is the *S. Amomum*, hedge bastard stone parsley. It is a native of France, Sicily, Italy, Greece, and Great Britain. It is not unfrequent in this country, especially in chalk soils in rather moist ground, under hedges, &c. It is known by its erect, terete, paniculately branched stem; pinnate leaves, the lower leaflets being toothed and lobed, upper ones cut into narrow segments. The flowers are cream-coloured. The green plant when bruised has a peculiarly nauseous smell, something like that of bugs. The seeds are pungent and aromatic, and were formerly esteemed as a diuretic, but are now little used.

SISSOO, a tree well known throughout the Bengal presidency, and highly valued on account of its timber. It is common chiefly in the forests and beds of rivers which extend all along the foot of the Himalayas up to 30° N. lat. The trunk is generally more or less crooked, lofty, and often from three to four feet in diameter. The branches are numerous and spreading; the leaves pinnate, with 5 alternate roundish acute leaflets, which from their small size and drooping nature give the tree a very light and elegant appearance.

The Sissoo yields the Bengal shipbuilders their crooked timbers and knees. Dr. Roxburgh describes it as being tolerably light, remarkably strong, but not so durable as would be wished; the colour is light greyish-brown, with dark veins: he says that upon the whole he scarcely knows any other tree more deserving of attention, from its rapid growth in almost every soil, its beauty, and uses. Captain Baker, in his 'Experiments on the Elasticity and Strength of Indian Timbers,' describes the Sissoo in structure somewhat resembling the finer species of teak, but as being tougher and more elastic, and as employed by the natives for [illegible] furniture, beams, checks, spokes, naves and felloes of wheels, boats and frames of boats, blocks, and printing presses. It is universally employed both by Europeans and natives of the north-west provinces where strength is required.

The Sissoo belongs to a genus Dalbergia, which abounds in valuable timber-trees, as *D. latifolia*, which is usually called Blackwood tree by the English, and of which the wood is exported as a kind of ebony; sometimes also called Black Rosewood. It is one of the largest timber-trees of India, being 15 feet in circumference, with the wood of a greenish-black colour, with lighter-coloured veins running in various directions, and admitting a fine polish, and therefore much admired as furniture-wood. Captain Baker found it, like the Sissoo, able to sustain a weight of 1442 pounds, when teak broke with 1125 lbs. *D. Dalbergia Ougeinensis*, found in central India, is also highly valued for timber; the pillars of Scindia's palace at Oujein are made of it.

SISTERON, the chief town of an arrondissement in the department of Basses Alpes in France, on the right bank of the Durance, at the junction of the Buech, 447 miles from Paris by Lyon, Grenoble, and Gap. Sisteron was known to the Romans by the name of Segustero (*Itinerarium Antonini*, and *Peutinger Table*) or the town of the Segusteri (*Notitia Provinciarum*); afterwards altered into Segesterorum, Sisteronum, and Sisteron. It is not known to what people it belonged. In the sixth century it became the seat of a bishopric, and was the object of attack in the ninth century to the Saracens and the Hungarians. The townsmen embraced the Huguenot party in the religious contests of the sixteenth century. The Catholics in consequence attacked the town and took it, A.D. 1562; but it was afterwards retaken by Lesdiguières. The town is calculated to be 479 metres, or 1570 feet, above the level of the sea. It is situated at the foot of a rock, upon which is an old citadel, and is surrounded by an embattled wall flanked with towers, but is commanded by the surrounding heights, so as to be little defensible in modern warfare. There are two bridges, one of a single arch over the Durance, the other over the Buech. The ex-cathedral has a fine altar-piece by Vanloo; there are two other churches, an hospital, and a prison. The population in 1831 was 3957 for the town, or 4479 for the whole commune. The townsmen manufacture hats, leather, and pottery; there are lime-kilns; and trade is carried on in almonds, wool, oil, and truffles; there are ten yearly fairs. The surrounding country produces a great quantity of walnuts and almonds, and some good wine. Urns, vases, lamps, medals, and other Roman antiquities have been dug up here.

SISTRUM, a musical instrument of percussion, of the highest antiquity, constructed of brass, and shaped like the frame and handle of a racket, the head part of which had three, and sometimes four, horizontal bars placed loosely on it, which were tuned, most probably, by some scale, and allowed to play freely, so that when the instrument was shaken, piercing, ringing sounds must have been produced. Some writers have confounded the sistrum with the cymbals, though the instruments could have had nothing in common except their harsh metallic sounds.

SISY'MBRIUM (from Σισύμβριον), the name of a genus of plants belonging to the natural order Cruciferæ. It possesses a roundish siliqua seated upon a torus; two stigmas, somewhat distinct, or connate into a head; calyx equal at the base; ovate or oblong seeds; flat, incumbent, sometimes oblique cotyledons; stamens not toothed. The species are mostly perennial or annual herbs, with yellow or white flowers, and leaves very variable on the same plant. About fifty-eight species are enumerated, but comparatively few of these are cultivated. The genus however belongs to an order that possesses no injurious plants, and a few of the species are well known on account of their uses.

S. officinale, Common Hedge-Mustard, has runcinate pilose leaves, a pilose stem, and subulate pods pressed to the rachis. It is a native of Europe, and grows in waste places and way-sides, among rubbish, and along the sides of walls. It is plentiful in Britain, and also the north of Africa. The whole plant is warm and acrid, and is often cultivated for use as a pot-herb. It is eaten by sheep and goats; but cows, horses, and swine refuse it. In medicine it was formerly much used as an expectorant in chronic coughs and asthma. It was also recommended in ulcerations of the mouth and throat. The stimulant properties of this and other plants belonging to the order would make them undoubtedly valuable remedies in many diseases in the absence of other means, but in modern medicine more powerful and certain remedies have thrown into disuse many agents formerly highly valued.

S. Irio, London Rocket or Broad-leaved Hedge Mustard; stem and leaves smooth; leaves runcinate; lobes toothed; pod erect. It is a native of waste places throughout Europe, but especially about London. It is said to have entirely covered the ground in the following spring of the great fire of London in 1666. The former species is also remarkable for appearing on the ground where fires have existed. In such cases the ashes of the fires constitute a nutriment peculiarly adapted for the growth and development of these plants. The whole of this plant possesses the hot biting character of the mustard. Several varieties have been recorded.

S. Sophia, Five-leaved Hedge-Mustard, or Flixweed: leaves doubly pinnatifid, slightly hairy; lobes linear or oval; pedicels four times longer than the calyx; petals shorter. It grows on dry banks, waste ground, dunghills, and among rubbish in most parts of Europe. It is frequent in Great Britain. It has derived its name of flixweed and that of 'wisdom of surgeons' from its supposed power of controlling diarrhœa, dysentery, &c. Whatever may have been its former reputation, it is now almost entirely fallen into disuse.

S. millefolium, Millfoil-leaved Flixweed: leaves somewhat tripinnate, hoary; lobules blunt, small; stems shrubby; petals larger than the calyx. A native of Teneriffe, on the rocks in the lower parts of the island. It is a small branched shrub, with corymbose flowers. It is a greenhouse species, growing well in a rich light soil; and young cuttings will readily root under a hand-glass when placed in a sheltered situation.

S. strictissimum, Spear-leaved Hedge-Mustard: leaves lanceolate, stalked, toothed, pubescent. It has intensely yellow flowers, with pods two inches long; the stem is erect, and branching at the top. It is a hardy perennial, adapted for shrubberies, and may be easily increased by division of the root.

This genus at one time included that now known under the name of *Nasturtium*. The latter was originally separated by Brown, and is principally distinguished by the position of the cotyledons, a point of primary importance in the whole order of Brassicaceæ. In Sisymbrium the cotyledons are folded with their back upon the radicle, whilst in Nasturtium their edges are presented to it; in the former the cotyledons are said to be incumbent, in the latter accumbent.

A well known species of *Nasturtium* is the *N. officinale*, formerly *Sisymbrium Nasturtium*, the common water-cress. In addition to the characters of the genus, this plant is known principally by the form of its leaves. The leaf is composed of from 5 to 7 leaflets, which are arranged opposite each other on a common petiole with a terminal leaflet. The leaflets are somewhat heart-shaped and slightly waved and toothed; they are succulent, and their surface is smooth. The terminal leaflet is always largest. The upper leaves do not separate into distinct leaflets, being pinnatifid with narrow segments. The petiole of the leaf does not in any manner embrace the stem. The flowers are white, and the pods, when ripe, are about an inch long. This plant is a native of rivulets throughout the world, and is very plentiful in Great Britain. It has a warm agreeable flavour, and has long been one of the most popular plants as a salad. It was formerly much used in medicine as a diuretic and antiscorbutic, but its great consumption now is as an article of diet. As it frequently grows amongst plants that are not wholesome, and that bear to it a general resemblance, it would be well for every one to be acquainted with its characters. The plant most frequently mistaken for it, especially when out of flower, is the fool's water-cress. [SIUM.] From this it may be always distinguished, and in fact from all other Umbelliferæ, by the petioles of the leaves not forming a sheath round the stem.

The water-cress is cultivated to a very great extent in the neighbourhood of London. The plants are placed out in rows in the bed of a clear stream in the direction of the current, and all that is required for their successful growth is replanting occasionally and keeping the plants clear of mud and weeds; sandy and gravelly bottoms are best. 'Some market-gardeners who can command only a small stream of water, grow the water-cress in beds sunk about two feet in a retentive soil, with a very gentle slope from one end to the other. Then, according to the slope and length of the bed, dams are made six inches high across it, at intervals, so that when these dams are full, the water may rise not less than three inches on all the plants included in each. The water, being turned on, will circulate from dam to dam, and the plants, if not allowed to run to flower, will afford abundance of young tops in all but the winter months.' (G. Don.) Water-cresses grown in this way have not so fine a flavour as those from natural streams.

SITKHA is the name of the most important of the Russian settlements on the west coast of North America, though its proper name is New Arkhanghelsk. This place lies in 57° 2′ 50″ N. lat. and 135° 18′ W. long., and is built on one of the group of islands which received from Vancouver the name of King George III.'s Archipelago. The outward coast of this extensive group had been seen before by Cook in his third voyage, who called a very elevated island, which had the appearance of a cape, Mount Edgecombe, but he afterwards suspected that it was an island. The space between this small island of Edgecombe and the larger island which lies east of it, forms the harbour of the settlement. When Vancouver surveyed this coast, he thought that the outward coast, which extends from Chatham Sound on the south (56° N. lat.) to Cross Sound (58° N. lat.) on the north, constituted one large island, which he called King George III.'s Island; but it was afterwards ascertained that it was divided by a narrow strait into two islands, and since that time the northern island has been called by the native name of Sitkha, while the southern has received the name of Baranoff Island, in honour of the founder of the Russian settlement. On the last-mentioned island Baranoff built a small fort in 1799, which was destroyed in 1802 by the natives of the tribe of the Koloshes. But in 1804 Baranoff expelled them from the strait which constitutes the harbour of New Arkhanghelsk, and founded in the vicinity of one of their villages the present town. The harbour, which Vancouver named Norfolk Sound, but which is now better known as the Bay of Sitkha, is spacious and safe, and offers excellent anchorage opposite the settlement. The place itself is surrounded by a wooden wall, and enclosed by mountains of considerable elevation, which are almost covered with forests, in which excellent timber is found. Ship-building constitutes the most important of the branches of industry, and all the vessels of the American Company are now built at this place, since ship-building has been discontinued at Okhotsk. New Arkhanghelsk is the centre of the administration of the Russian territories in America, over which the American Company exercises sovereign powers, nearly in the same way as the Hudson's Bay Company over a much more extensive portion of North America. The collecting of furs is the exclusive object of both companies, and New Arkhanghelsk may be compared with Fort York, which lies nearly under the same latitude on the eastern coast of America. But New Arkhanghelsk is larger: its population in 1833 amounted to 847 individuals, of whom 406 were Europeans, and 307 descendants of Europeans and native women, and 134 only Aleutes and Koloshes. New Arkhanghelsk has also a much greater commerce by sea, and the vessels of the Company visit California, whence they import grain and salt, and dried meat; and the Sandwich Islands, where they obtain salt for curing their fish. The number of vessels employed by the Company in this commerce and in the transport of the furs which have been collected in the different smaller settlements amounts to twelve; their tonnage is stated not to exceed (1833) 1565 tons.

Wrangell continued to make meteorological observations during his stay at New Arkhanghelsk (1833 and 1835), and Baer has taken advantage of his work to compare the climate of Nain on the coast of Labrador with that of Sitkha. The result is contained in the following table, which expresses the mean temperature of the seasons and of the year:—

	New Arkhanghelsk.	Nain.
Winter (Dec.—Feb.)	+34·74	−1·26
Spring (March—May)	42·28	+22·38
Summer (June—Aug.)	56·30	45·62
Autumn (Sept.—Nov.)	47·89	36·00
Annual mean temper.	+45·30	+25·50

Thus it appears that the mean annual temperature of these two places, situated respectively on the eastern and western coasts of North America, differs nearly 20 degrees of Fahrenheit; in winter the difference amounts to 36 degrees, and in summer to nearly 11½ degrees. But though these observations prove the great superiority of the western coast of North America over the eastern in respect to climate, a comparison between Sitkha and Bergen in Norway shows that the western coast of the old continent is much more favoured by nature. For though Bergen is 3 degrees and 20 minutes nearer the pole, the mean temperature of the winter is +36°, of the spring +45°, of the summer +56°, and of the autumn +48°, and the mean annual temperature nearly 47°. The climate of the last-mentioned place may also in other respects be compared with that of Sitkha, especially in regard to humidity. Sitkha however is certainly more humid; for in 1828 there occurred 120 days in which rain fell without interruption, and 120 days in which showers were frequent, so that only 66 days were free from rain. Snow is frequent during three or four months, but it does not lie long on the ground. It is considered rare if the frost continues for two days together. It is to this great degree of humidity that the failure of all attempts to cultivate grain is attributed; for there are many other places in which it succeeds, and in which the mean temperature of summer is from 8° to 10° lower. The prevailing winds are from the south-east and the south-west. Thunder-storms occur only in November and December, and never in summer.

SITKOFF. [Jassy.]

SITTA. [Nuthatch.]

SITTINGBOURNE. [Kent.]

SIUM, the name of a genus of plants belonging to the natural order Umbelliferæ. The calyx possesses 5 teeth or is obsolete; petals obcordate with an inflexed point, or entire and ovate; fruit laterally compressed or contracted, and didymous, crowned with the reflexed styles with their depressed bases; carpels with 5 equal, filiform, rather obtuse ridges, of which the lateral ones are marginal; interstices with one or many vittæ; seed subterete. The universal involucre various, the partial one is composed of many leaves.

S. Sisarum, Skirret, is the best-known plant of this genus. The root is composed of fascicles of fusiform tubers; stem erect; leaves pinnate, upper ones ternate, leaflets oval-lanceolate, acute, serrated; involucre of 5 reflexed leaves, unequal, according to Koch, with 3 vittæ. It has white flowers. The tubers of the root are about the size of the finger, and were formerly greatly esteemed in cookery, but are now gone much into disuse. The French call this plant *Chervis*, the Germans *Zucker wurzel*, and in the north of Scotland, where it is much eaten when cooked, it is called *crummock*. When eaten, the tubers are boiled and served up with butter, forming, according to an old writer, 'the sweetest, whitest, and most pleasant of roots.'

The Skirret is a native of China, and is reputed to possess in that country peculiar medicinal virtues. Sir J. E. Smith suggests that the Chinese have long been in the habit of sending this root to Japan as the true Ginseng of Tartary, the *Panax quinquefolium* of Linnæus, a plant possessing very different properties.

The Skirret may be propagated by seeds and offshoots. The seeds should be sown in the months of March and April, in small drills eight inches apart, in an open space of lightish ground. When the plants are one or two inches high, they should be thinned, and they may be used as they attain size till August, September, or October. Plants of the last year will always afford offsets, which may be broken off the old roots and planted in rows. For procuring seed the plants should be left till the following autumn.

S. nodiflorum, Fool's Water-cress, or procumbent Water-parsnip, possesses a trailing, procumbent, striated stem; pinnate leaves, oblong equally serrated leaflets; umbels sessile, opposite the leaves. It is a native of Europe, in ditches and rivulets, and is common in Great Britain. A small and large variety are recorded, the one not attaining more than three or four inches in height, the other as many feet. It was formerly admitted into the 'London Pharmacopœia,' on account of its efficacy in cutaneous diseases and scrofula. Dr. Withering has recorded his opinion in its favour, and related a remarkable case in which benefit was derived from its use. He administered three or four spoonfuls of the juice in milk daily. This plant has often been represented as very poisonous; but if thus much of the juice can be taken with impunity, it can hardly be very active. This with some other species of Sium, has been placed by Koch under a new genus, *Helosciadium*. The principal difference consists in the number of vittæ found in the interstices of the carpels; *Sium* having several vittæ, *Helosciadium* only one.

There are many other species of Sium, four of which are British, but none of them are cultivated for their beauty or applied to any particular uses.

SIVA, the personification of the destroying principle, forms, with the two other gods Brahma and Vishnu, the Trimúrti, or triad, of the Hindus; and although, in allusion to his office as destroyer, he is named third, yet he is generally allowed to occupy the second place among the Hindu deities, or even (according to Kindersley) the first, as his supremacy appears to have obtained more general assent than that of Vishnu. Indeed the worship of Siva is so predominant, that Brahma, who is the only one of the three mentioned by Manu, and who seems to have enjoyed a larger share of adoration in antient times, has now only one temple in India, while Mahádeva (a name of Siva) and the adventurous Vishnu, whose incarnations attract so much of the veneration of the Hindus, are, in fact, the only gods of the whole Hindu pantheon who have numerous worshippers. This however is no proof that Siva or Vishnu dates from a later period. The personification of the three divine attributes originates, no doubt, with the Vedas, and the names of the three gods are mentioned, though rarely, and without the least allusion to their pre-eminence over the elemental gods or over each other; but we do not find that the two great sects of India, the Vaishnavas (followers of Vishnu) and the Saivas (worshippers of Siva) came into existence before the seventh or eighth century of our era. It is therefore to the Puránas (the scriptures of the modern Hindu religion) that we must ascribe the extension of the worship of Siva and the character which now distinguishes this god. We cannot however point out the difference between the mode of worshipping Siva now and in the time of Manu, the Vedas being too little known, and the extracts from them, which have been hitherto published, unsatisfactory. We must therefore limit ourselves to the description of the present popular form of Siva worship, which in all probability had not assumed its actual state before the great Saiva reformer, Sankara Acharya, who lived in the eighth or ninth century. (*Vishnu Purána*, pref., p. xi.) This opinion is supported by the well-founded assertion that the Saiva faith was instituted by Paramata Kálánala, who is described in the '*Sankara Vijaya*' of Ananda Giri as teaching at Benares, and assuming the insignia that characterize the Dandis, a sect of Saivas of modern times. (*As. Res.*, xvi. 22.) No allusion is made in the Puránas to the original power of this god as destroyer; that power not being called into exercise till after the expiration of twelve millions of years, when, according to Pauranic accounts, the Kaliyuga will come to a close together with the universe; and Mahádeva is rather the representative of regeneration than of destruction. Indeed the worship of the type which represents him as the vivifying principle, the *linga* (phallus, a smooth black stone in the form of a sugar-loaf, with a projection at the base like the mouth of a spout) is spread all over India, and the number of worshippers of this image is far greater than the worshippers of all the other gods. (Ward, i. 16.) There are however a few legends in Hindu mythology in which Siva appears as the actor without any reference to the worship of the *linga*. The linga is indeed the only form under which Siva is now adored in most parts of India. According to Professor Wilson (*Vishnu Purána*, xliv.), 'There is nothing like the phallic orgies of antiquity; it is all mystical and spiritual. The linga is twofold, external and internal. The ignorant, who need a visible sign, worship Siva through "a mark" or "type," which is the proper meaning of the word "linga," of wood or stone; but the wise look upon this outward emblem as nothing, and contemplate in their minds the invisible inscrutable type, which is Siva himself. Whatever may have been the origin of this form of worship in India, the notion upon which it was founded, according to the impure fancies of European writers, is not to be read even in the Saiva Purána.' Indeed the emblems under which the Hindus exhibit the elements and operations of nature are not indecorous, and the low cylinder of stone, which is meant for the symbol of the creative power, suggests no suspicion of its original import; and nothing whatever belongs to the worship of the linga, or to the terms in which this is mentioned, which has the slightest tendency to lead the thoughts from the contemplation of the god to an undue consideration of the object by which he is typified. The best refutation however of the injurious suppositions to which the accounts of many travellers have given rise, will be the words which Siva himself is supposed to say in the Saiva Purána: 'From the supreme spirit proceed Purusha (the generating principle), Prakriti (the generative nature), and Time; and by them was produced this universe, the manifestation of the one god. . . . Of all organs of sense and intellect the best is mind, which proceeds from

Ahankâra;* Ahankâra, from intellect; intellect, from the supreme being, who is in fact Purusha. It is the primeval male, whose form constitutes this universe, and whose breath is the sky; and though incorporeal, that male am I.' This doctrine is pure enough, and the few aberrations which remind one of the orgies practised in honour of Bacchus, are not sufficient to justify us in stigmatizing it as vile and infamous.

The linga however is only the type of Siva as the god who presides over generation. His other forms are many, and they vary in so far as they attribute to him the qualities of creator, preserver, destroyer, and regenerator, and represent him in his various *avatâras* (incarnations, eight of which are called by the common name of Bhairava, and are severally termed Asitânga, Ruru, Chandra, Krodha, Unmatta, Kûpati, Bhîshana, and Sanhâra, all alluding to terrific properties of mind or body. He is sometimes seen with two hands, at others with four, eight, or ten, and with five faces; he has a third eye in his forehead, the corners of which are perpendicular, which is peculiar to him; a crescent in his hair, or on his forehead, encircling the third eye; he wears earrings of snakes, and a collar of skulls. Mahâdeva, when represented thus, but with one head, has four hands, in one of which he holds a pâsa, the use of which is to extract the souls out of the bodies of men, when their time is come, and is a common attribute of Yama, the god of death (*S. Sâvitryupakhyana*, ed. Bopp., p. 25), a tris'ula is upheld by the other, and the two other hands are in a position of benediction. As Bhairava (the lord of dread) he is frightful to behold; great tusks burst through his thick lips; the hair, which is stiff and erect, gives his face a dreadful aspect; the fall of the necklace is impeded by numerous snakes which twine round his body. This is also the idol which shows him as Mahâ-kâla, or god of time. It is in this character that he is supposed to delight in bloody sacrifices, and that the Saiva Sannyâsis (followers of Siva who practise the yoga to the highest degree) inflict on themselves the cruelties which have rendered so conspicuous the temple of Jaggernaut (Jagannâtha, the lord of the world). [YOGA.] A very minute account of the fortitude and self-denial of the deluded Yogis is given in Ward's 'View on the Religion of the Hindus' (i. 19). His consort Sakti, who in her corresponding character is celebrated as the goddess Durgâ or Kâlî, participates in these horrible sacrifices, and has lately become more notorious by the exposure of the homicidal practices of the Thugs, who recognise in her their tutelary divinity. Siva is also the god of justice. In that character he rides a white bull, the symbol of divine justice (Manu, viii. 16), and is often seen with the *parashu* (battle-axe) in his hand, and the sacred string. On pictures he is often represented as if rubbed over with ashes, and with a blue neck; the epithet of Nîlakanta (blue-necked) was given to him in commemoration of his having drunk the poison which arose from the sea, and threatened to destroy mankind. But the character in which he is more generally known, and which his followers imitate, is that of the Kapâla-bhrit (skull-bearer). Skanda-Purâna makes him describe himself in the following words:—'Pârvatî (his bride) must be foolish to practise so severe a penance in order to obtain me, Rudra (one of his 1000 names), a wandering mendicant, a bearer of a human skull, a delighter in cemeteries, one ornamented with bones and serpents, covered with ashes and with no garments but an elephant's skin, riding on a bull, and accompanied by ghosts and goblins.' Now this, except that the unearthly beings who follow him are represented by a crowd of dirty people, is exactly the description of a Saiva digambara (sky-clad, *i.e.* naked—a kind of religious mendicants), if, instead of the god's third eye, we add a round dot on the nose, made of clay or cow-dung, and a mark on the forehead, composed of three curved lines, instead of the *chandra* (half-moon) which Rudra obtained at the churning of the ocean. When asked for the reason why they and their god carry a human skull, they refer to the Vâmana-Purâna: 'Formerly, when all things moveable and immoveable had been destroyed, and nought remained but one vast ocean; while universal darkness reigned, that lord who is incomprehensible and subject to neither birth nor death reposed in slumber on the abyss of the waters for a thousand divine years; but when his night had passed, desirous of creating the three worlds, he, investing himself with the quality of impurity, assumed a corporeal form with five heads. Then also was produced from the darkness another form, with three eyes and twisted locks, and bearing a rosary and trident. Brahma next created *Ahankâra* (self-consciousness), which immediately pervaded both Siva and himself, and under its impression Rudra thus said to Pitâ-Mahâ:—"Say, O lord! how camest thou here, and by whom wert thou created?" Brahma replied, "And whence art thou?" and instantly caused the new-made sky to reverberate with a wondrous sound. Sambhu (Siva) was thus subdued, and stood with a countenance downcast and humbled, like the moon in an eclipse, and the fifth head of Brahma thus addressed him rendered red-dark with anger at his defeat:—"I know thee well, thou form of darkness! with three eyes, clothed with the four quarters of the sky (*i.e.* naked), mounted on a bull, the destroyer of the universe." On hearing these words Sambhu became incensed with anger, and while he viewed the head with the terrible glances of his world-consuming eye, his five heads, from his wrath, grew white, red, golden, black, and yellow, and fearful to behold. But Brahma, on observing these heads glowing like the sun, thus said:—"Why dost thou agitate thyself and attempt to appear powerful? for, if I choose, I could this instant make thy heads become like bubbles of water." This heard, Siva, inflamed with anger, cut off with the nail of his right hand the head of Brahma which had uttered such fierce and boasting words: but when he would have thrown it on the ground, it would not, nor ever shall it, fall from his hand.' The beautiful idea which is obscured by the extravagances of this passage, namely, that the creation in itself involves subsequent destruction, need hardly be pointed out. In nearly all the representations of Siva, the Ganga (Ganges) is seen either flowing from his head or beaming on his head-piece. There is an interesting fable which makes it flow from Pârvatî's fingers, but for which we refer our readers to Moore's 'Hindu Pantheon' (p. 41).

The origin of the linga worship is, we find, differently accounted for in different Purânas. The 'Linga-Purâna,' which contains 11,000 verses (*Mackenzie Coll.*, i. 39), states that the primitive linga is a pillar of radiance in which Mahâdeva is present. The appearance of the great fiery linga takes place, in the interval of a creation, to separate Vishnu and Brahma, who not only dispute the place of supremacy, but fight for it, when the linga suddenly springs up, and puts them to shame: after travelling upwards and downwards for a thousand years in each direction, neither of them can approach its termination. Upon the linga, the sacred monosyllable *Om* is visible, and the Vedas proceed from it, by which Brahma and Vishnu become enlightened, and acknowledge the superior might and glory of Siva (*Vishnu-Purâna*, xliii.). This legend, by which, in its Tamul version, the circumstance of Brahma having neither temple nor worshippers is accounted for, is given in Kindersley's 'Specimen of Hindu Mythology' (p. 21). In his travels in search of the head of the column, Brahma is said to have found a Cauldairy flower which Siva had purposely dropt from his head. He entreated it to bear false witness for him, that he had actually found the top of the column. The flower rashly consenting to the fraud, both returned to Siva, and asserting the falsehood agreed on, Siva, in his just resentment, decreed that Brahma should never receive any external worship. A very fanciful story about the linga is given in the 4th volume of the 'As. Res.,' p. 368; and another, which Abbé Dubois states to be derived from the 'Lainga,' but which, in fact, is from the 'Padma-Purâna,' may be found in this author's 'Moeurs, &c. des Peuples de l'Inde,' vol. ii., p. 417. But the pure, original, mystical idea, which must undoubtedly have been expressed in the Vedas, is poorly preserved in the Purânas, and almost entirely lost in the daily worship of the present Hindus, who, although without any admixture of obscene thoughts, adore their stone, or the image which they make themselves from the clay of the sacred river where they perform their ablutions, in much the same way as an African venerates his fetish. Siva, who as the type of the regenerating principle is also that of fire, which quality is represented by a triangle with the apex upwards (Δ), is the object of a very ludicrous ceremony when the heat is great. Fearing lest he should set on fire the whole world, they put above his idol a basin full of water with a small aperture at the bottom, in order that the water which drops on him may moderate his ardour. (Dubois, ii., 304.) We need not wonder if the linga worship has given rise to sects whose practices are far from admitting

---

* Literally the 'I-Maker' is the Hindu term for the power of self-consciousness, or, what is implied by this, individuality; for further information see YOGA.

[illegible] equal. There is, according to Dubois (i. 154), a sect called *Lingawanta*, who reject altogether the authority of the Vedas and the other sacred works of the Hindus, who deny the distinction of caste, maintaining that the linga renders all men equal; even a Vaisya, who embraces this doctrine, is, in their opinion, equal to a Brâhmana. They state that where the linga exists, there is also the throne of the deity, without distinction of ranks and persons; and that the humble hut of the labourer where this sacred sign exists is much above the sumptuous palace where it is not to be found. This doctrine, which is in direct opposition to the customs of the Hindus, has never had many followers.

To continue the account of his adventures: Siva marries Pârvati, and lives with her in the midst of the eternal snows of Mount Kailasa. His heaven is however one of the most splendid in Hindu mythology, and a description of it may be found in Ward's 'View' (i. 50); it is a translation from the Kriya Tattwa. There also are his two sons; Ganesa, the leader of the heavenly choristers, and, as Vigneswara, the god of difficulties, whose head is that of an elephant; and Kartikeya, the six-faced god of war. It is there that he was thus addressed by Brahma and the other gods:—'I know that thou, O Lord, art the eternal Brahm, that seed which, being received in the womb of thy Sakti (aptitude to conceive), produced this universe; that thou, united with thy Sakti, dost in sport create the universe from thy own substance, like the web from the spider.' Here it was that he reduced to ashes the 'flowery-bowed mind-bewitcher' Kâma (the god of love), pierced by whose arrows he had neglected to avenge the wrong done to him and his consort by his father-in-law Daksha. On the top of Kailasa it is that the worshippers of Siva will be admitted to the sports of the inhabitants, where Mahâdeva invented for the amusement of his bride the heavenly dance, in which his faithful attendant Nandi plays the musical accompaniment. There he tethers [illegible] his vehicle, the white bull, and the tiger on which his consort rides. Though wanting all the splendours of the Swarga (Indra's heaven), the abode of Siva, when drawn in the glowing colours of the East, is no less gratifying. 'From thence he is supposed to bless his worshippers,' when, with Pârvati on his knees, he, the lord of the world, on whose brow shines the moon throwing its beams over the mountain of the north, deigns to allow the Suras and Asuras (gods and demons) to wear for their frontal ornament the reflection of the radiance of the nails of his feet, and the Ganga, rushing from the top of his head, refreshes the air of his sacred dwelling. (*Kathá Sarit Ságara*). This is a favourite subject among the Hindu painters, and we must allow that their conception of it is generally good and well executed.

The religious service is the same as that which is used at the worship of Siva under his other names. In performing the linga pûja, for that is the Sanscrit name for sacrifice or worship, all its various parts are performed in due order. The directions for it may be found in the Lainga-Purâna (i. 23), translated by Kennedy (p. 306):—'Having bathed in the prescribed manner, enter the place of worship; and having performed three suppressions of breath [YOGA], meditate on that god who has three eyes, five heads, ten arms, and is of the colour of pure crystal, arrayed in costly garments, and adorned with all kinds of ornaments: and having thus fixed in thy mind the real form of Maheswara, proceed to worship him with the proper prayers and hymns. First sprinkle the place and utensils of worship with a bunch of kusa grass dipped in perfumed water, repeating at the same time the sacred monosyllable *Om*, and arrange all the utensils and other things required in the prescribed order; then in due manner, repeating the proper invocations, prayers, and hymns preceded by the sacred word *Om*, prepare the offerings. For the *Padyam* they should consist of Ushiram (root of the Andropogon muricatus), sandal and similar sweet-smelling woods, &c. Having then with due rites prepared a seat, invoke with the prescribed prayers the presence of Parameswara, and present to him the *padyam*, the *âchamaniyam* and *arghya*. Next bathe the linga with perfumed water, the *panchagavyam* (five products of the cow), clarified butter, honey, the juice of the sugar-cane, and, lastly, pour over it a pot of pure water consecrated by the requisite prayers. Having thus purified it, adorn it with clean garments and a sacrificial string, and then offer flowers, perfumes, frankincense, lamps, fruits, and different kinds of prepared eatables and ornaments. Thus worship the lingam with the prescribed offerings, invocations, prayers, and hymns, and by circumambulating it, and by prostrating thyself before Siva represented under this symbol.' For an explanation of the technical terms here employed, we refer to Dubois (i. 199).

The Purânas which the worshippers of Siva are most acquainted with, and which have more or less of a Saiva bias, are the *Matsya*, *Kaurma*, *Saiva*, *Lainga*, *Skânda*, and *Agneya*, to all of which the term of Tâmasa, or works of darkness, is given. The Padma-Purâna contains the thousand names of Siva at length, and is better known than the others. None of them however have yet been published, and the reader will have to judge of the general tendency of these works from the extracts that we have given. It is remarked that they are not so popular as the Purânas which contain the narratives of Vishnu's wanderings, deeds and that they have not found their way into the modern literature of India. If therefore the thousand visible manifestations of Siva's presence on earth, under as many different names, are known to the present Hindus by tradition only, we shall not be surprised that they united them all in one common typification by means of the linga. There are however a few exceptions. A form of Siva which is especially worshipped by the lower orders, who consider him as the destroyer of children, is known under the name of *Panchânana*; it is a misshapen stone, anointed and painted, and then placed under trees. Another form which is still preserved is that of the *Kâlurâya*, the god of forests. He is represented as sitting on a tiger, and carrying a bow and arrows. The woodcutters worship him to insure protection from wild beasts. These numerous names of Siva have led Europeans into a notion contrary to that which induced the Hindus to make the linga the general type for all the forms of this god; they naturally enough supposed each of his numerous names and pagodas to belong to a distinct and separate deity. Hence the erroneous notion about polytheism in India, whilst it is evident, even from the few passages we have quoted, that the original monotheism of Hindu religion had in the progress of time become pantheism, which is prevalent all over the East. Even at present the follower of Siva denies the divinity of Vishnu, and *vice versâ*, although both these gods, now representing the Supreme Being, were only types of divine qualities attributed to the Trimûrti. But the allegory eventually acted too strongly on the imagination of the people. Brahma, as creator, had finished his work, and could not with propriety act any more. Siva therefore and Vishnu were destined to do all that fancy could suggest; but still Mahâdeva is the only god to the Saivas, whilst Nârâyana is the one chosen by the Vaishnavas. For this we have the express words of the Rudra Tantra, which says that the form of Ardhanâreswara (half man, half woman) was assumed by Siva in order to prove that he was the one Brahma, in whom both the female and male powers are united. (Rolle, i. 15; Bohlen, i. 150.) This notion of the animating and recipient principles being united in one, has been embodied in the statue termed Ardhanari; one half of Siva, from head to foot, bears all the ornaments of Pârvati or Bhavani; the other is exactly the same as that in which he is usually exhibited. The Vyaghra (tiger) of Kâli is also seen under the female half of this symbol, and the bull Nandi lies at the foot of the man portion of Siva.

Sects of Saivas.—The *Dandis* are separated into two classes. 1. The *Dandis* proper are the only legitimate representatives of the fourth asrama, or mendicant life, into which the Hindu is to enter after passing through the previous stages of student, householder, and hermit. (Manu, vi. 33.) They worship Siva as Bhairava; the ceremony of initiation consists in a small incision being made in the inner part of the knee, and in drawing the blood of the novice as an acceptable offering to the god. 2. The *Dasnâmi Dandis* admit only Brahmans into their fraternity, and are the primitive members of the Dandi order. Sankara, the teacher of the caste, has perpetuated his influence by writings, the best of which are his Bhâshyas, or Commentaries on the Sûtras (aphorisms) of Vyâsa, and on the Bhagavad-Gita. They are distinguished by carrying a small dand (or wand), whence they derive their name, and a piece of cloth dyed with red ochre. They shave their hair and beard; wear only a cloth round their loins; and subsist upon food obtained ready dressed from the houses of the Brahmanas. Their principal study is that of the Vedanta works. (*As. Res.*, xvii. 169.)

The other sects are the *Raudras, Ugras, Bhâktas, Jangamas, Pâsupatas*, and others, each of which wears the linga on some part of the dress or person, and are distinguished from each other accordingly. This sign is often worn in small cases of silver or brass. (Dubois, i. 147.) Their occupations are generally similar to those of the Dandis (for the principal points in which they differ, see VISHNU). Their scriptural authorities are the Siva-Gîta, Siva-sanhita, Siva-harasya, Rudra Samoha Tantra, and a great number of Tantras which are little known.

Among the sects of Siva there are women who are devoted to the service of their gods, under the name of spouses of the gods. They are called linga-vadhvas, and wear the stamp of the linga on their thigh. Although known to be the concubines of the priests, they enjoy considerable respect. (Dubois, i. 179.)

Among the chief places of pilgrimage sacred to Siva, is Kasi, or Benares, which contains the finest temple, known under the name of the Pagoda of Vis'wes'wara. Chandra Sekhara, a mountain near Chittaganga, on which stands a temple of Siva, is another place of pilgrimage. The surface of a pool of water at this place is said to emit inflammable air, from the fire of which pilgrims kindle their burnt offerings. According to a statement of Ward (ii. 130), Ekamrakanana, a place on the borders of Orissa, contains 6000 temples. Not less than 70,000 or 80,000 people are said to visit this place at the drawing of the car of Jagannâtha, when all castes eat together.

Of the festivals of Siva the chief is that called Sivarâtri. It lasts three days, which are employed in performing various rites before the linga, which they wash four times. The occasion of this is the Bhavishya-Purâna: 'A bird-catcher detained in a forest in a dark night climbed a Bilwa-tree, under which was an image of the linga; by shaking the boughs of the tree the leaves and drops of dew fell upon the image; with which Siva was so much pleased, that he declared the worship of the linga on that night should be received as an act of unbounded merit.' (Ward, ii. 20; Dubois, ii. 328 and 530.) This takes place on the 14th of the increase of the moon in February. For the other festivals common to both sects, see VISHNU. The Monday is generally consecrated to Nandi (Siva's bull), and no work is done.

The shape of the temples of Siva does not differ from those of the other gods. The chief entrance into the great temple is by a high massive pyramid, the top of which has generally the form of a crescent; it invariably faces the east. Beyond the gate there is a large court, at the farther extremity of which another gate leads through a pyramid of less height, but of the same form. A small yard separates it from the temple of the idol. In the middle of it there is either a huge bull or a linga carved in stone, raised on a pedestal, or put under a canopy supported by four pillars. This is the first object of adoration to the visitors, who then pass through a low narrow door into the inside of the temple. This door is the only passage for light and air, there being no windows. A lamp, which burns night and day, gives a tolerable light. The interior of the building is generally divided into two parts, sometimes into three, the first of which is the most spacious, and is destined to receive the people; the second, or the *adytum*, in which the idol resides, is much smaller and darker, and generally shut, the door being opened only by the officiating priest, who, with some of his attendants, has alone the right of entering this mysterious place for the purpose of washing the image, and dressing and bringing offerings to it. This part is often built in the shape of a vault, but it is so low as to make a prolonged stay in it rather oppressive.

Among the trees sacred to Siva the chief are the Vepu and the Bilwa, the leaves of which are often brought as offerings to the god. The first of these trees has to undergo the singular ceremony of being married to the Aswata (the holy fig-tree); the formalities are much the same as those which take place at the marriages of the Brâhmanas. Siva himself is said to be the stem of the Aswata-tree, of which Brahma is the root and Vishnu the branches. Besides the Vepu and the Bilwa, there are numberless inanimate objects sacred to Siva.

It has already been mentioned that the bull is the animal which enjoys the greatest veneration from the Saivas, and to which a day in the week is consecrated.

The worshippers of Siva are distinguished from the rest of the Hindus by burying their dead bodies, instead of burning them. The obsequies are performed in the following manner, if the deceased is a Saiva Sanhyâsi:—The corpse is deposited, with its legs crossed, in a large basket made of bamboo, which four Brâhmanas carry to the grave, which is dug in the neighbourhood of a river or pond. It is about six feet deep, and of a circular form. They cover the bottom of it with a thick layer of salt, upon which the deceased is placed in a sitting position; the space between him and the sides of the grave is then filled with salt up to the chin of the corpse, with the view of holding up the head so as not to allow of its being moved. A great number of cocoa-nuts are then thrown against it until the skull is quite broken, when they throw salt upon the place so as to hide entirely the fractured head. They then erect over the grave a kind of tumulus, an elevation about three feet high, on the top of which a linga of two feet, made of clay, is placed, and immediately consecrated by the *mantras* (incantations) of the Brâhmanas, who present to it kindled lamps, flowers, incense, bananas, and other offerings. This ceremony is performed with the accompaniment of sacred hymns, which are sung by those who are present at the burial. At the termination of this discordant concert, as it is termed by Dubois, he who presides at the ceremony goes three times round the linga, inclines himself before it, and expresses his hope 'that by virtue of the sacrifice offered to the linga, the deceased may be agreeable to Siva, and that being once received by Brahma (*paramâtma*, the universal soul) he may not be obliged to be born again.' During two days which follow this ceremony, offerings are brought to the linga every morning, and the sacred mantras are repeated. A year afterwards the ceremony is performed again, but with less expense to the family of the deceased.

It has been mentioned in the course of this article, that nothing indecent occurred at the festivals in honour of Siva, or in worshipping his type the sacred linga; but since so much has been said in support of an assertion tending to throw doubt upon the strict observance of all the rules of decency, and to identify the practices of the linga worshippers with the phallic ceremonies of the Greeks, it seems proper to state what may have occasioned this report.

There is indeed in India a sect, which some writers have stated to belong to the Saivas, whilst others describe them as votaries of Vishnu; others again, and apparently with more reason, speak of them as independent of either: they are called Sâktas, and adore the female organ of generation under the type of the *yoni* (pudendum muliebre, a figure of stone or wood in the shape of a heart). Their name Sâkta is derived from Sakti, which means power, aptitude, and is the name of Siva's consort.

These Sâktas seem to found their religious belief on a passage in one of the Upanishads to the Atharvan-Veda, quoted by Windischmann, p. 847: 'Voluptatem in amplexu foeminæ, et voluptatem emissionis et voluptatem acquirendi nati fausti, qui desiderium patris post mortem ejus adimpleat, et gaudium quod in illo tempore simul provenit, etiam Brahma esse qui scit oportet eum meditari de illa (*i.e.* cum illa yogam inire);' and certainly in some of their festivals they commit great excesses. Dubois, an eye-witness, states expressly that they are held in honour of Vishnu (i. 402). The ceremony of the Sakti-pûja is performed at night with more or less secrecy, a minute description of which is given by Dubois. We shall content ourselves with observing that the least odious of these orgies are those where they limit themselves to drinking and eating all that is forbidden them by their Sâstras, and where men and women violate the most sacred rules of decency. This is the only instance where the worship of the generating principle has been made the pretext for the most revolting orgies, where the idea degenerated in the same manner as it did in Rome and Greece. There too the principle was the same—a highly philosophical and moral idea. The doctrines of the Egyptians laid the foundation of the Eleusinian mysteries; Isis became Demeter, Orus the Bacchus Iacchus. That same Isis was the Sakti of the Hindus: the notion which this Sanscrit word conveys suits exactly the description of the Egyptian goddess by Plutarch. According to him Isis was the generative power (*δύναμις*), which lay dormant until Osiris's vivifying principle had reproduced himself by her in his son Horus. The same idea was in Plato's mind when he said that nature was composed of three things, and could be represented by a triangle. There are still some passages of Greek and Ro-many writers which prove that the worship of the phallus had in other places been as pure as that of the linga. Tacitus, for instance (*Hist.*, ii. 3), describes a linga in the temple of Paphian Venus without being aware of it; these are his words:—'Simulacrum deae non effigie humana; continuus orbis latiore initio tenuem in ambitum, metae modo, exsurgens; et ratio in obscuro;' and Rolle, ii. 349, says, without mentioning his authority, 'It was the custom of the Greeks to put phalli on the tombs, that the productivity of nature, extinct, or rather, stopped for a short time by death, might take a new life.' This coincides exactly with the ceremony observed by the Saivas at their funerals. It does not appear however what kind of images were used upon this occasion; but those which Pliny (xix. 4) mentions, and which he calls *satyrica signa*, must have differed from those which are described as belonging to the Greeks. Another circumstance which is remarkably like the practice of the Hindus which we have mentioned, is the custom of wearing phalli in small silver cases to protect children against *fascinations*, as stated by Varro (*Ling. Lat.*, vi. 5, p. 99, Bip.). Other traces of the linga as considered by the Hindus may be found in Socrates (*Hist. Eccl.*, v. 17), where he relates that at the destruction of a temple of Serapis in Alexandria a number of signs were found, the purpose of which was not understood; among them there was one in the shape of a cross, which the heathens stated to be the symbol of a future life. The Christians, he continues, by the means of this cross made a great number of proselytes. Now this cross is the same by which we mark the planet Venus (♀), and which, when first seen, was supposed to mean the key to the mysteries. Jablonsky was the first who understood its real import, when he expressed himself thus: 'Crux ansata sive phallus adeo similis est lingam illud Brahmanorum ut ovum ovo similius esse nequeat.'

For the description of the degraded phallic worship we must refer to the 2nd vol., pp. 257-274, of the 'Indian Antiquities' of T. Maurice, who traces the origin of the linga worship back to Egypt, and gives a faithful paraphrase of the account contained in Diodorus Siculus, by which he only proved how little he knew the Hindu view of the subject.

The rage for identifying the gods of the Eastern nations with those of the West has not spared Siva. He was Bacchus, and Saturn, and Pluto; in fact, he was said to be almost the entire pantheon of Greece and Rome and Egypt. Neither is this to be wondered at, seeing that the Greeks and Latins ascribed different attributes to different deities. The Hindus have only one to whom to ascribe all attributes. Siva is also, and it appears originally, the representative of fire. This element penetrates earth and water, represented by Brahma and Vishnu, imparts to them some of its vigour, develops their qualities, and brings everything in nature to that state of increase, maturity, and perfection which they would not attain without it. But ceasing to act beneficially on the created things, they perish: this agent of reproduction, when free and visible, consumes the body, the composition of which he himself had effected: to this quality he owes his title of god of destruction.

The reader who may wish to see the connection of the Hindu gods with those of Greece and Rome will find ample materials in the papers which Col. Wilford inserted in the earlier volumes of the 'Asiatic Researches:' they cannot however be implicitly relied on.

SIVAS, or **SIWAS**, a town in Asia Minor, on the north bank of the river Kizil-Irmak, in 39° 45' N. lat. and 36° 52' E. long., 165 geographical miles south-west by west from Trebizond, and 87 northeast from Kaisariyeh. It is the capital of a pashalic which comprehends the whole eastern part of Asia Minor, and which still bears the name of Rûm, or Rûmiyeh, which was applied to the whole Turkish empire before its expansion. The valley of the Kizil-Irmak, the antient Halys, here spreads out into a broad and fertile plain. The situation being level, with the exception of only one small circular elevation in the south-west, the whole city is seen to great advantage when approached from the north. It is interspersed with trees, without being buried in them, like some of the towns in these parts. The great number of chimneys seen above the house-tops indicate that the winter is severe; and the inhabitants affirm that it is as cold as at Erzrúm. The houses are well built, partly tiled, partly flat-roofed, and intermingled with gardens. These, with the numerous minarets, give a cheerful aspect to the place. The bazaars are extensive and well stocked with goods, including many of British manufacture. The consumption of Sivas itself, and the circumstance of its furnishing supplies to many places, causes its transit-trade to be extensive. Sivas is inhabited by about 5000 families, of whom 1000 or 1100 are Armenians, and the rest Moslems. The place was once called Cabira, a name that was changed to Diopolis by Pompey, and subsequently to Sebaste. Sivas is a corruption of the word Sebaste. It was the theatre of the great contest, in 1401 A.D., between Bajazet and Timour, in which the former was defeated. An Armenian historian states that the town then contained 120,000 souls; and that it capitulated to Timour, on condition that their lives should be spared, which condition he most barbarously violated.

(Mr. Johnston's *Journal*, in the *American Missionary Herald*, Oct. 1837; and Mr. Consul Suter's *Journal*, in *London Geographical Journal*, 1841.)

SIWAH is the modern name of the oasis in the Sahara, which was called by the Greeks and Romans Ammonium, Ammonis, or Ammoniaca, from the celebrated oracle and temple of Jupiter Ammon, with whose worship the Greeks became acquainted through the Cyrenæans. The town of Siwah is in 29° 12' N. lat. and 26° 17' E. long., and is about 160 English miles from the sea-coast, and twelve days' journey from Cairo. The distances between the temple of Ammon and several of the Egyptian towns are stated by the antients thus: from Memphis it was twelve days' journey (Plin., *Hist. Nat.*, v. 5); from the village of Apis, five days' (Strabo, xvii., p. 799); and from Thebes, ten days' journey (Herod., iv. 181). The whole oasis is about fifteen geographical miles in length and twelve in breadth; but Diodorus (xvii. 50) says that the length and breadth are about 50 stadia, which would only make a little more than five geographical miles. Nearly the whole of the oasis has a fruitful soil, and is watered by many springs of fresh as well as of salt water, the latter of which probably arise from the masses of salt mentioned by Herodotus. The aspect of the oasis is that of an undulating country, and in the north it is surrounded by high limestone hills. The antients speak of three things as remarkable in this oasis: first, a well, called the Well of the Sun, of which the water was warm in the morning and evening, and cold at mid-day (Herod., iv. 181; Diodor., xvii. 50; Lucr., vi. 849, &c.; Pomp. Mela, i. 8); secondly, a large palace of the antient kings of the Ammonians, which was surrounded by a triple wall, and situated in the centre of the oasis (Diodor., xvii. 50); and thirdly, the temple of Jupiter Ammon, which was surrounded by a shady grove. Cambyses made an unsuccessful attempt to take the Ammonium (Herod., iii., 25); and it was visited by Alexander the Great. [Alexander.] In the reign of the Ptolemies and under the Romans the oasis belonged to that nomos or province which was called Libya (Ptolem., iv. 5). In the time of Strabo (xvii., p. 813) the oracle was almost entirely neglected. In the middle ages the Arabs called this oasis Santariah.

The Ammonium, during its most flourishing state in antient times, seems to have been well peopled; and the inhabitants are said to have consisted of three distinct tribes. The southern and western parts were inhabited by Æthiopians, the middle part by the Nasamones, and the north by a nomadic tribe of Libyans. No town however is mentioned in the oasis, but it is stated that its inhabitants lived in villages (Diodor., xvii. 50). The description which Diodorus gives of the beautiful climate of the oasis, and of its fertility, especially in fruit, is still applicable to it: nearly the whole oasis forms one uninterrupted succession of meadows, fields, and palm-groves; and the gardens produce an abundance of the most delicious fruits. The water however is said to be injurious to camels.

The present inhabitants consist chiefly of Berbers mixed with negroes, and all are very zealous Mohammedans. Since the year 1820 they have been subject to the viceroy of Egypt, to whom they pay an annual tribute of 2000 camel-loads of dates and 10,000 Spanish piasters. Their jealousy of foreigners has frustrated several attempts of Europeans to investigate the interior of the oasis. The principal place in it bears the name of Siwah, and has about 8000 inhabitants. This, as well as the several other smaller places in the oasis, are built upon eminences, and surrounded by walls to protect them from hostile inroads. The houses are all wretched huts, and the streets narrow and dark.

Ruins of the antient temple of Ammon, as well as of a wall by which it appears to have been surrounded, are still visible. The paintings, sculptures, and hieroglyphics which are still preserved on the walls, are copied and described in the work of Minutoli. There are also ruins of other places, especially in the neighbourhood of the modern village of Shargiah, which probably mark the sites of the antient villages. The Well of the Sun is also near Shargiah, and is still remarkable for its varying temperature. Catacombs cut in the rocks have been discovered in four different parts of the oasis.

In the year 1820 Baron Minutoli undertook a journey to Upper Egypt and the oasis of Siwah; and some years after, his account of it was edited by Tölken, under the title 'Reise zu dem Tempel des Jupiter Ammon und nach Oberägypten,' Berlin, 1824, 4to. This work contains a map of the oasis. In 1827 Tölken published a supplement to this work, in which he endeavours to explain the archæological and mythological points which are mentioned in the work of Minutoli.

SIX CLERKS. The office of Six Clerks is an office of great antiquity connected with the Court of Chancery, proprobably as antient as the Court itself. The number of the Six Clerks was limited to six as long ago as the 12th Rich. II. The history of this office illustrates the mischief of attempting to regulate the supply of legal services to the client. It exhibits an instance of the principles of interference and monopoly destroying two successive classes of officers, in spite of the strongest support which the law and the courts could give to them.

The Six Clerks were originally the only attorneys of the Court. By the common law any person who was impleaded in any of the courts of law was bound to appear in person, unless he obtained the king's warrant, or a writ from Chancery enabling him to appear by attorney, 'by reason whereof,' says Lord Coke (1 *Inst.*, 128), 'there were but few suits.' There are many early statutes still in force enacted for the purpose of empowering the subject to appoint an attorney. The earliest statute is that of Merton (A.D. 1235), whereby it is 'provided and granted that every freeman which oweth suit to the county, tithing, hundred, and wapentake, or to the court of his lord, may freely make his attorney to do those suits for him.' Subsequent Acts extended this privilege to other parties and other courts; but to this day it would appear that by the strict law of the land, except so far as it has fallen into desuetude, persons in good health, in pleas relating to money, are bound to appear in person. None of these statutes however extended to Courts of Equity, but, as far as appears, every person who was desirous of relief, or compelled to defend himself in the Court of Chancery, was obliged to employ one of the Six Clerks as his representative.

In early times great exertions were made to limit the number of attorneys who were allowed to practise in each court. The increase of litigation which accompanied the increase of property was looked on as an evil to be checked in every possible method; and the method most relied on was that of limiting the number of legal practitioners. The well-known statute of 1455 (33 Hen. VI., c. 7., which is still in force) may be referred to as an instance. It recites a practice of contentious attorneys to stir up suits for their private profits, and enacts that there shall be but six common attorneys in Norfolk, six in Suffolk, and two in Norwich, to be elected and admitted by the chief-justice. In 1564 a rule was made by the Court of Common Pleas, that every attorney of that court 'should satisfie himself with the suits in the same, and forbear to be towards any causes as plaintiff in any other the Queen's Majestie's courts here at Westminster.' As late as the year 1616 a rule was made, 'that the number of attorneys of each court be viewed, to have them drawn to a competent number in each court, and the superfluous number to be removed.' These various regulations, so far as they were enforced, could only have been detrimental to the public; and as regards the Courts of King's Bench and Common Pleas, they seem not to have been long insisted on. As to the Exchequer, the principle of monopoly was continued in force down to the year 1830, until which time eighteen attorneys only were admitted to practise in it. As a consequence, that court was, before the year 1830, scarcely at all resorted to. Since that time more actions are commenced in it than in any other court. In the year 1632 a new principle was introduced into the Common-Law Courts, and all persons wishing to be attorneys were required to serve an attorney under articles for six years (since reduced to five). The Six Clerks' Office however did not adopt this method until long after. They got over the difficulty by admitting under-clerks, afterwards called sworn clerks, to practise in their names, and they shared in some way or other the profits with them. In 1548 an inquisition was appointed, to inquire into the supposed exactions and abuses of the Court of Chancery, and the fees then payable for the business of this office. A copy of their presentment was printed by order of the House of Commons, 8th February, 1831. It shows that all the fees payable for business done in this office were at that time payable to the Six Clerks; and it contains no allusion whatever to the under-clerks as being in any way known as officers of the court. They seem at that time to have held a position with regard to the Six Clerks, quite analogous to that the solicitors for a long period were under with regard to the sworn clerks, and to have been the real persons who prosecuted the causes. They must have been numerous, as in 1596 an order was made limiting the number that each Six-Clerk should be allowed to have under him. Soon after this the Six Clerks, instead of taking clients according to the clients' choice, agreed to divide the business coming from time to time into court among themselves alphabetically. This arrangement shows that the scheme of a limited number of legalised attorneys for the Court of Chancery had now entirely ceased to operate, and had been converted into a mere legal pretext to enable these officers to tax all who were driven to such Chancery Court for justice. This regulation for dividing the business was, after some years, set aside on petition of the master of the rolls to the crown, as a monopoly and a breach of the liberty of the subject. In 1630 the office of Six-Clerk was, if not a sinecure, at least an appointment of great value. From a ridiculous story told about Sir Julius Cæsar, the master of the rolls, in Clarendon's 'Rebellion' (vol. i., p. 52), it appears that the appointment at that time sold for so large a sum as 6000*l*. About this time the under or sworn clerks, or clerks in court (for all these names apply to them), began to be frequently mentioned in the orders regulating the court, and soon grew into a very important body. The under-clerks were the parties who knew the merits of the different causes, and were interested in getting the work done, so as to gain the fees from the clients. The Six Clerks had begun to sink into the lethargy of sinecurists. Many orders were made to spur them into activity, but all in vain. The following may be instanced—the 10th of Lord Coventry's orders (1635): 'The Six Clerks, who are the only attorneys of this court, ought to inform themselves continually of the state and proceeding of their clients' causes, whereby they may be able to defend their clients, and to give account to the court, as the attorneys in all other courts do, and not leave the care and knowledge thereof upon their under-clerks, who attend not in court; and the clients, and such as follow their cause, are to acquaint their attorneys for that purpose.' Order of 1650: 'Whereas only Mr. Hales, one of the Six Clerks of this court, gave his attendance this morning at the sitting of the court, at the entering into the hearing of the cause wherein Kitchin is plaintiff against Meredith defendant, and the rest of the Six Clerks made default: it is therefore this present day ordered, that such of the six clerks who so made default of their attendance and service to this court, at the beginning of that cause, be fined ten shillings a-piece to the poor, and the usher of the court is to receive the same to the use aforesaid.'

The Six Clerks, in a paper given in by them to the Chancery Commissioners of 1825 (*Rept.*, Appx. B, No. 20), after communicating their present duties, state that 'From the first establishment of the Six Clerks, up to the Rebellion in the reign of King Charles I., many other important duties were attached to their office. During the usurpation however a part of the duties was assigned to certain new officers entitled the sworn clerks, who have ever since continued the execution thereof.' The Six Clerks in this statement have fixed rather too early a date to the legal transfer. Great efforts were made for reform of legal procedure during the Commonwealth. Among others there was an ordinance for abolishing the office of Six-Clerk in 1654, but it terminated, with the other ordinances of the Commonwealth, at the Recreation, and the judges endeavoured vigorously to maintain the Six Clerks in their old position. By an order of Lord Clarendon, of 1662, made 'On taking into consideration the manifold disorders and undue practices which of late times have crept into the Six Clerks' Office, to the great dishonour of this court, the obstruction of justice, and the damage of the client,' the alphabetical division was re-enacted. 'And because it is very manifest that these misdemeanours and enormities are gotten into the office of the Six Clerks by the liberty and licence which the inferior clerks have of late assumed to themselves,' the numbers were to be limited to twelve under-clerks to each Six Clerk. It is obvious however that the decrepitude of a rotten constitution rendered these efforts nugatory. In orders about this time the under-clerks are sometimes referred to incidentally as the 'attorneys of the parties,' though it is strongly re-asserted that "the Six Clerks are the only attorneys of this court." In 1669 the Six Clerks submitted to their fate; an order was made fully recognising the under-clerks, and dividing the office-fees between them and the Six Clerks. The Six Clerks having secured their own monopoly, had, by the year 1668, become the aggressors, and had attempted to increase their income by admitting other persons, as well as the sworn or under clerks, to practise in their names. This was a cause of contention for many years. Before 1693 the under-clerks had obtained the privilege of filling up all the vacancies in the office by taking articled clerks themselves. From this time the office of Six-Clerk has become a complete sinecure, and the Six Clerks are only mentioned in the court's annals with respect to the fees that they are entitled to demand from suitors, as door-keepers, as it were, to the court. Their business, such as it is, for a long time has been managed by one or two private clerks, employed as clerks to the whole body of Six Clerks; and the Six Clerks have signed the necessary documents for each other, each being at the office for two months only in the year. The office is virtually abolished by Lord Brougham's Act, 3 & 4 Wm. IV., c. 94, s. 25, which enacts that vacancies shall not be filled up till the number of Six Clerks is reduced to two. Nearly the same story has to be told over again with reference to the sworn clerks. For a long time these under-clerks were the principal solicitors of the court; and until the middle of the last century the chief business of the court was transacted by them without the intervention of a solicitor. The same principle of monopoly has with them led to nearly the results that it did with their titular superiors. A vested right to fees in the various stages of equity proceedings brought about an inattention to business, which has led to the transfer of the prosecution of suits to the solicitors.

In 1670 a new half-official character was given to the articled clerks of the under-clerks. They were legalised under the name of 'waiting clerks.' This new body soon began, as the following extract from an order of the master of the rolls of 1684 will show, to imitate towards their own masters the insolence which the sworn clerks had thirty years before shown to their superiors the Six Clerks:—'Whereas complaint hath been made by the petition of the sworn clerks of this court to the right hon. the master of the rolls, that divers of their under-clerks have of late behaved themselves after a bold, insolent, rude, and disorderly manner in the Six Clerks' Office, as well towards their respective masters as to others the sworn clerks, and to the suitors of the court attending the despatch of their business there, by unmannerly and abusive language, breaking of windows, cutting desks, breaking down seats, throwing stones and other things at the said sworn clerks and their clients, whereby, and by making rude and indecent noises, they often forced them to leave the said office, and caused the same to be shut up in the most usual time of business, and when the court hath been sitting, to the great scandal thereof, and damage of the said sworn clerks and their clients, and contrary to the duty of the said under-clerks, and the antient and laudable usage of the said office: and whereas complaint hath been likewise made to His Honour by petition of the under-clerks that the Six Clerks do take and employ persons to be their writing-clerks who have not been articled clerks, or ever educated and employed in the said office; and that several of the sworn clerks have and do not only take more than one articled clerk, which they, by the rules and orders of the said court for the government of the said office, ought not to do, but do likewise carry the records out of the said office, and cause the same to be copied at under-rates by persons out of the office, rather than to allow to their under-clerks their due fees for copying thereof.' It was accordingly, amongst other things, ordered 'that no under-clerk in the said office shall from henceforth during the time of his clerkship presume to wear any sword, either in or out of the said office, within the cities of London or Westminster, or the liberties thereof; or to be covered, or wear his hat in the said office, in the presence of any one of the sworn clerks; but that all the said under-clerks shall, during all the time of their respective clerkships, as well in their masters' seats as elsewhere in the said office, be uncovered, and behave themselves orderly, soberly, and with respect towards all the said sworn clerks and suitors of the said court; and in case any of the said under-clerks shall be idle in the said office, out of their masters' seats, they shall, upon the admonition or command of any of the said sworn clerks, immediately repair to their masters' seats, and quietly sit and attend their business there, from seven of the clock in the morning in summer, and eight in the winter, till twelve of the clock at noon, and from two of the clock in the afternoon until such time at night as their respective masters shall think fit.'

There is still another class of workers of a semi-semi-official character, even now not recognised by the court—the sworn clerks' agents. These gentlemen really now perform almost all the remaining duties of the office which the intrusion of the office of solicitor has left to it, except taxing the costs; and are paid (it would appear illegally) by some share of the fees received. The necessity for these agents seems to prove that a monopoly officer cannot work. After so many successive attempts by the court to have each successive class of officers do their duty in person, it is at last in the main done by gentlemen who are mere private persons, hold no official situation, and are liable in point of law to be turned away at any moment.

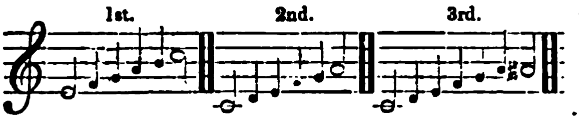
An effort was made on the occasion of the Chancery Commission of 1825 by several eminent solicitors to get the offices of Six-Clerk and clerk in court abolished. It was broadly stated in evidence by a solicitor of celebrity that Mr. S. (a gentleman whose mind had failed him) was 'quite as good a clerk in court after he was a lunatic;' and the expense of the office to the suitor was insisted on. The commission, influenced (as one of their number has lately declared) by Lord Eldon, stated they saw no reason to interfere with these offices; and they have remained to the present day. It is now however condemned by the unanimous voice of the whole profession, and its fall may be shortly expected. At present the client has still to use the Six-Clerk's name as his attorney. He therefore pays his own solicitor for his services; he pays a clerk in court (and his partner, the real working agent) for letting the solicitor get, in his name, to the Six-Clerk for liberty to use the Six-Clerk's name, and he pays the Six-Clerk for this liberty also. Therefore what was once fair emolument has now become plunder. It is mainly to the existence of such legal abuses as have here been pointed out, that we must look to account for the astonishing fact that more suitors annually applied to the Court of Chancery for aid 100 years ago than do now. So little does personal talent affect the office of clerk in court, that an executor of a clerk in court can sell the practice of his testator to another clerk in court, almost with a certainty that not a client will be lost, however mean may be the talents of the purchaser.

The emoluments of the office have long been a subject of speculation among the profession of the law. They were represented by Lord Eldon's commission as causing 'a very trifling expense to the suitors.' The accuracy of this representation was suspected, and orders were made on various occasions by the House of Commons for the Six Clerks and clerks in court to return the amount of their receipts, but the return could never be procured, until, in the year 1840, a solicitor, by a variety of calculations, demonstrated that the amount must be between 58,000*l.* and 63,000*l.* a year. The return at last has been obtained, and it turns out to have been, for the year 1839, 59,967*l.* 6*s.* 9*d.*, with some extra fees received by the Six Clerks not included in the return. (See *Return*, printed by order of the House of Commons, 1840.) The Six Clerks receive only a small amount of the whole sum, about 1300*l.* a year each. One of the clerks in court alone appears to be in the gross annual receipt of above 10,000*l.*

For further information as to this office, the reader is referred to the case 'Ex-parte the Six Clerks,' 3 Vesey's 'Reports,' 519; to the 'Reports of the Commissioners on the Offices of Courts of Justice' of 1816; to the 'Report of 1825 of the Chancery Commission;' to Beames's 'Orders of the Court of Chancery;' and to several recent pamphlets by Mr. Spence, Mr. Field, Mr. Merivale, and Mr. Wainewright; and to a powerful speech on Equity Reform, made in the end of the session of 1840, by Mr. Pemberton, since published in a separate form.

SIXTH, a musical interval, a concord, the ratio of which is 5 : 3. [CONCORD; HARMONY.]

Of the Sixth there are three kinds; the *Minor Sixth*, the *Major Sixth*, and the *Extreme Sharp Sixth*. The first (E, C) is composed of three tones and two semitones; the second (C, A), of four tones and one semitone; the third (C, A♯), of four tones and two semitones. Ex.:—



SIXTUS I. is recorded as bishop of Rome after Alexander I., about the beginning of the second century of our æra, but the precise epoch is not ascertained, and nothing more is known of him.

SIXTUS II. succeeded Stephen I., A.D. 257. He is said to have been by birth an Athenian, and a philosopher of the Academy until he became a convert to Christianity. He suffered martyrdom in the persecution of the Christians under the emperor Valerianus, A.D. 258.

SIXTUS III. succeeded Celestine I., A.D. 431. He endeavoured, though with little success, to settle the dispute between Cyril, bishop of Alexandria, and John, bishop of Antioch, concerning the Nestorians. Several of his letters are contained in Constant's collection. He died in 440.

SIXTUS IV. (Cardinal Francesco della Rovere), a Franciscan monk, succeeded Paul II. in 1471. He greatly enriched his nephews, or sons, according to some, one of whom was afterwards pope under the name of Julius II. He seized Città di Castello from its lord, Niccolò Vitelli, and took Forli, Imola, and other places. He afterwards supported the conspiracy of the Pazzi against Lorenzo de' Medici, and his nephew Cardinal Riario was present in the church when Giuliano, Lorenzo's brother, was assassinated. The conspiracy however failed of its principal object, for Lorenzo was saved, and the conspirators were put to death, including Salviati, archbishop of Pisa, who was one of the leaders. Riario was saved by Lorenzo's interposition, and merely confined for a time. Sixtus, on hearing the news, excommunicated Lorenzo, and all the magistrates of Florence and their abettors, for having hung the archbishop. The clergy of Florence took the part of Lorenzo, and being assembled in convocation or synod held for the occasion, they signed an act of accusation grounded upon depositions and statements of facts proving Sixtus to have been accessory to the conspiracy and the murder of Giuliano. This curious document, the original of which, in the hand-writing of Gentile d'Urbino, bishop of Arezzo, exists in the archives of Florence, is given by Fabroni and Roscoe in their respective biographies of Lorenzo. The expressions used by the clergy of Florence, in speaking of the head of the church, are stronger than any of those used half a century later by Luther and the other reformers. Another document, drawn up by Bartolomeo Scala, chancellor of the republic of Florence, corroborates the statements in the Florentine synod, by giving an historical memorial of all the proceedings of that celebrated conspiracy. Pope Sixtus induced Ferdinand, king of Naples, to join his troops to the papal forces against Florence, but the Florentines braved the storm, until Lorenzo took the bold resolution of proceeding to Naples alone, to plead the cause of his country before King Ferdinand, in which he succeeded. Sixtus, being forsaken by his ally, and alarmed at the same time at the progress of the Turks, who had landed at Otranto, was fain to agree to a reconciliation with the Florentines. In 1482 Sixtus entered into another intrigue with the Venetians, for the purpose of depriving Duke Ercole d'Este of his dominion of Ferrara, which he wished to bestow upon Count Girolamo Riario, another of his nephews. This led to a war, in which the king of Naples and the Florentines supported the duke of Ferrara against the pope and the Venetians. The emperor however interposed, threatening to call together a general council of the church, upon which Sixtus thought it advisable to detach himself from the Venetians, and make a separate peace with the duke of Ferrara. He then advised the Venetians to do the same, and as they disregarded his counsel, he solemnly excommunicated his late allies. In 1484 however the Venetians made peace also, and a few days after Sixtus died. He was one of the most turbulent and unscrupulous in the long list of pontiffs.

SIXTUS V. (Cardinal Felice Peretti of Montalto) succeeded Gregory XIII. in 1585. His first care was to purge the city and neighbourhood of Rome of the numerous outlaws which the supineness of his predecessors had encouraged. He resorted to summary means, he employed spies and armed men, and he soon extirpated by the sword and the halter the noxious brood. The name of 'Papa Sisto,' as connected with his summary justice, has continued proverbial at Rome to the present day. Being a shrewd politician, he disliked the overgrown power of Spain, and was not displeased at the staunch opposition which Philip II. received from Elizabeth of England, whom Sixtus however formally excommunicated as a heretic. He embellished Rome with numerous and useful structures, among others the present building of the Vatican library. (Bocca, *De Sixti V. Edificiis*, in his *Bibliotheca Vatican*.) He published a new edition of the Septuagint, 1587, and one of the Vulgate with improvements, 1590; and he himself edited the works of St. Ambrose, and is said also to have superintended an Italian translation of the Bible, which was condemned by the Spanish Inquisition, between which body and Sixtus there was little sympathy. Sixtus died in August, 1589. His life has been written by Leti, Tempesti, Robardi, and others. As a temporal prince he was distinguished in his age.

SIZAR, a term used in the University of Cambridge for a class of students who are admitted on easier terms as to pecuniary matters than others. These pecuniary advantages arise from different sources in different Colleges, and are of different value. Originally certain duties were required of the students so admitted, approaching to the character of menial, but these have been long discontinued. A similar class of students at Oxford are called Servitors. The word is supposed to be derived from *size*, which is used in the University to denote an allowance of provisions at the college buttery; and that from the verb to *assize*, which is much the same as the modern *assess*, which means *apportion*.

SKATE. This name, as well as the term Ray, is used in England to designate numerous fishes with cartilaginous skeletons, having the body much depressed and more or less approaching to a rhomboidal form. The eyes and temporal orifices are on the upper surface, and the mouth, nostrils, branchial and anal apertures are situated on the under surface of the body; the tail is long and slender, generally furnished with two (analogues of the dorsal fins) and sometimes three fins, and usually armed with spines. The peculiar form of the skate arises chiefly from the great size and expansion of the pectoral fins; these extend from the head to the base of the tail, and are dilated in or near the middle in such a manner as to give (combined with the pointed snout) that rhomboidal form so peculiar to these fishes. The jaws are as it were paved with teeth, and these approach more or less to a rhomboidal form, and are flat, but in the adult males (at least of many of the species) those nearest the centre assume a pointed form.

The young of the skate, says Mr. Yarrell, are produced towards the latter part of the spring or during summer. They are deposited by the parent fish in their horny cases, like those of some of the sharks; but they are more square in form. These horny cases of the young skates are by some called purses, and on the coast of Cumberland have the name of skate-barrows, from the resemblance they bear to a four-handed machine by which two men carry goods. As the young skate increases in size, the angular parts of the body are curved over.

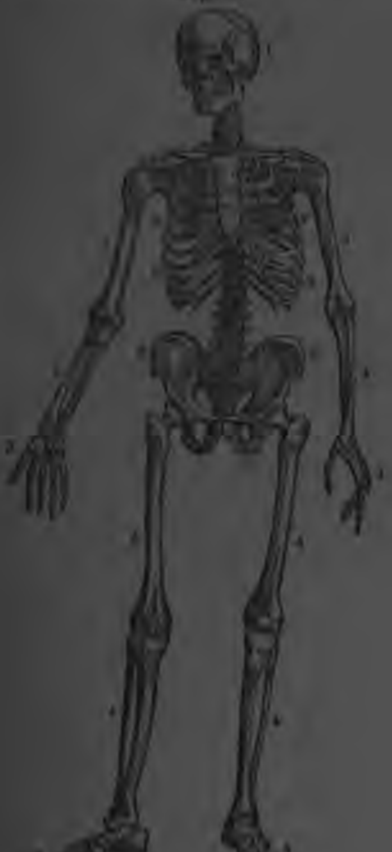
Nine species of skates, or rays, are found on the British coast, the distinguishing characters of which are carefully pointed out in Mr. Yarrell's *History of British Fishes*.

SKEEN. [CHRISTIANIA.]

SKELETON (from σκέλλω, 'I dry'), is the name applied to those harder parts of organized bodies which form the framework upon which the softer tissues are fixed. It is more particularly applied to the collection of bones which in animals either serve as fixed points for the attachment of the soft parts, or form cavities for enclosing and protecting important organs, or constitute the apparatus of support and the passive instruments of voluntary motion.

The present article will treat of the skeleton of man, as a standard with which to compare those of other animals described in the several articles on natural history and comparative anatomy. On this comparison of skeletons many of the most important facts of the latter science depends; for the bones, being the least destructible of the tissues, are the most convenient organs to examine in the different classes of the higher animals; and in accordance with the rule of the exact adaptation of all the parts of an organized body to each other, the skeleton of each animal affords general indications of the characters of every other organ in its body. And not only so; but each bone, according to the same rule, affords indications of the characters of the rest of the skeleton, and therefore, though less certainly, of the other organs of the body. Hence it is that, by an examination of a part of the skeleton of an extinct animal, geologists are enabled to form very probable suppositions of the form of the whole; knowing by certain marks on the bones, that they served for the attachment of muscles of corresponding form and strength, and that these muscles were adapted for peculiar movements, which again were most probably employed for certain purposes closely connected with the mode of life and the whole corporal organization of the animal.

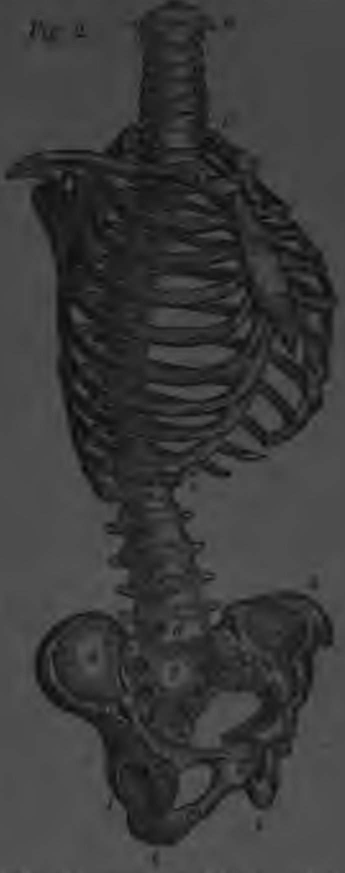
Fig. 1.



The human skeleton is divided into three principal parts: the trunk (2), the head (1), and the extremities (3 and 4). Neither the whole number of bones composing it, nor that in each main division, can be exactly stated, for many which are in early life separated, are subsequently united; but as an approximation, the following enumeration may be adopted:—Cranium, 8; face, 14; internal ears, 6; vertebral column, 24; chest, 25; pelvis, 4; upper extremities, 64; lower extremities, 62: in the whole, 223.

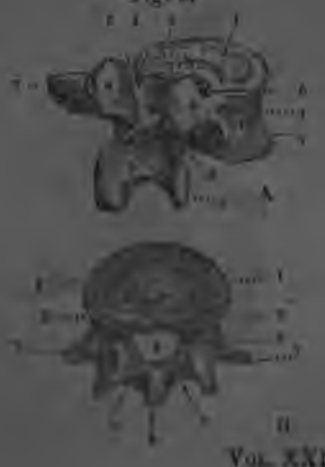
The trunk is composed of the spine or vertebral column (extending from a to d in the annexed *Fig.* 2), the chest, including the ribs and sternum or breast-bone (c), and the pelvis, the circle of bones on which the spine rests. The spine is the column of bones which, in the erect position, supports the head on its summit (a), and rests with its base (d) upon the sacrum. It consists of 24 bones called vertebræ (from *verto*, I turn), because it is their motion upon each other which enables the trunk to be turned round. Of the 24, the 7 upper (*a* to *b*) are called *cervical*, the 12 middle (*b* to *c*) dorsal, and the 5 lowest (*c* to *d*) lumbar, vertebræ. With the exception of the two first, they are all connected by interposed discs of a very elastic substance *c c*, the intervertebral cartilages.

Fig. 2.



The general characters of the vertebræ may be best studied on one from the lumbar region; in which the following parts, common to nearly all of the 24, are well marked:—a body, a ring, a spinous process, two transverse processes, four articulating processes, and four notches. In the annexed plate two lumbar vertebræ are represented: that in the figure A, as seen obliquely from behind, from above, and from the right side; and that in the figure B, as seen from above and behind.

Fig. 3.



The body (1) is a disk of bone with a nearly oval outline, larger above and below than at its middle, and having its greatest dimension from side to side. Its texture is spongy, invested with a thin layer of compact tissue. Its upper and lower surfaces, by which it is affixed to the two adjacent intervertebral cartilages, are nearly flat, and slightly marked by radiating lines. At its posterior border the oval outline is interrupted by a slight concavity (2), which forms a portion of the ring surrounding the spinal marrow, and in which there are several apertures larger than those on the rest of the body, for the exit of the veins from the interior

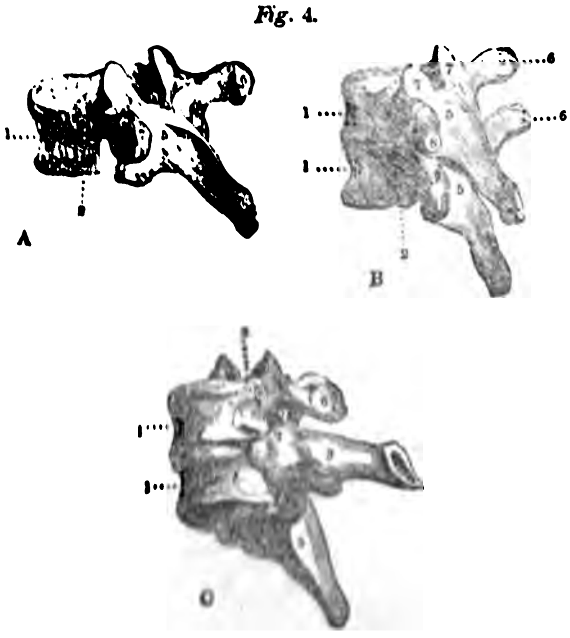
To either side of the posterior part of the body, and near its upper border, is affixed one of the extremities of the arch (3) by which the ring is completed behind. It is composed of two flat laminæ, which spring from the sides of the body, and meet at an obtuse rounded angle in the middle line behind, where they bear the spinous process (5). The space (4) included between the body and these laminæ is called the vertebral foramen; it is occupied by the spinal chord; it is of a somewhat triangular form, and in the lumbar vertebræ is of large size.

Close to the attachments of the laminæ to the body there is in each of their borders a rounded notch (6); and when the vertebræ are applied one on another, these notches form oval holes (the intervertebral foramina, see next figure (8), through which the spinal nerves pass, one pair going out between each two vertebræ. [NERVE.] To the rest of the laminæ are attached the interlaminar ligaments, or ligamenta subflava, bands of very elastic tissue by which the spaces between the adjacent arches are filled up, and the spinal canal completed behind, as it is by the intervertebral cartilages before.

The spinous process (5) is a broad flat quadrilateral portion of bone directed horizontally backwards from the meeting of the laminæ. Its posterior border is thickened, and to it, as well as to the upper and lower borders, are attached strong ligaments binding the spinous process of each vertebra to those next above and below it. The transverse processes (7) project horizontally outwards on either side; they are thin and long, and are enlarged and rough at their ends, to which several strong muscles and ligaments are attached. The articulating processes are flat and oval; each has a smooth surface, by which it is connected with the corresponding part of the next vertebra above or below. The upper pair (8) are set most widely apart, and their articulating surfaces are concave and turned inwards; the lower pair (9) are nearer together, and have their articulating surfaces turned outwards. When the lumbar vertebræ are put together, the lower processes of each are locked within the upper processes of the one next below, so that scarcely any lateral or rotatory motion is in this part of the spine possible.

The dorsal vertebræ, which in the adjacent plate are drawn, as seen in A and B, from behind and from the left side, and in C from before and from the same side, have the same general characters as the lumbar, but are distinguished from them by the following:—

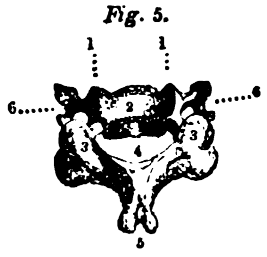
Fig. 4.



The body (1) is small but deep, and longer from before backwards than in any other direction; its general outline is heart-shaped; it has at each border, just in front of the attachment of the laminæ, a shallow depression (2); and when the vertebræ are set together, the depressions on either side of each adjacent pair form one cavity, into which the head of one of the ribs (C 3) is received for articulation. The laminæ are broad and thick; the vertebral foramen is oval and small. The spinous process (5) is long and narrow, and projects obliquely downwards; those of adjacent vertebræ are imbricated at their bases (*Fig.* B). The transverse processes (6) are long and directed backwards as well as outwards; each of them (except those of the two last vertebræ) has a smooth surface in front of its outer extremity, by which it articulates with the tubercle of the corresponding rib. The articulating processes (7), both superior and inferior, are equally wide apart; the former have their smooth surfaces turned backwards, the latter theirs forwards. The notches and foramina are smaller than in the lumbar vertebræ.

The cervical vertebræ, of which one is represented in the adjacent cut, as seen from behind and above, are distinguished by the body (2) being small, broad, and shallow and wider above than below. In its upper surface also it has two elevations (1) between which the lower part of the vertebra next above is received. The laminæ (3) of the arch are long and narrow, and enclose a large somewhat triangular vertebral foramen (4). The spinous process is short and bifurcated. The transverse processes (6) are short, horizontal, and bifurcated; and each has a foramen at its base, through which the vertebral artery passes. The superior articular processes have their smooth oval surfaces directed backwards and upwards, and they receive between them the inferior processes of the vertebra next above, whose articular surfaces are turned in the opposite direction.

Fig. 5.



But these distinctive characters of the several sets of vertebræ are only general: they are merged at the extremes of each set, the lowest dorsal being very like the upper lumbar, and the upper dorsal like the lowest cervical. Some single vertebræ, moreover, have particular characters. The first of the cervical set, or Atlas, is scarcely more than a flat ring of bone with two long transverse processes, two superior articulating processes, with large oval concave surfaces opposed to those of the occipital bone, and two inferior, with large flat horizontal surfaces, which articulate with those of the second vertebra. By the former joint the chief movements of depression and elevation of the head upon the neck are permitted; by the latter, those of rotation. The second cervical vertebra (named axis, or V. dentata) has a large pointed process, which rises from the upper part of its body, and is enclosed in a ring formed by the anterior half of the Atlas, and a transverse ligament passing from one side to the other of its body. In this ring the process of the axis rotates freely; or rather, the Atlas, with the head supported on it, moves round that process, and upon the flat superior articulating surfaces of the axis. The seventh cervical vertebra has a remarkably long spinous process, to which is attached the ligamentum nuchæ, a strong elastic band for the support of the head when inclined forwards, but which, as well as the spinous processes of all the adjacent vertebræ, is much more developed in animals that move horizontally and graze, than in man. This vertebra is also marked by having a small rib-like process in front of its transverse process; it is a rudimental rib, and is analogous to the cervical ribs of serpents and many other animals in whom the chest is more elongated than in man. The first and the three last dorsal vertebræ have each, at the upper borders of the body, surfaces for articulation with the whole head of the corresponding rib. The fifth lumbar has its lower surface cut obliquely upwards to articulate with the top of the sacrum and form the promontory of the pelvis.

Viewed as a whole, the human vertebral column forms a kind of pyramid with its base at the sacrum, and its truncated summit at the head. It is not, however, regularly pyramidal; for, as seen from the front, it becomes gradually narrower from the base to the fourth dorsal vertebra; then it widens to the seventh cervical, and then again becomes narrower to the second. In the adult it has well-marked curvatures. (See *Fig.* 7.) From the head it is first curved slightly forwards to the last cervical vertebra; then its dorsal portion forms an arch with its convexity backwards and ending at the last dorsal; and then again in the lumbar region it arches forwards to the base of the last lumbar vertebra. These directions of the column have relations to the naturally erect posture of the human body [MAN]: in correspondence with them the bodies of the cervical and lumbar vertebræ, and their intervertebral cartilages, are thicker before than behind, and those of the dorsal thicker behind than before.

The spine serves several offices in the economy. One is that of guarding the spinal marrow, which, with the roots of its nerves, is enclosed in the long canal formed by the superposed rings of the several vertebræ. The spinal cord being part of a nervous system which consists of a brain and longitudinal axis, both placed on the same side of the digestive canal, is intimately connected with all the rest of the organisation of the animals in which it exists; and being always enclosed in a skull and spinal canal, the vertebral column is taken as the most obvious character of the four classes of animals which have this plan of nervous system. These therefore, namely, mammals, birds, fish, and reptiles, are called vertebrata; and the other portion of the animal kingdom, whatever be the plan of their nervous centres, invertebrata.

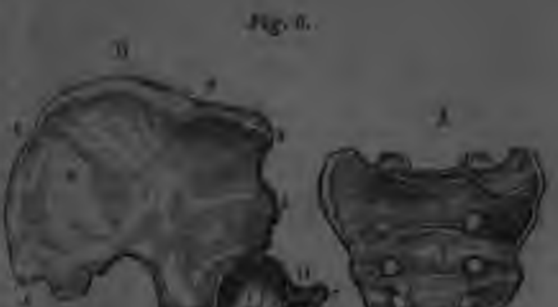
The spine is also the main support of all the rest of the skeleton. The head, the ribs, and the pelvis directly articulate with it; and through the medium of the pelvis and sternum, it suspends both the lower and upper extremities. It is the passive instrument of all the motions of the trunk, and the centre about which each of the limbs as a whole is moved. For these purposes it is adapted by combining strength with flexibility and lightness. Flexibility is obtained by its being composed of so many pieces separated from each other by layers of elastic tissue; and its strength is secured by these layers, which are at the same time firm bonds of union, and by numerous other strong ligaments passing from bone to bone. In its own movements, extent is combined with security by each vertebra (except the first) having but little motion on those next to it; the larger movements being the result of the combination of a number of such small ones. The directions of the processes and the various modes in which they are locked one within another, determine the degrees in which, in each part of the column, the several motions of flexion and extension in all directions, and of rotation, can be performed. The pyramidal form of the whole is adapted to the accumulated weight which the lower vertebræ have to bear. The curvature in the back increases the capacity of the chest. The spinous and transverse processes especially serve for the attachments of muscles of the head, chest, back, shoulders, and pelvis. The elastic cartilages interposed between the bodies break the shock of any violence upon one end of the body, and both they and the interlaminar ligaments tend to keep the spine straight, and so diminish the muscular action necessary to hold the body erect.

The base of the spinal column rests on the top of the sacrum (*Fig.* 6, A), which, though commonly described as part of the pelvis, is indeed a continuation of the column, and is composed of five or six rudimental vertebræ, which after about the tenth year become consolidated. The sacrum (*Fig.* 6, A) has a triangular outline, the base being above; and it articulates with the last lumbar vertebra, so as to form an obtuse angle, the promontory, by means of an intervertebral substance and the other parts common to the rest of the vertebral joints. Its anterior surface, which in the erect posture looks obliquely downwards, is concave, and on it are four or five transverse lines, the traces of the divisions between the bodies of the original vertebræ. At each end of these lines are as many holes (the anterior sacral foramina), which give passage to the anterior branches of the sacral nerves. Outside these holes the sacrum has a smooth surface composed of the coalesced transverse processes of its several vertebræ. Along the posterior convex surface, the sacrum presents corresponding traces of its composition. Its upper border is surmounted by two regularly-formed articular processes which are connected with those of the last lumbar vertebra; and leading downwards from these, in converging lines on either side of the middle, is a series of slight elevations, the traces of other rudimental articular processes. Along the middle line are three or four higher ridges, the traces of spinous processes; and between these and the former are on either side four or five foramina, which give passage to the posterior branches of the sacral nerves. These and the anterior sacral foramina already mentioned are analogous to the intervertebral foramina; and they both lead into the sacral canal, which runs through the whole length of the sacrum, and contains the cauda equina, or tuft of the last roots of the spinal nerves. The outline of the sacral canal is triangular; it grows smaller from above downwards, and is closed in behind by a layer analogous to the arches of the regular vertebræ. It is continuous above with the spinal canal, and below is, in the dry bones, open in the middle line, the arch of the last sacral vertebra being deficient; but in the recent subject is closed by dura mater and fibrous ligament. The sides of the sacrum are thick above, and become gradually thinner below. In the former situation they are marked by large rough oval surfaces, directed backwards and somewhat outwards, by which the sacrum is on either side articulated immoveably with the iliac bones to form the sacro-iliac symphyses. The lower end of the sacrum has a plain oval surface, which is fitted to the upper surface of the first bone of the coccyx.

The coccyx is the lowest part of the whole vertebral column. Its bones form the ulterior frame of the tail in brutes, but in man are small, short, and not more than four or five in number. The uppermost is by far the largest, and is surmounted by two processes called cornua, the extremities of which are adapted to those of two similar processes by which the sides of the lower end of the sacral canal are bounded. The three or four lower pieces of the coccyx have a somewhat oval outline, and are rather deeper than they are broad. Up to a late period of life they are articulated moveably with thin layers of interposed cartilage.

The sacrum and coccyx form the middle posterior part of the pelvis; its sides and front are formed by the bones called ossa innominata (*Fig.* 6, B). Each of these is in the young subject composed of three parts, which are usually described separately as the ilium, or haunch-bone (1), the ischium (9), and the pubis (3). These three meet at the acetabulum (1), the hemispherical cavity in which the head of the thigh bone is lodged, and of which the ischium forms nearly three-fifths, the ilium somewhat more than one-fifth, and the pubis rather less than one-fifth.

Fig. 6.



The ilium forms the upper broad and expanded part of the pelvis. Its outline is somewhat fan-shaped, and in the greater part of its extent it is flat and thin. That surface which is directed forwards and inwards towards the cavity of the pelvis is slightly concave, and gives attachment to the strong iliac muscle by which the thigh is raised towards the pelvis. Its upper border has a thick strong rim (2), the crista ilii, to which parts of the three broad muscles of the abdomen are attached, and which serves for a fixed point towards which the ribs are drawn down by those muscles in strong expirations. The extremities of this rim, and the anterior and posterior edges of the ilium, into which it is continued, have at either end two strong projections for the attachment of muscles of the thigh, which are named spinous processes. In *Fig.* 6, 3 is the anterior superior, and 4 the anterior inferior spinous process; 5 is the posterior superior spinous process, and 6 the posterior inferior. At the posterior part of the inner aspect of the ilium is a rough oval surface, which is fixed behind that at the back of the sacrum, with which its fore part forms the sacro-iliac symphysis (see *Fig.* 2). From the upper part of this symphysis a line, continuous with that of the top of the sacrum and the promontory of the pelvis, passes in a curve across the lower part of the ilium to the upper and inner edge of the pubes, along which it is continued to the middle line at the symphysis pubis. This line, by which the pelvis is divided into an upper and a lower cavity, is called the brim, and the space it encloses is named the upper strait of the pelvis (see *Fig.* 2). At and just below the brim is the thickest part of the ilium; its inner surface, which is opposite the acetabulum, is smooth, and gives attachment to muscles of the pelvis and thigh. The outer and back surface of the ilium (which is represented in *Fig.* 6, B) forms the haunch, that is, that expansion of bone which is felt above the hip-joint. It is marked by curved lines for the attachment of the strong glutei muscles of the buttock, and of the ligaments connecting it with the sacrum and last lumbar vertebra. At its lowest and narrowest part it swells outwards, and is then suddenly and deeply hollowed, to form the upper part of the wall of the acetabulum. In this cavity it is united with the pubes before, and the ischium behind, by flat surfaces, which in the adult bones are indicated only by slightly elevated lines tending to the deepest part of the cavity.

The ischium is the bone on whose lowest part, or tuberosity, the body rests in sitting. It is described as composed of two principal portions: a body (7), consisting of the tuberosity and the thick strong part above it; and a ramus (8), which passes from the tuberosity obliquely upwards, forwards, and inwards. The upper part of the body is united to the lower part of the ilium, and its outer and anterior surface is deeply hollowed to form the lower and back part of the acetabulum. At its posterior and inner border there is a strong pointed process, the spine of the ischium (9), to which one of the main ligaments of the pelvis, the lesser sacro-sciatic, is attached. Above the spine, the body of this bone and the adjacent posterior border of the ilium as far as its posterior inferior spinous process, are cut out in a crescentic form; they thus form the ischiatic notch, and, with the ligament just mentioned and the outer border of the sacrum, enclose an oval aperture, the great ischiatic foramen, through which there pass from the pelvis to the thigh the pyriform muscle, and the gluteal, ischiatic, and pudic blood-vessels and nerves. Below the spine, another foramen, the lesser ischiatic, is enclosed between the same and another stronger ligament, the great sacro-sciatic, and the lower part of the body of the ischium; through this, together with some vessels and nerves, passes the internal obturator muscle, which, on its way to the femur, winds round a smooth oval surface on the back of the ischium directly below its spine. The posterior thick surface of the body is rough for the attachment of muscles, especially those of the ham-strings which form the greater part of the back of the thigh. From the lowest part of the tuberosity, and forming an acute angle with it, ascends the ramus, which at its anterior extremity (10) unites with the descending ramus of the pubes.

The pubes forms the anterior part of each os innominatum, and is composed of a body (11), and a descending ramus (12). The body is the upper, anterior, and larger part. At its outer extremity it articulates with the ilium just below the anterior and inferior spine, from which it descends in an even gentle curve, over which the iliac and psoas muscles, the crural vessels, and one of the principal nerves of the thigh, pass beneath the crural arch. Its outer end is hollowed to form part of the acetabulum. The horizontal part of the body has a somewhat pyramidal form with three sides. Along its posterior and upper border is the line which forms part of the brim of the pelvis. Near the termination of this line is an elevation, the spine of the pubes, for the attachment of one end of the crural arch, the strong ligament already mentioned, whose other end is fixed to the anterior superior spine of the ilium. The inner ends of the bodies of the two pubic bones are opposed by flat oval surfaces, which, with ligaments and a strong intermediate cartilage, form the symphysis pubis. From below and the side of this, the ramus descends outwards and backwards to meet the ascending ramus of the ischium, with which it forms one flat and thin beam. Between these rami below, the body of the pubes above and on the inner side, and the meeting of the pubes and ischium at the acetabulum on the outer side, is an oval aperture, the foramen ovale or obturatorium (13), which in the recent body is nearly closed by the obturator ligament, and of which the borders, as well as the surfaces of the ligament, give attachment to the two obturator muscles, which thence proceed to the back of the thigh-bone, which it is their office to rotate outwards. The space included between the rami of the pubes and ischia on either side and in front, and the great sacro-sciatic ligaments, passing from both borders of the sacrum and coccyx to the tuberosities of the ischia, behind, is named the lesser aperture or strait of the pelvis. The meeting of the two rami in the middle line makes the angle of the pubes.

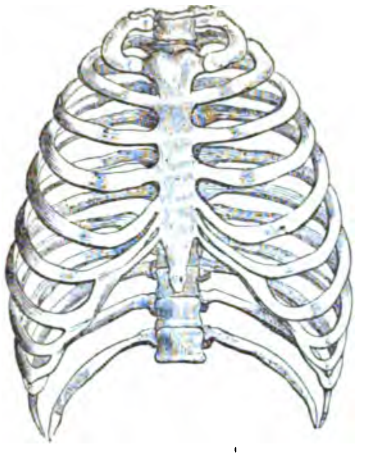
The general purposes served by the pelvis are—to support the abdominal viscera, to enclose and guard those in its own cavity, to give insertion to muscles of the abdomen, back, and thighs, and to be such an intermedium between the rest of the trunk and the lower limbs that the latter may move freely and yet firmly support the body. For the three first of these purposes its adaptation is obvious. For the last, the pelvis is fitted by its posterior half forming an arch on whose summit the spine is supported, and whose pillars rest on the heads of the thigh bones. Of this arch the sacrum, impacted between the ilia and held firmly by the ligaments of the symphysis, forms a kind of key-stone, fitted tightly enough to bear, through the medium of the spine, the weight of the trunk and of great additional burdens. The pillars of the arch are terminated by the acetabula, which rest on the femora; and the direction in which the weight is thus transmitted from the sacrum to the thighs is that in which the strongest and thickest part of the ilium (in the line of the brim of the pelvis) is placed. Each acetabulum forms part of a sphere hollowed out at the meeting of the three component bones of the os innominatum. Its depth is increased at the upper and back part (where the chief pressure falls) by the swelling out of the ilium; and all round, by the cotyloid ligament, a band of tough fibrous tissue, by which the bone is bordered. It in a measure envelopes the head of the femur, which is fitted into it air-tight, and so closely that even after all the ligaments are removed, they cannot without much force be separated. In the dry bones however the border of the acetabulum is not a complete circle; there is a notch where the ischium and pubes meet at the fore and lower part, to which the round ligament is in part attached. The head of the femur thus moves in the freest manner in the acetabulum by a perfect ball-and-socket joint; and if the thigh-bones be fixed, then it is by the rolling of the pelvis on their heads that the body is swayed *en masse*.

The particular circumstances in the structure of the pelvis which are especially adapted to the erect posture, such as its hollow expanded sides, the oblique direction of its cavity, its width, the strength and position of the tuberosities of the ischia, &c., are described in the article **MAN**. Its relation to gestation and parturition may also be here omitted, except to say that it is in reference to its share in these processes that the pelvis is larger in all its dimensions in women than in men.

The last main division of the trunk is the Chest or Thorax, composed of the dorsal vertebræ behind, the sternum in front, and the 12 ribs and their cartilages on either side. (See *Fig.* 7.) All the ribs articulate with the spine, but only the 7 uppermost on each side have distinct connections with the sternum; these are therefore called True ribs, and the five lower on each side False ribs.—Of these last, the 3 upper have their cartilages united before they reach the sternum; and the two lower, which are sometimes called floating ribs, have short cartilages which are not attached to the sternum at all.

In each of the greater number of the ribs there are a head, a neck, a tuberosity, an angle, a body or shaft, and a cartilage. The head is that part which articulates with the vertebral column. It is larger than the neck, and its articulating surface has a somewhat oval outline, and is divided into two parts by a transverse elevation. This elevated line corresponds to the intervertebral cartilage, to which it is affixed

Fig. 7.



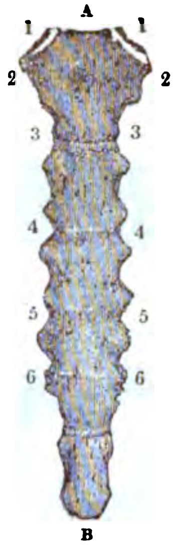
by a ligament. The motion permitted at the joint between the head of the rib and the border of each of the vertebræ next above and below it is not extensive; but it is sufficient to give the body of each rib, which has the relation of a long lever to the joint as a fulcrum, a wide sweep outwards and upwards in the act of deep inspiration. Proceeding onwards from the head, and passing over the neck, which is the smallest and roundest part of the rib, the next object is the tubercle, an elevation on the posterior surface, by which the rib is articulated with the end of the transverse process of the vertebra next below it. Farther outward is the angle, an oblique projecting line at which each rib turns somewhat more upwards and becomes flatter. The remainder of the rib is its shaft. This is thin and flat; its surfaces are both nearly smooth, the outer being slightly convex, the inner as slightly concave; the upper edge is rounded; the lower (which is also directed somewhat outwards) is sharp, and, from the angle inwards, is grooved on its inner aspect, where the intercostal vessels and nerves lie. The end of the osseous part of each rib has a rough surface, to which is adapted one end of the costal cartilage, of which the other end (except in the instances already mentioned) is attached to the sternum. The costal cartilages have each the same general form and direction as the part of the rib to which they are appended; they may be regarded as mere prolongations of the ribs, the purpose of their being cartilaginous instead of bony being that of giving more elasticity to the walls of the chest. Each of them, except the first, is articulated with a slight capacity of motion to a depression on the border of the sternum.

The direction of the body of the rib is first downwards and backwards, forming an arc of a small circle, to the angle, at or near which it seems twisted on itself, and then sweeps round forwards and a little upwards in the arc of a larger circle. The distance from the head to the part at which this change of direction takes place, is greater in the lower than in the upper ribs, and in the same progression is gradually increased the obliquity of the ascent of the cartilages towards the sternum. The length of the ribs and their cartilages together becomes regularly greater from the first, that is, the uppermost, to the seventh or eigthth, the rest become gradually shorter, especially in their osseous parts.

Some of the ribs have particular characters in which they deviate from the general description. The heads of the first, eleventh, and twelfth, have but one articular surface, being each connected with but one vertebra; the first and twelfth have no angles, the second and eleventh scarcely any. The first forms nearly the half of a circle of a very small radius compared with those of the ribs below it; its surfaces are horizontal; the upper is marked by two grooves over which the subclavian artery and vein pass, and by an impression between them to which the anterior scalenus muscle is attached; the lower surface has no groove; the sternal end is very broad; the head is small. The second rib presents characters intermediate between those of the first and those of the true ribs below it.

The Sternum, or breast bone, is single only in the adult; in youth it is composed of at least two pieces (of which the upper (*Fig.* 7*, A) is named manubrium), and in the fœtus of many more. Considered as one bone, its form is elongated, broader and thicker above than below, where it terminates in a long narrow process, which is generally cartilaginous, and is named the ensiform or xiphoid cartilage (B). The anterior surface of the sternum is marked by four transverse lines (3, 4, 5, 6) which indicate the divisions between the five principal parts of which it is composed. These marks are repeated on the posterior surface. Along its borders there are (proceeding from above downwards), first, at each of the angles between its upper and lateral edges, a shallow depression (1) into which the extremity of the clavicle is received; then immediately below this an oval depressed surface (2) to which the cartilage of the first rib is fixed; and lastly, along each side six other similar surfaces separated by notches with which the cartilages of the six following ribs articulate. Of these six, the four upper are placed at the ends of the transverse lines; so that each of these ribs articulates at its sternal end with two pieces of the sternum, just as, at its other extremity, it articulates with two vertebræ.

Fig. 7*.



The general structure of the chest, and its adaptation to the movements of breathing, the most important function in which it is particularly engaged, are described in the article Respiration.

The Bones of the Skull are divided into two chief sets,

Fig. 8.

those of the Cranium, or case for the brain, and those of the Face. They are represented in the annexed sketches separated, yet in their natural relative positions, in three different aspects: in *Fig.* 8, as seen from the front; in *Fig.* 9, as seen in profile; in *Fig.* 10, as seen when, after removing the top of the skull, one looks from above upon the bottom of its interior

Fig. 9.

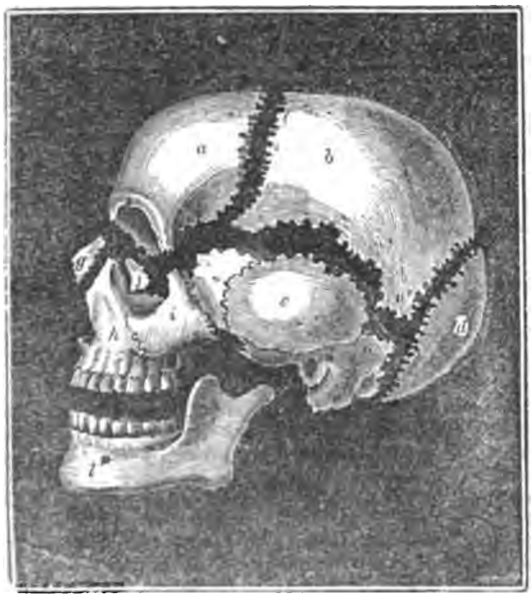


Fig. 10.

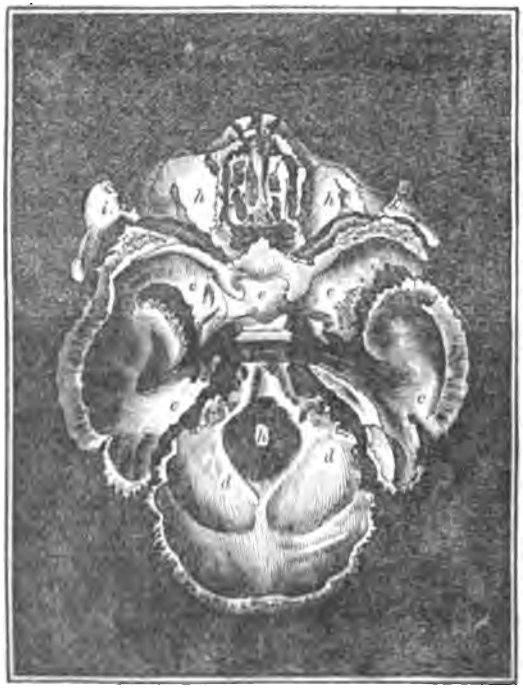
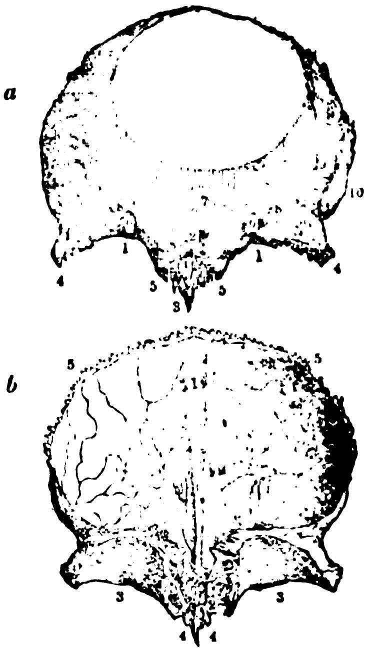


The Bones of the Cranium are, the Frontal (*a*), the two Parietal (*b*), the two Temporal (*c*), the Occipital (*d*), the Sphenoid (*e*), the Ethmoid (*f*); those of the face are, the two Nasal (*g*), the two superior Maxillary, or upper Jawbones (*h*), the two Palate, the two Malar (*i*), the two Lacrymal (*j*), the two inferior Turbinated, the Vomer (*k*), and the inferior Maxillary (*l*).

The frontal bone (*Fig.* 11, *a*, *b*) forms the forehead and the roof of the orbit. The front or frontal portion is the larger. Its anterior surface, which is represented in *Fig. a*, is convex and smooth: it is bounded below by two arched, thick, and rounded borders, separated by a rough notch in the middle line. The borders (1, 1) are called the orbital arches or ridges, and they form the front and prominent part of the orbits. The notch (2) is named the nasal notch; on either side of it are fixed parts of the upper jaw, and in the middle the nasal bones, which rest behind on a process called the nasal spine (3). At the outer extremity of each orbital arch is the external angular process (4, 4), and at the inner extremity the internal angular process (5, 5); the former is articulated with the malar, the latter with the upper jaw and lacrymal bones. Near the internal process is the Supra-orbital Foramen or notch (6, 6), through which the frontal vessels and nerve pass from the orbit to the forehead. Just above it and by its side is a rounded elevation, the frontal protuberance (7), which marks the situation of the subjacent frontal sinuses, air-cavities, between the two layers of which the bone is composed. They vary much in size in different persons, and communicate with the interior of the nose. On either side of the middle line, and extending above the orbital ridge, the surface of the bone is again elevated in the superciliary ridge (8, 8), an arched prominence behind the eyebrow. The rest of this anterior surface is smooth and even, but in different persons its form is as varied as that of any other feature. On either side it terminates rather abruptly with a curved border (9), which forms the front boundary of the Temporal fossa (10), and behind which there is a smooth surface, to which the fore part of the temporal muscle is attached.

Fig. 11.

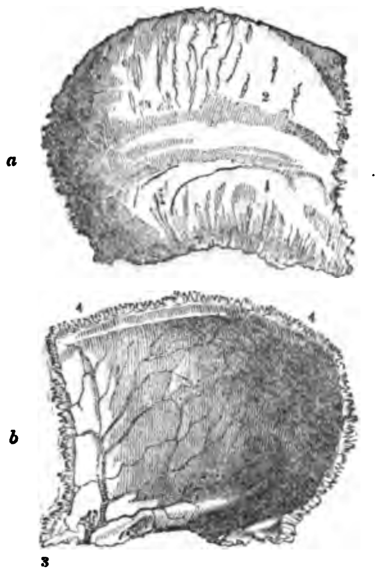


The posterior or cerebral surface of the Frontal bone (*Fig.* 11, *b*) is concave. Along the middle line there is a broad groove (1), in which a part of the longitudinal sinus [BRAIN] lies; and at the fore and lower end of this a ridge, to which a process of dura mater called the falx is attached. The ridge ends at a hole named the Foramen cæcum. The rest of this surface is marked by depressions and ridges fitting to the convolutions of the surface of the brain.

The orbital portions (*b*, 3, 3,) of the frontal bone are thin plates extending almost horizontally backwards from the orbital arches. Between their inner borders is a space, the ethmoid notch, into which the ethmoid bone fits, and just anterior to which are the apertures (4, 4) leading into the frontal sinuses. The under surface of each plate is concave, smooth, and even; and has at its outer and fore part a shallow depression, in which the lachrymal gland is lodged, and at its inner and fore part a mark to which the pulley of the trochlearis muscle of the eye is attached. The upper surface is marked in correspondence with the irregularities of the under part of the anterior lobe of the brain, which rests upon it.

The posterior and upper margin of the frontal bone (*b*, 5, 5) is joined by the coronal suture to the two parietal bones; and it is cut obliquely in such a manner that its edges rest upon theirs above, and theirs overlap its below. The lower part of this margin is covered by the alæ of the sphenoid, where they rise into the temporal fossæ. The frontal is usually in the adult only a single bone, composed (as all the bones in the middle plane of the skeleton are) of two equal and similar halves: these are developed separately, and they sometimes remain undivided by a continuation of the sagittal suture which passes from between the two parietal straight down the middle of the frontal.

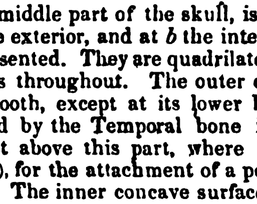
Fig. 12.



The construction of the Parietal bones, which form all the upper and middle part of the skull, is very simple. In *Fig.* 12 at *a* the exterior, and at *b* the interior, of the right parietal is represented. They are quadrilateral, and of nearly equal thickness throughout. The outer convex surface is everywhere smooth, except at its lower border (1), where it is overlapped by the Temporal bone in the squamous suture, and just above this part, where there is a slight arched ridge (2), for the attachment of a portion of the temporal muscle. The inner concave surface has impressions of the cerebral convolutions, and a deep branching groove, which, beginning at the fore and lower angle (3), thence ramifies diffusely. It lodges the middle meningeal artery of the dura mater. [BRAIN.] Along the upper border is a broad shallow groove (4), which lodges part of the longitudinal sinus, and is continuous with that on the interior of the frontal bone. The borders of the parietal bones are all, except the lower, deeply and irregularly indented; and by the dovetailing of such irregular teeth, they form, with the frontal bone in front, the coronal suture, with the occipital behind, the lambdoidal, and, in the middle line at their own meeting, the sagittal.

The Temporal Bones (*Fig.* 13, as seen from without) are placed in the middle, lateral, and inferior parts of the skull. They present each three distinguishable parts, which in the fœtus are separated: namely, a Squamous portion (1), which forms the middle of the side of the skull; a Mastoid portion (2), which forms the thick protuberance that may be felt behind the ear; and a Petrous portion (not visible in *Fig.* 13, but in *Fig.* 10 marked *c*), which passes from the lower part of the squamous forwards and inwards in the base of the skull. The squamous bone or portion has a roundish form. Its upper edge covers in the lower border of the parietal. Its exterior surface is smooth, and gives attachment to some of the temporal muscle. At the hinder part of its lower border is an oval aperture (3), leading to the meatus auditorius externus [EAR], a passage which goes forwards and inwards to the tympanum in the interior of the petrous portion. Immediately anterior to this, and under the fore-part of the bone, is the Glenoid cavity (4), a deep transversely oval hollow, with which the condyle of the lower jaw is articulated, and behind which is a narrow chink, the Fissura Glaseri, separating it from a strong ridge which runs along the upper surface of the petrous bone. In front of the glenoid cavity is a prominence, which forms its border, the Tuber articulare (5); and from its outer part there proceeds horizontally forwards, as if springing from the tuber and two other slightly elevated lines running backwards, a long narrow portion of bone, the Zygomatic process (6), the enlarged end of which joins a short process of the malar bone to form the zygoma, an arch beneath which the temporal muscle plays, and whose size and strength are generally in direct proportion to those of that muscle, and to the force with which the lower jaw is worked in gnashing with the teeth.

Fig. 13.



Behind the meatus auditorius is the mastoid portion. It is prolonged downwards in a strong conical projection, the mastoid process (7) giving insertion to muscles upon and just above it, and of which the interior is occupied by numerous cells communicating with the cavity of the tympanum. Behind and within the mastoid process is the digastric groove, to which the muscle of the same name is attached; and farther back another more shallow groove for the trachelo-mastoid muscle.

The cerebral surface of the squamous portion has a very obliquely cut and groved upper border, which articulates with the lower border of the parietal bone. On the same surface of the mastoid portion is a deep fossa, which lodges part of the lateral sinus. Both are marked by the impressions of the brain.

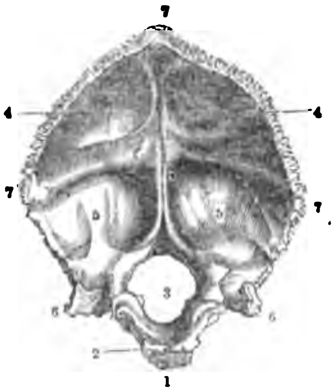
The Petrous process or portion of the temporal bone (*Fig.* 10, *c*), has received its name from the peculiar hardness of its tissue. It has the form of an irregular three-sided pyramid, directed from either side forwards and inwards, and fitting, at the base of the skull, into the angle left between the sphenoid and the occipital bones (*e* and *d*). Its base is affixed to the interior and lower part of the squamous bone; its summit fits in the apex of the angle just mentioned. On its posterior surface the most prominent object is the oval aperture of the meatus auditorius internus, the passage leading to the internal ear, and traversed by the auditory and the facial nerves. On the anterior surface there are a shallow groove leading to a small hole, through which the Vidian nerve and blood-vessels pass, a slight hollow on which the Gasserian ganglion of the fifth pair of nerves lies, and a prominence which indicates the position of the superior semicircular canal of the ear. On the inferior surface, which is placed outside the skull, there are seen, at the posterior and outer border, a deep fossa (the Jugular), in which the upper part of the internal jugular vein is lodged; before and on the inner side of this, and separated from it by a prominent ridge, a large oval aperture, through which the internal carotid artery passes into a tortuous canal, whose other extremity is at the very apex of the bone; between the jugular fossa and the mastoid process a hole, the Stylo-mastoid foramen, through which the facial nerve passes on its way to the face, after penetrating the bottom of the meatus auditorius internus; and just anterior to this, a long-pointed process, the Styloid (8), to which several muscles and ligaments are attached, and whose base is surrounded by an irregular sharp-edged elevation, the Vaginal process (9).

The anterior border of the petrous bone is articulated with the posterior part of the ala of the sphenoid, leaving an intermediate space, named foramen lacerum medium; the posterior border is similarly united with the side of the basilar process of the occipital bone, leaving another space, the foramen lacerum posterius, through which the internal jugular vein and the nerves of the eighth pair pass. Near the angle where the anterior border joins the squamous bone is an irregularly shaped aperture, to which the cartilaginous part of the Eustachian tube is affixed.

The small bones of the internal Ears, and all the other parts of the organ of Hearing, which lie within and near the petrous bone, are already described. [EAR.]

The Occipital Bone (*Fig.* 14 is a view of the internal surface) forms the posterior and lower part of the middle of

Fig. 14.

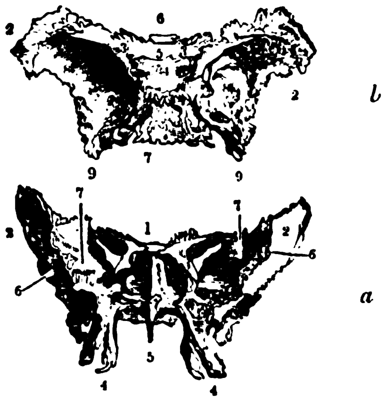


the skull, a portion being at the outer wall and a portion at the base. Its lower and anterior part is narrow, and has a rough surface (1) in front, which is united with the body of the sphenoid bone. Viewing it at its internal surface, it presents, as one proceeds from this surface backwards and upwards, a smooth hollow surface, which gradually widens, and is limited behind by a large oval opening. The surface (2) is that of the Basilar Process, in which the medulla oblongata and pons Varolii [Brain] rest; the aperture (3) is the Foramen magnum, through which the medulla passes into the spinal canal, where it is continued into the spinal cord. By the sides of this foramen, near where the basilar process joins the back and expanded part of the bone, there are four foramina, two on either side, the anterior and posterior condyloid foramina, of which the anterior transmit the hypoglossal nerves, on which the motions of the tongue depend, and the latter give passage to veins communicating with the vertebral veins. Opposite the fore part of the foramen magnum the basilar process suddenly widens into the greater portion of the occipital bone, which forms the back of the head. In this part are four large hollows (4, 4, 5, 5), of which the two upper lodge the surfaces of the posterior lobes of the cerebrum, the two lower those of the lobes of the cerebellum. They are separated by two ridges, which bisect each other at nearly right angles. The upper part of that which runs vertically has attached to it a portion of the falx major, and to its lower part is affixed the falx cerebelli; that which runs transversely gives insertion to the back part of the tentorium cerebelli, whose anterior borders are fixed to the upper angles of the petrous bone. By these ridges are broad shallow grooves, which lodge parts of the sinuses of the brain. By the upper half of the vertical ridge is the extremity of the longitudinal sinus, the grooves for which, in the frontal and parietal bones, are already mentioned, and which, at the Internal Occipital spine, where the ridges bisect each other, meets the inferior longitudinal and other sinuses, to form what is named the Torcular Herophili, their common point of meeting. From this there proceed the two lateral sinuses, which run above the transverse ridge on either side, then cross over the posterior inferior angle of each of the parietal bones, then lie for a short distance on the inside of the mastoid portion of the temporal, from which they pass through the foramen lacerum posterius by a special aperture, marked by a deep notch in the border of the occipital bone, near the angle (6), which separates the basilar from the other portion.

The inferior and outer surface presents on the basilar process numerous irregularities, from which the back part of the pharynx is suspended, and into which certain muscles and ligaments of the front of the spine are inserted. The foramen magnum has here an even and grounded border; and by its sides two elevations, each with a smooth convex oval surface, whose larger axis is directed forwards, inwards, and downwards; these are the Condyles, by which the occipital bone articulates moveably with the first vertebra of the spine. Near these also are the outer orifices of the anterior and posterior condyloid foramina, and around them very rough surfaces for the insertion of ligaments and muscles. On the outer surface of the expanded posterior portion of the bone are three ridges, one of which passes from the border of the foramen magnum backwards and upwards in correspondence with the internal vertical ridge, and is crossed on its way by two transverse arched ridges. At the crossing of the upper of these two is a sharp prominence, the occipital spine or protuberance. The two transverse ridges and the spaces below them give attachment to muscles; the spine, to the ligamentum nuchæ. Above the upper ridge the surface is smooth.

The upper and lateral borders (7) of the Occipital bone are deeply toothed, and form the Lambdoidal Suture, with the parietal bones above and the mastoid below. In the course of this suture there occur, more often than in that of any other, insulated portions of bone, of various size and form, called Ossa Wormiana, surrounded by margins toothed as in the regular line of suture.

Fig. 15.



The Sphenoid Bone (*Fig.* 10, *e*) is placed in the middle of the base of the skull, and has a very complicate form. *Fig.* 15, *a*, gives a front, and *b*, a back and upper view of it. Its principal parts are described as a body (1, 1), two Greater Alæ (2, 2), two Lesser Alæ (*b*, 3, 3), and, on each side, two Pterygoid Processes (*a*, 4, 4). The body is the central part, and has somewhat the form of a hollow cube. Chief part of its upper or cerebral surface is hollowed, forming what is called the Sella Turcica (*b*, 4), and lodging the pituitary gland. [Brain.] It is bounded at its four corners by bluntly pointed prominences called Clinoid Processes (see *Fig.* 10), to which prolongations of dura mater are attached. Between, and a little in front of the two anterior of these, is a level surface (*b*, 5) on which the commissure of the optic nerves rests, and which has behind a slight elevation, the Olivary process, and in front a pointed one, the Ethmoid spine (*b*, 6) which fits into the Ethmoid bone. The sides of the body slope obliquely downwards towards the great alæ, and the cavernous sinus and internal carotid artery of each side rest against them. The posterior surface (*b*, 7) of the body is rough, and unites with the end of the basilar process of the occipital. The anterior presents the openings of large cells which occupy the whole interior. These are divided by a middle septum (*a*, 5), and are partly closed in by two small portions of bone called Sphenoidal Cornua; where not thus closed, they open into the posterior ethmoidal cells. The under surface of the body is chiefly flat, but has a ridge called the azygous process along the middle line, which fits to the Vomer.

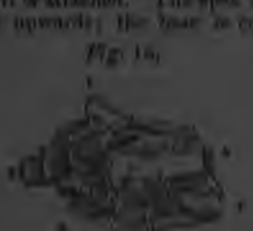
The Greater Alæ (2) are affixed by the sides of the body, and project from it outwards, upwards, and forwards. On each there are three principal surfaces, turned towards the brain, the temple, and the orbit, respectively. The inner or cerebral (*b*, 8) is concave, supports part of the middle lobe of the brain, and presents three particular orifices, namely: the foramen rotundum, near its anterior and inner margin, through which the superior maxillary nerve passes from the Gasserian ganglion of the fifth pair; the foramen ovale, much larger and near the posterior and inner border, through which the inferior maxillary nerve goes from the same ganglion; and the foramen spinosum, near the outer and posterior angle, which transmits the middle meningeal artery. This outer angle (*b*, 9), which fits in between the petrous and squamous parts of the temporal bone (see *Fig.* 10), is named the spinous process. The outer or temporal surface (*a*, 6) is slightly hollowed, and forms part of the temporal fossa, rising up at the lower part of the side of the skull as far as the anterior inferior angle of the parietal bone. At its lower border it turns abruptly inwards at a slight ridge, below which it is continued to the pterygoid processes, and forms part of the zygomatic fossa; its posterior border articulates with the squamous, its anterior with the frontal bone. The anterior or orbital surface (*a*, 7) is flat and smooth, and forms part of the outer wall of the orbit, where it articulates with the malar, frontal, and upper jaw bones.

The Lesser *Alæ* (6, 7, 8) are long, narrow, sharp-pointed processes projecting horizontally outwards from the front and upper part of the body. Internally and behind they bear the anterior clinoid processes, beneath which are the optic foramina for transmitting the ophthalmic arteries and the optic nerves from the commissure to the orbit. The upper surface of these alæ is flat, and supports part of the brain. The anterior border is articulated with the orbital plates of the frontal bone on either side, and in the middle, where the ethmoidal spine projects, with the ethmoid bone. The posterior border lies in the Fissura Sylvii, between the anterior and middle lobes of the brain. The under surface is smooth; between it and the anterior edge of the great ala is a gap, the foramen lacerum anterius, transmitting nerves and a vein to the orbit.

The Pterygoid processes (9, 4, 4) are directed downwards from the under and outer part of the body. On each side there are two lamellæ, an external and an internal; they are long and narrow quadrilateral plates nearly meeting in front, where they articulate with the palate bone, and diverging behind so as to leave a space, in which the internal pterygoid and circumflexus palati muscles are attached. The internal and longer of the lamellæ has at its lowest extremity a hook, the Hamular process, round which, as on a pulley, the tendon of the last-mentioned muscle plays. At the upper part, where the pterygoid processes join the body, is a canal, the Vidian, running from before backwards and transmitting the Vidian nerve.

The Ethmoid Bone (*Fig.* 16, *c*) is situated in the front and middle part of the base of the skull between the orbits. *Fig.* 16 gives a profile view of it from the left side. It presents very different aspects, and for the most part is of a very light spongy texture. Its upper surface, which is presented to the brain, has in front and in its middle line a strong triangular process, the *Crista Galli* (1), to which the front of the falx cerebri is attached. The apex of this process is directed straight upwards; the base is continuous below with the perpendicular or nasal plate (2), which divides the ethmoid bone into two equal lateral halves, and which, with the Vomer, which it joins below, forms the greater part of the septum of the nose. The Crista Galli, sloping forwards and backwards, is gradually lost behind, where the ethmoid bone receives the spine of the sphenoid. On either side of it is a narrow quadrangular plate (the Cribriform plate), on which the bulb of one of the olfactory nerves rests. Each is perforated by a number of holes through which the branches of the olfactory and another smaller nerve pass to the interior of the nose. In front, and along part of the border of each plate, are the orifices of numerous cells which, in the entire skull, are closed in by the frontal bone and its orbital plates, and communicate with the frontal sinuses.

Fig. 16.



The surface of the upper part of each side of the ethmoid bone is formed by a thin smooth quadrilateral plate, the orbital plate (3), which forms great part of the inner wall of the orbit, and unites above with the corresponding plate of the frontal, leaving two small apertures, the anterior and posterior internal orbital foramina, for the passage of small nerves and vessels; in front with the lacrymal, below with, laterally, portions of the upper jaw and palate bones, and behind with the sphenoid. Between the orbital and nasal plates, each half of the bone is formed of cells and folds of very thin lamellæ, which form part of the chambers of the nose, and have the olfactory membrane and nerves spread out upon them. [SMELL.] The principal parts are the middle turbinated or spongy bone (4), a roll of thin bone, which forms the lower border of the cells; and a smaller but similar roll higher up, and confined to the back part, called the superior turbinated or spongy bone (5). Under each roll at its posterior part is a passage to the cells, called respectively the Superior and the Middle Meatus of the nose. The ethmoidal cells communicate in front with the frontal, and behind with the sphenoidal cells or sinuses.

The six bones just described enclose the Brain, forming a cavity whose size, compared with that of the crania of brutes, is one of the most distinguishing marks of the human species. To the protection of the important organs within it, as to their chief office, everything in the structure and arrangement of the bones of the cranium is adapted. Those parts of them which are exposed to direct external injury are formed of three layers, namely, an outer and inner table, and an intermediate diploe.* The outer table is formed of bone of ordinary compactness, such as is not liable to be cracked by moderate shocks; the inner, of much harder and more brittle bone (whence its name of Tabula vitrea), which may be more easily cracked, but less easily cut or pierced. The diploe is of a soft spongy tissue, calculated to lessen the vibrations that are produced by blows on the outer table, before they reach the inner and more brittle one. The arrangement is thus similar to that by which one might safely enclose a substance liable to injury either from being shaken or cut, within an inner case of hard porcelain, a middle one of soft leather, and an outer one of tough wood.

The formation of the sutures seems to have the same end. The outer tables of the exposed bones have their edges finely dovetailed, and are thus so immovably held together that none but a violently expansive force exercised at once on the whole interior of the cavity can separate them. The inner tables are simply opposed with a very thin intermediate layer of cartilage; an arrangement which, as Sir Charles Bell (who has written most ingeniously on this subject in his 'Animal Mechanics'), says, is often imitated in works of art, in which tough materials, such as wood, are joined by mutually fitting dovetailings; and brittle ones, such as glass or marble, by smooth edges and a layer of cement. A similar mode of opposition is seen between all the bones of the skull that are not exposed to direct violence.

The top of the skull presents transversely an arch formed by the two parietal bones (see *Fig.* 9), whose most prominent parts, like those of the frontal, occipital, and others, are stronger and thicker than any where; a circumstance adapted for greater resistance to force, whether applied directly against these parts, or to the summit of the arch from whence it would fall chiefly on them. The strength of this arch is further secured by the lower parts of the parietal bones being held in by the overlapping upper borders of the temporal and sphenoidal bones, other parts of which, passing across the base of the skull, hold the parietal bones, which by pressure from above might be made to start outwards or pushed inwards, as beams hold the walls of a house from being driven either in or out by the weight of the roof. Taking the whole upper part of the skull as a dome, the same strength of resistance to superincumbent pressure is obtained at every part by nearly similar means, especially at the coronal suture, where, as has been already said, the parietal bones overlap the frontal at the supports of its arch, and are themselves overlapped by it at the summit of their own. In this regard also may be noticed the strength and thickness of the angular processes, and of the orbitar arches extended between them (see *Fig.* 11), which serve as supports for the *front* of the dome; and the thickening of the bones along the course of the longitudinal and lateral sinuses, resembling groins in masonry.

The relations of the skull to the erect posture, the adaptations of the ethmoid and sphenoid bones to the sense of smell, and the arrangements of the base of the skull in reference to the ear, the several nerves, &c., are considered elsewhere. [BRAIN; EAR; MAN; SMELL, &c.]

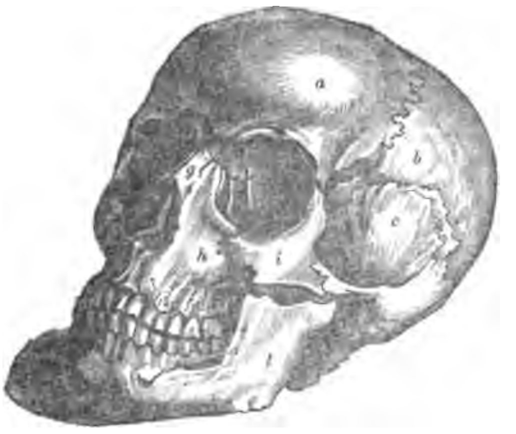
The *second* chief division of the Skull includes the bones of the Face, the principal of which are represented in *Figs.* 9 and 17.

The Nasal Bones (*Figs.* 8, 9, 11, *g*) form the upper part of the bridge of the nose. They are narrow and quadrilateral; thick above, where they fit into the nasal notch of the frontal bone; broad and thin below. The outer border of each articulates with that of the ascending process of the upper jaw-bone; the inner is in contact with that of the other; the lower are in contact with the cartilages that form the rest of the groundwork of the nose. The anterior sur-

---

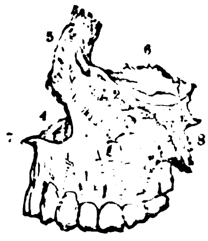
* This arrangement does not occur in either the child or the old person. In the former all the bones are soft and uniform; in the latter the diploe is filled up by hard bone, and the whole cranium is therefore more liable to fracture.

Fig. 17.



face is concave from above downwards, and convex from side to side; the posterior has opposite directions, and in the middle line, where the two bones are in contact, is applied on the nasal spine of the frontal, and the edge of the perpendicular plate of the ethmoid bone.

Fig. 18.

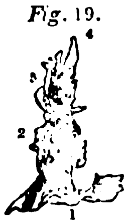


The Superior Maxillary or Upper Jaw bones (*Figs*. 8, 9, 17, *h*) form the greater part of the front of the face. *Fig*. 18 gives a view of the outer part of that of the left side. This surface is bounded below by a narrow border, the Alveolar border or process (1), in which the upper teeth are set in their sockets. Its outline is an elliptical arc, and from it the outer surface ascends to the orbit, of which it forms the inner and great part of the lower margin (2). It is unevenly depressed in two or three places for the attachment of muscles of the face. At the outer part, near the orbit, it presents a rough surface, the Malar eminence (8), by which it is united with the cheek-bone. Below and in front of this is a depression called Fossa canina, and on its inner side, just below the orbital margin, is the Infra-orbital foramen, through which the superior maxillary nerve passes to the face. The anterior border of this external surface first ascends vertically where the two bones are in contact in the middle line (see *Fig*. 8); then is suddenly cut out in a crescentic arch (4) so as to leave between the two the large aperture into the nasal cavities, and then again ascends where the upper maxillary bone unites with the nasal of the same side. This ascending part is called the nasal process (5); its summit is fixed in the nasal notch of the frontal bone; its outer surface looks towards the orbit, is deeply grooved, and with the lacrymal bone, to which its posterior border is attached, forms a channel for the lacrymal duct; its inner surface is directed towards the cavity of the nose, has an oval roughness which is united with the inferior turbinated bone, and above closes some of the anterior ethmoidal cells. Below and behind the malar eminence the surface is excavated to form part of the zygomatic fossa; and above this it swells out and is perforated by numerous foramina, through which the nerves of the upper teeth pass.

The upper, or orbitar, surface (6), consists of a thin plate, forming the floor of the orbit, and presenting a groove which leads to the infra-orbital canal, and a depression for the insertion of the inferior oblique muscle of the eye. The under or palatine surface is rough and concave, and forms part of the roof of the mouth. Its outer border is arched, and bounded by the alveolar process; the inner is straight, and is set against that of the opposite side in the middle line; the posterior is united with the corresponding process of the palate bone. The inner or nasal aspect presents, below, a rough surface by which the bone is united to its fellow on the opposite side, and which is deeper in front than behind. It is surmounted by a ridge which extends from before backwards, and between which and that of the other bone is a narrow groove to receive the vomer. The anterior part of the ridge (7) is called the anterior nasal spine, and close by it is the foramen incisivum, which leads down to the roof of the mouth, and transmits the anterior palatine nerve. On the outer side of the ridge is a concave smooth surface, the upper surface of the palatine process, of which the lower surface forms, as already said, the roof of the mouth. From the outer part of this surface, which forms part of the floor of the nostrils, the bone rises almost vertically towards the nasal spine and the inner edge of the orbital plate, and, at about its middle, presents a large aperture leading into the Antrum Highmori, a cavity occupying the whole interior of the body of the bone.

The Palate bones are placed backward between the superior maxillary and the pterygoid processes of the sphenoid. The lower, horizontal, or palatine portion (1) of each is attached behind the palatine process of the upper jaw, to which it is similar in form, and it completes the back part of the roof of the mouth or hard palate, and of the floor of the nostrils. Its posterior border has the Velum palati [PALATE] attached to it: its under surface presents two foramina, through which the posterior palatine nerves pass. From its outer border a thin plate (2) ascends vertically; where it commences there is, behind, a rough process (3), articulating with and filling up the gap between the pterygoid processes of the sphenoid. (*Fig*. 15, *a*. 4, 4.) The nasal or inner surface of this ascending portion articulates with the inferior turbinated bone, and forms part of the outer wall of the nostrils; the outer surface articulates with the back and inner part of the superior maxillary bone, and forms with it the posterior palatine canal. The upper border has a notch, which, in the entire skull, is completed by the sphenoid bone into a hole, called the spheno-palatine, for the transmission of nerves of the same name: behind it is a triangular process (5), of which one surface articulates with the body of the sphenoid; and before it is another (4), of whose surfaces one closes some of the ethmoid cells, and another forms a small part of the back and floor of the orbit.

Fig. 19.



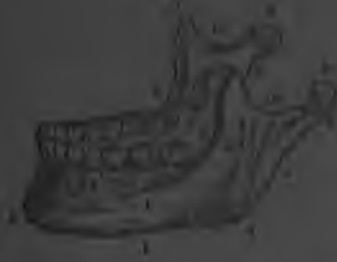
The Malar or Cheek Bones (*Figs*. 8, 9, 17, *i*) form the most prominent part of the cheeks. The form of each is quadrangular. The front surface is slightly convex, and has small apertures for vessels and nerves: the back covers the front of the zygomatic fossa: the upper surface is the narrowest, and forms part of the floor of the orbit, of which also part of the front border is formed by the upper margin of this bone. By its posterior surface and inner border the malar is united to the upper jaw-bone, as already described; and by its posterior and outer angle to the zygomatic process of the temporal bone (*Fig*. 13, 6), with which it forms the zygoma.

The Lacrymal Bones (*Fig*. 9, *j*) are two small thin lamellæ of bone at the fore part of the inner wall of the orbit. Each of them in some measure resembles a thumb nail, whence they are also called Ungual Bones. Each is composed of two parts: the anterior is deeply grooved on the surface turned towards the orbit, and contributes to the formation of the lacrymal canal with the nasal process of the upper jaw-bone, with which its anterior margin articulates. The posterior part is flat, and closes those of the ethmoidal cells which lie anterior to its orbital plate. The posterior margin of this part articulates with the ethmoid bone, the upper with the orbital plate of the frontal, and the lower with that of the upper jaw-bone.

The Inferior Turbinated or Spongy Bones are thin rough lamellæ, whose lower border is rolled up somewhat like a scroll. They lie within the nasal cavities, and, except in being larger, they closely resemble the bones of the same cones which are appended to the ethmoid. They are attached on either side to the inner surfaces of the nasal processes of the upper jaw and palate bones, and, at the [illegible], to the [illegible] and the lower margin of the orbital plates of the ethmoid bone; from these they are suspended before the entrance of the Antrum, which, as has been [illegible]. Like all the bones which form part of the cavities of the nose, they are covered by mucous membrane. Towards their inner concave surface runs the inferior meatus of the nose.

The Vomer (Fig. 5, 4) is a thin quadrilateral plate which forms a considerable part of the middle partition of the nose. Its upper border is the thickest, and is articulated with the azygos process and under surface of the sphenoid bone; the lower border fits into the groove between the ridges on the opposed surfaces of the palatine processes of the upper jaw and palate bones; the anterior joins the vertical plate of the ethmoid above, and the cartilaginous part of the septum of the nose below; the posterior is free, and divides the passage from the nostrils into the pharynx.

Fig. 20.



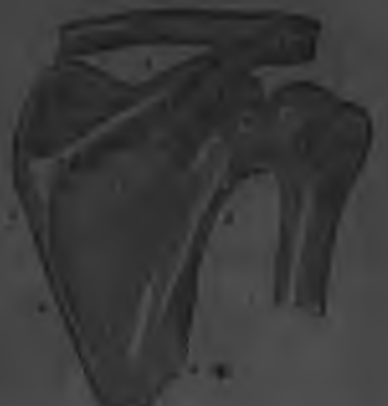
The Inferior Maxillary, or Lower Jaw-Bone (Figs. 1, 2, 3, and Fig. 20) has a form something like that of a horse-shoe. It is made up of a body or horizontal portion (1) and a ramus, or ascending portion (2). The former is convex anteriorly, and on its very front presents the prominence which contributes to form the chin (3). This is marked in the middle line by the Symphysis, at which the two portions of which the jaw was first composed are united. On either side of this is a slight depression, the Fossa incisiva; and further out a hole, the mental (4), through which branches of the inferior dental nerve and vessels pass to the chin. A raised line giving insertion to muscles passes hence obliquely outwards to the upper border; and on the inner surface there is another line corresponding to this and giving origin to the mylo-hyoidean muscle, from whence it is called the mylo-hyoidean ridge. On the inner surface there are also prominences near the symphysis for the insertion of muscles. The lower border is smooth and rounded; the upper, or alveolar process, is marked by sockets corresponding with the number of the lower teeth, which are set in it.

The rami ascend almost vertically from the ends of the two arms of the body. They are broad, flat, and quadrilateral. At the angle (5), where each joins the body, there are on both surfaces rough prominences, the external gives attachment to the masseter, the internal to the internal pterygoid muscle. The internal surface has also, near the end of the mylo-hyoidean ridge, a hole, the inferior dental (6), through which the nerve of the same name passes into the canal of the jaw, from which it again emerges at the mental hole (4). Leading from the dental foramen is a small groove for a branch of the dental nerve. The anterior border of the ramus terminates in a sharp projection, the Coronoid process (7, 7), to which the temporal muscle is attached; the posterior, in a transversely oval process, with a convex summit, the Condyle (8, 8), which articulates with [illegible] of motion to the glenoid cavity of the temporal bone. Below this is the Neck (9), to which the external pterygoid muscle is in part attached; and the space between the condyle and the coronoid process is the Sigmoid notch (10, 10).

The bones of the face serve as a groundwork to many parts whose structures and functions are already described in separate articles, and since, in each case, the parts which the bones take are at the same time considered, an account of their adaptation to the several offices performed by the different portions of the face is not here necessary. Their relations to the muscles are described in the article MAN.

The last main division of the Skeleton consists of the Upper and Lower Extremities (Fig. 1, 2, 3, 4). The upper are composed of the Scapula, Clavicle, Humerus, Radius, Ulna, Carpus, Metacarpus, and Fingers. The scapula and clavicle are analogous to the ossa innominata in the lower extremities.

Fig. 21.



The Scapula, or shoulder-blade, of which, in Fig. 21, the back is represented, with parts of the clavicle and humerus, is triangular in its outline, and flat, being formed of two compact layers and an intermediate diploe varied in thickness. It has three borders or Costæ, a superior (1), posterior (2), which lies nearly parallel with the spine, and an anterior (3), which is also the longest. They are all thicker than the body of the bone, and give insertion to various muscles moving the shoulder. From the posterior border, about one-third from the upper and two-thirds from the lower angle, there commences a ridge called the Spine (4), which as it passes along the back of the scapula towards the outer angle, gradually increases in depth, and at its end, projecting beyond and above the angle, bears a strong arched process, called the Acromion (5), which articulates with the clavicle, overhangs the shoulder joint, and gives attachment to some of its muscles and ligaments. The spine divides the back of the scapula into two parts, of which the lower is much the larger, and which are named, according to their position, Supra (6) and Infra (7) Spinous Fossæ. They give origin to muscles of the same names. The anterior surface, or belly of the scapula, is slightly concave, and gives insertion to the subscapularis muscle, for the attachment of whose several parts it is marked by alternate longitudinal elevations and depressions. At the outer angle the bone is terminated by the Glenoid Cavity (8), an ovate surface slightly hollowed, narrower above than below, and with which the head of the humerus (9) articulates with very extensive freedom of motion. Its border is thick, and is rendered deeper in the recent subject by a rim of fibro-cartilage, the glenoid ligament, similar to that which borders the acetabulum. Between this border and the base of the spine the scapula is narrower than elsewhere; and this part is called the Neck. From the superior costa, near this neck, a long and strong curved process, the Coracoid, projects forwards, and gives attachment to several muscles and ligaments; and at its root there is in the superior costa a hole, or a notch, through which the supra-scapular nerve (and sometimes its accompanying vessels) pass.

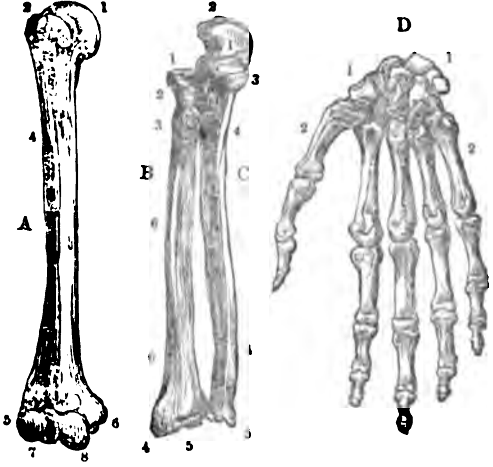
The scapula is attached to the trunk only through the medium of the clavicle, and by the muscles which connect it to the spine and ribs. It can therefore slide freely on the back of the chest; and, to a certain extent, it follows all the larger movements of the humerus, so that its glenoid cavity and the head of that bone, which have but a small surface of mutual contact, almost always preserve the same relation to each other, and are less likely to be dislocated than they would be if the scapula were more closely fixed.

The Clavicle, or Collar-bone, extends transversely from the notch in the upper angle of the sternum to the anterior and outer margin of the acromion (Fig. 21). With both of these its ends are articulated with a moderate extent of mobility; with the sternum, by the apex of a broad triangular surface; with the acromion, by a small flat oval surface on its posterior edge. The Clavicle has nearly the directions of the double-curved line of beauty, being slightly arched forwards at the sternal, and backwards at the scapular, half. At the former it is thick, strong, and triangular; in the latter, broad and flattened. On the upper surface, which lies just under the skin, it is smooth; on the lower it has, near its sternal end, a mark where a ligament fixing it to the first rib is attached; farther out a larger elevation, to which the subclavian muscle is fixed: and near the acromial end, other prominences, to which the ligaments connecting it with the coracoid process of the scapula (which projects just below it) are affixed.

The chief purpose of the Clavicle is to keep the arm at a distance from the trunk for all its outward motions; and in adaptation to this, its length and strength form one of the most characteristic features of the human skeleton.

The Humerus, the bone of the upper arm (*Fig*. 22, A), is articulated above with the scapula by a hemispherical smooth portion called the Head (1), which is bounded at its outer and lower part by a narrow groove called the Neck. The axis of the head forms with that of the shaft or body of the bone an angle of about 130°. Close by the neck, the upper and outer part of the shaft is surmounted by two Tuberosities: the larger and posterior (2) has three flat surfaces, to each of which a muscle from the scapula is attached; the lesser (3) gives attachment to the subscapularis muscle. The rest of the upper part of the shaft is round and nearly smooth; but just above the middle of its outer surface is a rough elevation (4), to which the deltoid, the chief muscle of the shoulder, is attached. About half-way down, the shaft begins to be flatter and wider, and at either border of it commence sharp ridges, which, as they descend, become prominent, and which terminate below at the External (5) and Internal (6) Condyles. Each of the Condyles gives insertion to a ligament and several muscles of the fore-arm; the inner is the more prominent, but the outer is the larger. Between the condyles is the inferior articular surface, which is composed of two parts for articulating separately with each of the bones of the fore-arm. On the outer side, just within the external condyle, the surface has a smooth rounded prominence or tuberosity (7), against which the summit of the head of the radius is apposed; more inwards there is a deep groove (8) separated from the tuberosity by a slight ridge, and from the inner condyle by one much more prominent, in which the raised portion of the sigmoid cavity of the ulna moves as in a hinge-joint. This part of the joint is named the Trochlea. Both before and behind it is bounded above by a depression: into that on the posterior surface, which is the deeper, the olecranon of the ulna is received when the fore-arm is extended; and into the anterior, the coronoid process of the same bone, when the fore-arm is much bent.

Fig. 22.



The Fore-arm contains two bones, the Radius and the Ulna (*Fig*. 22, B, C): the former being that with which the movements of rotation are effected; the latter, that which takes the chief part in flexion and extension. The radius (B), when the palm of the hand is turned forwards, is on the outer side of the arm; and it is the shorter of the two bones. At its upper end it has a circular disk, the Head (1), hollowed on its upper surface, where it articulates with the tuberosity on the lower end of the Humerus (A, 7), and smooth on its circumference, where it is encircled by a ring within which it rotates, and which is formed in part by the ulna, and in part by a ligament. Just below this is the Neck (2), of which the upper part is similarly encircled; and below it, on the anterior and inner surface is a knob, the Tubercle (3), to which the tendon of the biceps, the chief flexor muscle of the fore-arm, is attached. Yet lower, the shaft (6, 6) of the radius becomes three-sided, and as it descends grows wider. At its lowest part it is much expanded, is flattened before and behind, and terminates with a prominent border to which ligaments of the wrist-joint are attached. The posterior and outer surfaces of this lower end are deeply grooved for the passage of tendons: and the latter is prolonged into a blunt-pointed process, the Styloid (4), to which the external lateral ligament is attached. The inner surface has a small smooth cavity, the Semilunar, which articulates with the outer part of the lower head of the Ulna. The terminal surface (at 5) is smooth, somewhat triangular, and slightly hollowed; it articulates with the carpus, and is continuous over the inner border with that which articulates with the ulna.

The Ulna (C) is situated on the inner side of the fore-arm. At its upper and larger extremity it has a broad and deep crescentic notch, the Greater Sigmoid Cavity (1) whose smooth surface is divided into two parts by a middle ridge, and which is received in the trochlea of the Humerus. It is bounded at either end by a sharp process. The upper and posterior is the larger, and is named the Olecranon (2); it forms the rough prominence behind the elbow; and when the arm is extended, its point, which is curved forwards, rests in the fossa at the back of the humerus. The lower and anterior (3) is the Coronoid Process, whose point, when the arm is fully bent, rests in the anterior fossa of the humerus. On the outer side the smooth surface of the great sigmoid cavity is continued over a small oval concave portion of the side of the bone just behind the coronoid process. This is the Lesser sigmoid cavity; upon which the side of the head of the radius rotates, and to whose borders the coronary ligament by which that head is encircled, is attached. The body or shaft (4, 4) of the ulna grows smaller from above downwards, and is for the most part three-sided; its external and sharp margin giving origin to the interosseous ligament, which, being attached also to the opposed margin of the radius, fills up the space between these bones. At its lower end, the ulna becomes nearly cylindrical and then is a little enlarged: at its termination it presents a double articular surface; one, on the end which is nearly circular, and (through the medium of a fibro-cartilage) articulates with part of the carpus; the other, on the outer border, which is narrow and convex, and is received in the semilunar cavity of the radius. The inner border of this lower extremity bears a short and blunt process, the Styloid (5), to which the internal lateral ligament of the wrist-joint is fixed.

The motions of which the Fore-arm is capable are Flexion and Extension, and Rotation on its axis. The two former are effected at the hinge-like joint between the Greater Sigmoid cavity of the Ulna and the Trochlea of the Humerus; the head of the radius moving at the same time forwards and backwards on the lower tuberosity. The elbow affords the best specimen of a hinge-joint in the body, for no lateral motion is permitted in it, the ulna being locked in the groove between the two side-ridges of the trochlea. Rotation, by which also the rotation of the hand is effected, is performed by the upper head of the radius moving round in the ring formed by the coronary ligament and the lesser sigmoid cavity of the ulna; and by its lower head at the same time being carried round on the outer border of the lower head of the ulna. In this movement the ulna is almost fixed, its lower end only being carried outwards as that of the radius is moved far inwards, when in extreme pronation of the hand the two bones are made to cross each other.

The Hand (22, D) consists of the Carpus, Metacarpus, and Fingers. The Carpus (1, 1) is composed of eight small bones arranged in two rows, and so nearly immoveably united by ligaments, that, except in being more elastic, they serve the purpose of a single bony-arch. Those of the first row, which lie nearest to the fore-arm, are (from the outer to the inner side) the Scaphoid, Lunar, Cuneiform, and Pisiform bones: those of the second row, following the same order, are named Trapezium, Trapezoid, Magnum, and Unciform. The three first-named articulate with the radius directly and with the ulna indirectly; the trapezium has a surface of a saddle form, concave from side to side and convex from before backwards, by which the thumb, articulating with it, is permitted to have a very wide extent of motion.

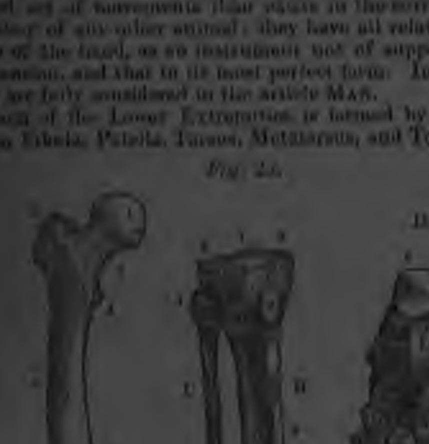
The Metacarpus (between 2 and 21) is composed of five bones, which are called by number according to the order in which they stand; that of the thumb being taken as the first. Each is described as consisting of a body and an upper and lower heads. The form of the upper head is adapted to one or more of the bones of the carpus; that of the lower is in all very convex, and rather narrow. The body is compressed from side to side, and is broader behind than before, and on its dorsal than on its palmar aspect. The first metacarpal bone only has free mobility.

The Bones of the Fingers are called Phalanges. The thumb has two, each of the fingers three. Their form and proportionate sizes are plainly exhibited in *figure* 22, D. They are articulated with each other, and with the metacarpal bones, so as to permit free extension and flexion, and at the joints between the phalanges and metacarpal bones is also permitted a certain extent of lateral motion. As at that between the carpus and fore-arm there is a very extensive hinge-like motion of flexion and extension, as well as a wide lateral motion.

The general arrangement of the bones of the human upper extremity is adapted to a far more extensive and varied set of movements than exists in the corresponding member of any other animal; they have all relation to the office of the hand, as an instrument not of support, but of prehension, and that in its most perfect form. In this view they are fully considered in the article MAN.

Each of the Lower Extremities is formed by a Femur, Tibia, Fibula, Patella, Tarsus, Metatarsus, and Toes.

Fig. 22.



The Femur, or Thigh-bone, A, is the largest of the Body. It articulates with the acetabulum of the Os innominatum by its head (1), which forms rather more than half a sphere, and is smooth, except at its summit, where there is a depression for an interarticular ligament. It rests upon a narrower part, the Neck (2), which descends obliquely to the summit of the shaft, and is at its base somewhat expanded. It is received between two strong processes called Trochanters, by which the shaft is surmounted, and its base is bordered by two oblique lines, named Intertrochanteric, which pass on either surface of the bone, from one to the other Trochanter. The Greater Trochanter (3) is the uppermost and lies at the outer part of the bone; it is thick, rough, and strong, and gives attachment to the great muscles of the buttock. Behind it is a deep depression, the Digital Fossa, in which the obturator and other muscles to rotate the thigh outwards are attached. The Lesser Trochanter (4) is on the inner aspect of the femur, and also gives a point of insertion for muscles. At the level of the Trochanters the shaft is flattened both behind and before; but below them it is round and nearly cylindrical, (4), within one-fourth of its length from the lower end, it expands, and again becomes flattened. The shaft (5, 5) of each femur is directed rather inwards, and is slightly arched forwards; its axis makes, with that of the neck and head, an angle of about 120°. Its surface is everywhere smooth, except behind, where there is a prominent line, the Linea aspera, running along the middle, and at either end dividing into two, which above go each to one of the trochanters, and below each to one of the condyles. These condyles are the processes in which the lower expanded part of the femur terminates. The inner condyle (6) is the narrower, and descends lower than the outer (7), which is the broader and stronger. Their articular surfaces are united in front at a concave pulley-like surface (8), over which the patella lies; below it they diverge, and at the back of the femur are separated widely as two very convex prominences, between which there is a deep and rough fossa, in which the Crucial ligaments of the knee joint are fixed. On the sides of the femur, just above the lower border of the condyles, are eminences, the Tuberosities (9, 9), to which the external and internal lateral ligaments respectively are attached.

The Tibia, or Shin-bone (*Fig.* 22, B), is placed at the front and inner part of the Leg. Its upper part or Head (1) is far larger than any other. Its upper surface is nearly oval, its greatest diameter being transverse; and it presents two slightly concave oval smooth surfaces (2, 2), on which the condyles of the femur rest. Between them is an eminence, named the Spine, which fits in between the condyles, and to which, as well as to rough surfaces before and behind it, the crucial ligaments and semilunar cartilages are fixed. Below and on the sides of the head are Tuberosities on which the lateral ligaments are inserted, and behind the external tuberosity is a smooth surface which articulates with the head of the fibula. In front, and a little below them, is the Tubercle (4), to which the ligamentum patellæ is attached. Below this the body (5, 5) is triangular, and as it descends, becomes smaller: its outer surface is hollowed; its inner, which forms the shin, slightly convex; its posterior rounded. The outer border gives attachment to an interosseous ligament, which fills up the space between it and the opposed part of the fibula; the anterior is sharp and prominent, and is named the Crest. The lower or tarsal extremity is a little expanded, and has a somewhat quadrilateral form. Its outer aspect has a slightly concave surface, which is articulated immoveably with the fibula; the inner is prolonged into a bluntly pointed process, the internal malleolus (6), which has the internal lateral ligament of the ankle fixed to its extremity, and a smooth surface on its outer side, which articulates with the astragalus. The anterior surface of this extremity is smooth where tendons pass over it; the posterior is flat; the lower or terminal surface (7) is quadrilateral and slightly hollowed; it rests on and is articulated with the astragalus.

The Fibula (*Fig.* 22, B) is situated at the outer part of the leg, and is fixed immoveably by the side of the Tibia. It is long, very slender, for the most part three-sided, and enlarged at either extremity. The upper extremity or head (1) is the smaller; it is rounded, and on its upper and inner part has an oval smooth surface, with which it articulates with the outer tubercle of the Tibia; the rest of its surface is uneven, for the attachment of ligaments and a tendon. The lower extremity (2) is longer and more pointed than the upper; it forms the external malleolus, or outer ancle, to whose extremity the external lateral ligament of the joint is attached, and whose inner surface is articulated with the astragalus; behind it is a deep groove, over which the tendons of some muscles of the leg pass to the sole of the foot. Above the malleolus, and on the inner aspect of the fibula, is a smooth surface, where it is united with the tibia.

The Patella, or Knee-pan, has a somewhat triangular outline. Its narrowest part is below, and is fixed by the ligamentum patellæ to the tubercle of the tibia. Its anterior surface is slightly convex, and looks fibrous, being marked by the insertions of the tendons of the extensor muscles of the leg; the posterior is smooth, and divided by a ridge into two parts, of which the outer is the larger, and which are adapted to the pulley-like surface between the condyles of the femur.

The Tarsus is composed of seven bones, namely, the Astragalus (1), Os Calcis (2), Navicular (3), Cuboid (4), Internal (5), Middle (6), and External (7) Cuneiform Bones. These are set together so that they cannot be moved by any slight force, and yet are possessed of considerable elasticity. The Astragalus is that on which, through the Tibia, which rests upon its upper quadrilateral surface, the weight of the body first falls. With the Tibia above, and the two malleoli on either side of it, it forms the ancle-joint, a hinge with a limited lateral motion. Its lower part rests, with two surfaces of contact, on the os calcis, whose hinder prominent part (8) forms the heel; and its anterior portion or head is received in a cavity, formed by the navicular bone in front, part of the os calcis behind, and a very strong ligament below and between them. This cavity is at the summit of an arch which the tarsus and metatarsus together contribute to form, and of which the supports are the os calcis behind and the ends of the metatarsal bones before. It is indeed a double arch, for it has at the sole a concavity, both from before backwards and from side to side; and the strength with which its several parts are joined is so great, that few accidents are rarer than a fracture or dislocation of any of the bones of the tarsus.

The rest of the bones of the Foot, including those of the Metatarsus (9, 9) and the Toes, are in number, arrangement and form very similar to the Metacarpus and the Phalanges of the Fingers. The metatarsal bones however are longer, more slender, and set more closely side by side than the metacarpal; and the Phalanges are all much shorter, and (except the two of the great Toe) smaller. Their movements are in general the same as those of the fingers, but less extensive; neither is there any adaptation for so free a movement of the first toe as of the thumb.

For the remainder of the mechanism of the bones of the leg the article **Man** may be again referred to.

There are some supplemental bones of the skeleton, which need but just be mentioned. These are the Sesamoid and the Hyoid bones. The former occur within the substance or in the course of tendons which are much exerted; the patella is the largest of them; the number and existence of the others are not certain, but there are almost always two at the first joints of each of the thumbs and great toes; they are small, oval, or round, and rough on all their surfaces, except that by which they articulate with the bone on which they lie. The Hyoid bone is that on which the larynx is suspended, and the base of the tongue fixed; it is not articulated, except by long ligaments, with any other of the bones, and is described in the articles **Larynx** and **Tongue**. In relation to many points in this article, those on **Articulations** and **Bone** may be consulted, as well as those to which distinct references are given.

SKELLEFTEA-ELF. [Bothnia.]

SKELTON, JOHN, an English poet of an antient Cumberland family, was born some time in the latter part of the fifteenth century. Very few particulars of his life are known. The first mention of him is in the preface to Caxton's translation of the '*Æneid*,' printed in 1490, where he is said to have been lately created poet-laureate in the 'Unyversite of Oxenforde.' This honour was a degree in grammar conferred by universities, and not, as is now the case, an office in the gift of the crown. (Warton, *Hist. Eng. Poetry*, in the account of Skelton; and Malone, *Life of Dryden*, i. 83.) Skelton was ordained deacon in 1498, by the bishop of London, and priest the following year. (*Regis*$^{\text{m}}$ *Savage. Epis*$^{\text{i}}$ *London.*, quoted by Bishop Kennet in his collections; Lansdowne MSS.) He was afterwards admitted to an ad eundem degree at Cambridge and allowed to wear the dress (*habitus*) given him by the king. This we must suppose to have been some badge of royal favour bestowed on him by Henry VII., to whose son Henry VIII. he was tutor, being esteemed so great a classical scholar as to obtain from Erasmus the praise of being 'Britannicarum Literarum Decus et Lumen.' (*Epistle to Henry VIII.*, prefixed to his *Epigrams*, 294, 4to., Basil., 1518.) In 1507 we find from his own statement in his poems that he was rector of Diss in Norfolk and curate of Trompington in Cambridgeshire.

In the reign of Henry VIII., if not during the lifetime of his predecessor, he was appointed orator regius, as he styles himself in the title to several of his poems, being, according to Warton, a graduated rhetorician employed in the service of the king, though whether with any salary does not appear; in one place he is called Regiæ Orator ('Poems'), in a passage referring probably to the battle of Guinegate, 1513.

Skelton became notorious from his coarse and bold invective against Cardinal Wolsey and the clergy in general, but according to tradition his own conduct as a priest was far from being creditable. He was esteemed, observes Wood (*Athenæ Oxon.*), in his parish and the diocese more fit for the stage than the pew or pulpit; he is said to have been suspended by the bishop of Norwich, having been guilty of 'certain crimes, as most poets are.' (Wood, *Ibid.*) The crimes alluded to in this passage were probably something more than the mere extravagances of buffoonery; he is accused by Fuller of having kept a concubine, or a wife (according to Delafield, 'Anecdotes of celebrated Jesters,' &c., MS. Bodl., quoted by Bliss, *Ath. Oxon.*), a graver offence at that time. The severe attack upon Wolsey in the poem, 'Why come ye not to Court?' drew down upon him the resentment of that great ecclesiastic, who ordered him to be arrested. Skelton took sanctuary at Westminster, under the protection of Abbot Islip, to whom, in 1512, he dedicated the 'Præconium Henrici Septimi.'

He died in this retreat, June 21, 1529, and was interred in the churchyard, with the inscription, 'J. Skeltonus Vates Pierius hic situs est. Animam egit 21 Junii, An. Dom. MDXXIX.'

Skelton was much thought of in his day. We have already quoted the praise bestowed on him, and 'of the like opinion,' says Wood, 'were many of his time. Yet the generality saw that his witty discourses were biting, his laughter opprobrious and scornful, and his jokes commonly sharp and reflecting.' Among the nobility his patron was Algernon Percy, fifth earl of Northumberland, and he has written a long elegy on the death of that nobleman's father.

The chief of his poems are the 'Crowne of Lawrell' and the 'Bouge of Courte,' two cold and tedious allegories; 'Why come ye not to Court?' a satire against Wolsey, and the 'Boke of Colin Clout,' 'Ware the Hawk,' &c., attacks upon the whole body of the church. In other poems Henry VIII.'s foreign enemies, particularly the Scotch, are the victims of his scurrility, or else some private grudge is gratified, as in his abuse of William Lilye the grammarian. Most of his productions are enumerated in Wood's 'Athenæ' (Bliss), who says he wrote '50 several things.' According to Caxton, in the passage quoted above, he translated the Epistles of Cicero, Diodorus Siculus, and various Latin writers.

Skelton has been called original and inventive. He is rather unique; in style there is no known writer throughout our literature to whom he can be compared. His poems, if they deserve the name, present a strange mixture of ribaldry, learning, malice, and buffoonery, unrelieved by any traces of the higher qualities of satire. The structure of his verse is irregular and tuneless; the language, a motley jargon, at once pedantic and barbarous; in the 'Boke of Philip Sparow,' he complains of the rude and unpolished state of his native tongue, to the improvement of which his studied obscurity has certainly not contributed. His Latin compositions are written with comparative elegance.

He appears to have been one of the earliest authors in this country who addressed themselves to the nation at large, rather than to the nobility or to any particular class. Hence perhaps the grotesque combination in his works of classical allusions and phraseology, and of doggrel for the unlettered multitude. That he should have been admired in an imperfectly civilized age and in the dearth of better literature is not surprising, when we consider that in a crisis of great political excitement, such as the Reformation, any metrical compositions are eagerly circulated which embody, however rudely, the feelings and opinions generally prevalent among the people.

In this point of view, regarding them as eminently typical of the bold and unlicensed spirit of his time, we may still be interested by the poems of Skelton. They present moreover a curiously minute picture of the corruptions of the Romish church, to the infamy and downfall of which they probably much contributed, and contain several allusions to passing events which are not without historical value. In the 'British Bibliographer' (iv. 389) there is a full length portrait of Skelton in the dress of his time, copied from the wood-cut in a work of Skelton's in the British Museum entitled 'A Ryght Delectable Tratyse upon a goodly Garlande or Chapelet of Laurell, by Mayster Skelton, Poete laureat, studyously devysed at Sheryfhotton Castell, &c. Inprynted by me Rycharde faukes,' &c., 1523, 4to. A new edition of the Works of Skelton, with an introductory Life by the Reverend A. Dyce, is announced for publication.

SKEW BACK, in civil engineering, the course of masonry forming the abutment for the voussoirs of a segmental arch, or, in iron bridges, for the ribs. In the latter case a plate of cast-iron is usually laid upon the stone skew-backs, extending the whole width of the bridge, and forming a cap to the masonry. On account of the expansion and contraction of iron under changes of temperature, the ribs should not, especially in large arches, be fixed to their abutments. The ribs of Southwark Bridge, over the Thames, were originally bolted to the masonry of the piers; but it was found necessary, on this account, to detach them during the progress of the works.

SKEW-BRIDGE, a bridge in which the passages over and under the arch intersect each other obliquely. In constructing a road or railway through a district in which there are many natural or artificial watercourses, or in making a canal through a country in which roads are frequent, such intersections very often occur. As however the construction of an oblique or skew arch is more difficult than that of one built at right angles, skew bridges were seldom erected before the general introduction of railways; it being more usual to build the bridge at right angles, and to divert the course of the road or of the stream to accommodate it, as represented in *Fig.* 1, in which *a b* is a stream crossed by the road, the general direction of which is indicated by the dotted line *c d*. In a railway, and sometimes in a turnpike road or a canal, such a deviation from the straight line of direction is inadmissible, and it therefore becomes necessary to build the bridge obliquely, as represented in the plan, *Fig.* 2. Where space and expense do not require to be considered, an oblique arch may be avoided, either by building the bridge square with the upper passage, and making the span so wide as to allow the stream to pass under it without being diverted; or by building the arch square with the stream, and of sufficient length to allow the upper passage to take an oblique course over it; but either of these is a clumsy expedient, although well adapted for some situations. The arches or tunnels by which the Birmingham railway is conducted under the Hampstead-road and Park-street, near the London terminus, are instances of the latter kind of construction; the length of the arches being such that they present faces square with the line of railway, notwithstanding the oblique direction of the roads over them. A similar case occurs at Denbigh Hall, on the same line, where the railway crosses over the London and Holyhead road at such an angle that the difference of direction is only 24°. In this case a long gallery is constructed under the railway, consisting of iron ribs or girders, resting upon walls built parallel with the turnpike road; the ribs, and consequently the faces of the bridge, being at right angles with it. This gallery is about two hundred feet long and thirty-four feet wide; and by its adoption, the necessity of building an oblique arch of eighty feet span was avoided. The necessity of increasing the span of an arch according to the degree of obliquity, by which the expense and difficulty are materially increased, is illustrated by *Fig.* 3, the ground plan of an oblique arch across a stream *a b*. Here it is evident that *e g* is the actual span of the arch; although *e f*, the breadth of the stream, would be the span of a straight arch, having the same width of passage underneath.

Fig. 1.

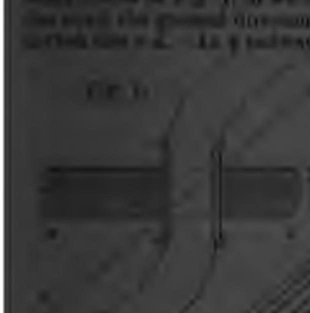


Fig. 2.

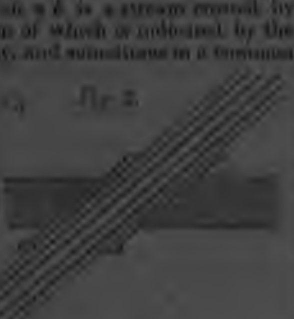

Fig. 3.

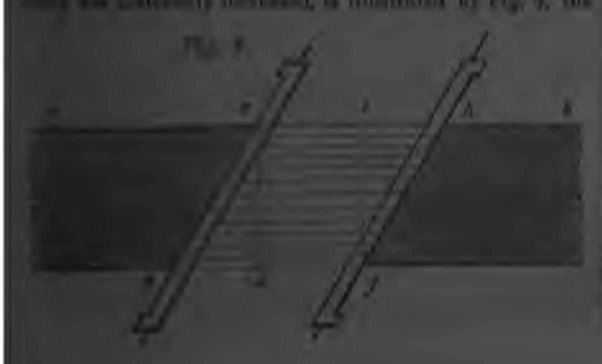
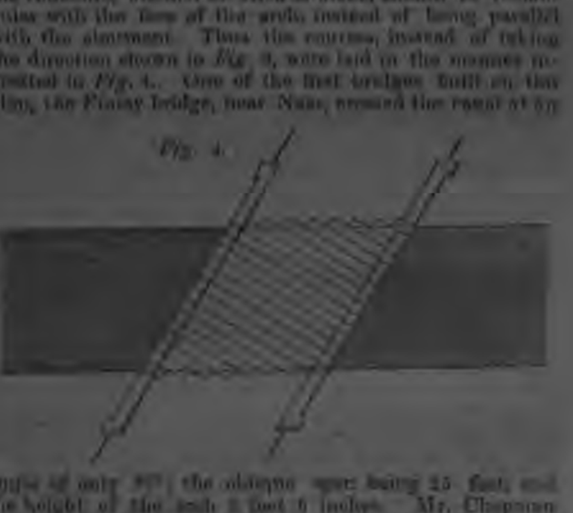


Very little is known respecting the origin of skew bridges. It has been repeatedly asserted that those built by George Stephenson on the Liverpool and Manchester railway were the first erections of the kind; but this is certainly incorrect, there being several earlier instances in Lancashire. A paper in the 'Transactions of the Institution of Civil Engineers,' vol. i., p. 183, alludes to an oblique arch erected about the year 1530 by *Ammanati*, called 'Il [illegible],' over the river Mugnone near *Porta Sangallo*, at *Florence*. It appears however that the principle upon which such bridges should be constructed was too little understood to render an attempt at constructing them on a large scale advisable. The best information the writer has met with on the subject is contained in the article 'Oblique Arches,' in Rees's 'Cyclopædia,' an article which appears to have escaped the notice of modern writers on this branch of engineering science. It is written by an engineer named Chapman, who mentions oblique bridges as being in use prior to 1787, when he introduced a great improvement in their construction. Down to that time, as far as he was informed, such bridges had always been built in the same way as common square arches, the voussoirs being laid in courses parallel with the abutments. How very defective such an arch would be may be seen by reference to *Fig.* 3, in which lines are drawn to indicate the direction of the courses. It is evident that here the portion *c d f e* is the only part of the arch supported by the abutments; the triangular portions *c d g* and *e f h* being sustained merely by the mortar, aided by being bonded with the rest of the masonry. This plan would therefore only be adopted for bridges of very slight obliquity, and even then with considerable risk. About the time mentioned above, Mr. Chapman was employed as engineer to the Kildare canal, a branch from the Grand Canal of Ireland to the town of Naas, on which it was desired to avoid diverting certain roads which had to be crossed. He was therefore led to think for some method of constructing oblique arches upon a sound principle, of which he considered that the leading feature must be that the joints of the voussoirs, whether of brick or stone, should be rectangular with the face of the arch, instead of being parallel with the abutment. Thus the courses, instead of taking the direction shown in *Fig.* 3, were laid in the manner indicated in *Fig.* 4. One of the first bridges built on this plan, the Finlay bridge, near Naas, crossed the canal at an angle of only 27°; the oblique span being 25 feet, and the height of the arch 5 feet 6 inches. Mr. Chapman observes that the lines on which the beds of the voussoirs lie are obviously spiral lines, and to this circumstance may be attributed much of the singular appearance of oblique arches. The Finlay bridge stood well, but the ingenious designer did not think it prudent in any other case to attempt so great a degree of obliquity, although he built several other bridges on the same principle, over the Grand Canal in Ireland, and over some wide drains in the East Riding of Yorkshire. He recommends carrying up the masonry as equally as possible from each abutment, in order to avoid unequal strains on the centering.

Fig. 4.



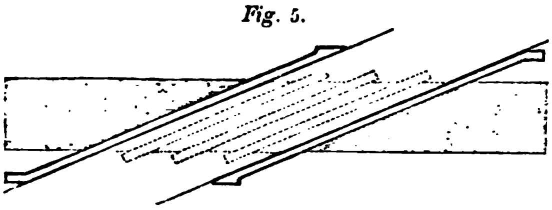
On the Liverpool and Manchester railway, out of rather more than sixty bridges, about one-fourth were built on the skew; one, built of stone, conducting the turnpike-road across the line at Rainhill, being at an angle of only 34°, by which the width of span is increased from 30 feet, the width of the railway from wall to wall, to 54 feet, the width on the oblique face of the arch. Skew-bridges have since become very common, and some have been erected of even greater obliquity. That at Box-moor, on the Birmingham railway, is stated, in Roscoe and Lecount's history of the undertaking, to be unrivalled for obliquity by any other brick arch. Its angle is 32°, the square span 21 feet, and the oblique span 39 feet. There are also brick arches of great obliquity on the Greenwich and Blackwall railways, but with their precise angles we are unacquainted.

The extended use of such structures has led to the promulgation of several methods for forming the voussoirs with accuracy, and disposing them in the most advantageous manner. The common theory, the credit of which is claimed, we believe, both by Mr. Nicholson and Mr. Fox, is that the courses of the stones should form portions of the thread of a square-threaded screw, or rather, of a thread somewhat of the dovetail form; the highest point of each thread, or that in the crown of the arch, being at right angles to the direction of the road. This theory, it is contended by the author of the article 'Skew-Bridge,' in the recent edition of the *Encyclopædia Britannica*, is imperfect; and he intimates that, in the present state of this branch of science, the most perfect way of constructing a skew-arch would be to cut the stones as they are wanted, forming each of them in such a manner 'that two of its opposite sides, or at least the middle parts of these sides, should be as nearly as possible at right angles both to the soffit and also to the direction of the passage over the bridge.' Those who wish for further information on this subject are referred to Nicholson's paper on the *Principles of Oblique Bridges*, presented to the British Association in 1838; the treatises of Messrs. Fox, Hart, and Buck on oblique bridges; and the article just quoted.

From Mr. Buck's treatise it appears that the difficulty of building skew-bridges increases with the obliquity of the angle from 90° to 45°, which is supposed to be the most hazardous angle for a semicircular arch; but that beyond that point, instead of increasing, it rather diminishes, to about 25°, which appears to be about the natural limit for a semi-cylindrical arch. Mr. Buck, whose experience renders his opinion highly valuable, considers that oblique arches of the elliptical form should not be attempted, as they are deficient in stability, more difficult to execute, and more expensive than semicircular or segmental arches.

The construction of skew-bridges of iron or timber is comparatively simple, the ribs or girders of which such bridges are composed being of the usual construction, laid parallel with each other, but the end of each being in advance of that next preceding it. *Fig.* 5 represents the ground-plan of such a bridge, the dotted lines indicating the situation of the ribs upon which the platform is supported.

Fig. 5.



The extraordinary iron bridge by which the Manchester and Birmingham railway is conducted over Fairfield-street, Manchester, at an angle of only 24½°, is a fine example of this kind of skew-bridge. It consists of six ribs, of rather more than 128 feet span, although the width of the street is only 48 feet, resting upon very massive abutments of masonry. The total weight of iron in this bridge, which is considered to be one of the finest iron arches ever built, is 540 tons. It was erected from the design of Mr. Buck, who has constructed several other oblique bridges of great size and very acute angles. Timber bridges, formed of trussed ribs or girders, are built on the same principle. One of very great obliquity, on the Sechill railway, is represented in the second series of Brees's *Railway Practice*. A somewhat similar mode of constructing skew-bridges in brickwork has been introduced by Mr. Gibbs on the Croydon railway. The Jolly Sailor bridge, which crosses over this line near Norwood, consists of four separate ribs of brickwork, each forming an elliptical arch of 50 feet span, with a versed sine of 12 feet 6 inches, supporting a flat viaduct of Yorkshire flagstones. Each of these ribs, which are three feet wide on the transverse face, is built square, so that the brickwork is of the simplest kind; but by making the respective abutments project beyond each other according to the oblique direction of the railway, the ribs, taken collectively, form a skew-arch. In a bridge erected by Mr. Woodhouse on the line of the Midland Counties railway, the same principle is adopted, but the ribs are placed close together, so that no platform of flagstones is required.

SKIDDAW. [CUMBERLAND]

SKIMMER. [RYNCHOPS.]

SKIN. The skin, or derma, is the outer covering of the body; and having to serve at once as a defence for the more deeply seated structures, as an organ of touch, and as an apparatus for secretion, it is one of the most compound of all the tissues.

It is composed of two chief parts:—a vascular basis named Cutis, and a superficial layer named Epidermis or Cuticle, which is not vascular. The cutis is made up for the most part of fibres and laminæ, like those of common cellular tissue. They are much more densely woven near the surface than in the deeper part of the skin: in the former they constitute a very tough and elastic compact membrane; in the latter they are arranged in irregular large cells, which in moderately stout persons are filled with fat, but in the emaciated are collapsed, and form a loose flocculent white tissue. This general form of structure prevails through the whole skin; but in different parts of the body, and still more in different persons, the density and thickness of its layers, the size of the cells, the quantity of fat which they contain in the deeper parts, and the fineness or coarseness of the tissue composing them, vary considerably.

The external surface of the skin presents a variety of wrinkles. The larger of these are produced by the action of muscles, which in many parts throw the skin into folds, others result from its loss of elasticity in old age, and the removal of the fat beneath it; and again others, which are seen most plainly on the palms and the balls of the fingers, and on the corresponding parts of the foot, run in very close parallel arches, and indicate the arrangement of subjacent rows of sensitive papillæ, with which the whole surface of the skin is beset, and which in the parts just named, and in some others, are arranged in regular double lines In their most developed state, on the balls of the fingers for example, the papillæ are very fine conical processes, standing somewhat obliquely, and so densely set, that their summits form a seemingly smooth surface. On these parts each elevated line which one sees on the surface has beneath it two rows of papillæ; for when looked at closely, each such ridge shows on its summit a little furrow dotted with minute apertures, and which fits into the space between the rows of papillæ. Over the rest of the body the papillæ are much smaller, and are irregularly arranged. Everywhere however they are the most vascular part of the skin, each papilla receiving a distinct loop from the subjacent network of blood-vessels. It is in them also that the greater part of the very numerous nerves of the skin terminate; for though every part of the skin be sensitive, yet the papillæ are so in the highest degree, and are the chief instruments by which the sense of touch is exercised. [SENSES; NERVE.] It is through their being so much developed, that the tips of the fingers are adapted for the perception of the finest impressions of the sense; though even they have less delicate perception than the tip of the tongue, on which similar but larger and more pointed papillæ are set.

The chief secretory apparatus of the skin consists of the perspiratory glands, which are disposed over its whole extent, but, like the papillæ, are largest and most numerous in the palms and soles. By looking on the surface of the cuticle covering these parts, one may see, especially on a warm day, or when perspiring freely, a number of minute orifices between and upon the tops of the arched ridges already described. These are the orifices of the glands by which the perspiration is secreted, and sometimes one may squeeze through them a drop of the clear crystal fluid which the glands produce. Each orifice leads to a fine tube of somewhat less diameter than itself, which passes down through the epidermis, and into the deeper parts of the skin, making on its way several spiral turns, and ending in a slightly enlarged closed sac. In the sole each such tube makes from 15 to 20 spiral turns; in the palm, from 6 to 10½ in other parts. Hence: in the right hand the spiral turns are made from left to right; in the left from right to left. There are about [illegible] of these orifices in a square line of the surface of the tip of the fore-fingers; and about 73 in the same space between the bases of the fingers: taking therefore the whole superficies of the body at 14 square feet, it is probable that, as Eichhorn calculated, there are not less than ten millions of these glands scattered through the skin.

It is in these that the perspiration is being constantly formed, though it most generally passes away as fast as it is produced in an invisible vapour, and during health collects in the form of sweat only when it is very rapidly formed, as during active exercise, or when the surrounding atmosphere is already saturated with moisture. The fluid of the perspiration is composed of water, with very small quantities of animal and saline matters, some free lactic acid, nitrogen, and carbonic acid. By thus removing carbonic acid from the blood, the skin is, next to the lungs, the most important and constant excretory organ of the body; some recent experiments have proved that animals prevented from perspiring die of suffocation as certainly, though not so rapidly, as when lung respiration is obstructed. The quantity of perspiration secreted amounts to about two pounds in 24 hours, but it is liable to considerable variations, according to the habits of the individual, the state of the atmosphere, the activity of other glands, such as the lungs and kidneys, and other circumstances.

Another secretion from the skin is that of the oily sebaceous matter by which its surface is always kept in a slight degree greasy, so that water adheres to it only in drops, and does not easily soak into the substance of the epidermis. The sebaceous glands by which this secretion is produced, as well as the hair-follicles on which they are almost always attendant, are already described. [HAIR.]

The loss of fluid by these secretions from the skin is in some measure compensated by the absorption which it also exercises. It is uncertain how much, if any, of the vapour of the atmosphere around us is thus imbibed; but it is certain that the skin absorbs fluids placed for a short time in contact with it, and this so rapidly, that (especially after long fasting) a perceptible increase of weight is observed when a person has been immersed in a bath. The obstacle to a more constant and considerable absorption of fluid is the nearly impermeable layer of epidermis; and hence the substances most rapidly absorbed are those which most easily pass through it, such as water, after having been imbibed into its deepest layers, vapours of sulphuretted hydrogen, hydrocyanic acid, &c., oils rubbed upon it, or corrosives which destroy its texture.

Besides its secretions, there are produced from the vessels of the skin materials of which are formed certain appendages for its protection and other purposes, such as the cuticle, the hair, and the nails.

The cuticle, or epidermis, is an insensible and non-vascular membrane, which is laid over the whole of the external surface of the body in a layer, the thickness of which is varied according to the protection required for the well-being of the subjacent cutis. The under surface, which is next to the cutis, is accurately fitted into all its irregularities, and sends prolongations down into the interior of all its glands and follicles; the outer surface, which is exposed to friction, is comparatively smooth. The epidermis is composed of several layers of cells: of the two layers into which it may commonly in an ordinary dissection be split, the lower is called rete mucosum, or rete Malpighii; the upper and outer, more particularly, epidermis. In the deeper layers the epidermis is composed entirely of minute polygonal cells adhering by their edges, and containing nuclei and a clear fluid; in the layers nearer the surface are cells of the same kind, but larger and flatter; and those on the very outer surface are dry and scale-like; they have lost almost all trace of form, and becoming loose, are removed by friction at exactly the same rate as, under ordinary circumstances, new cells are produced at the surface next the cutis. Thus the epidermis is subject to constant and rapid change: its cells, as fast as they dry and are removed in the form of scurf [SCURF] from its exterior, being replaced by new ones at its interior; and thus, whatever waste (within certain limits) it is subject to, its thickness is not diminished, but rather, as the waste is increased, so is its thickness, till it attains that degree which is competent to the protection of the subjacent cutis; as any one may see in the palms of his hands, soon after he has begun to occupy himself in a more than usually laborious handicraft.

The epidermis is the seat of the characteristic national colours of the skin, as well as of the colours of freckles and other superficial marks. In dark-complexioned races, especially in negroes, it is very thick, and its cells are filled with minute black or otherwise coloured pigment-granules, many of which also lie loose among them. The thickness of the epidermis in these tribes renders it less penetrable by the rays of heat; and it is hence (and not on account of its colour, which would have an opposite effect) that a negro can bear the exposure of his skin to a degree of solar heat which blisters that of a European.

The hairs are already described in a separate article. The nails are thin laminæ of horny tissue, produced by the cutis on the back of the ends of the fingers and toes. Under each of the more perfect of the nails, such as those of the fingers and the great toe, the cutis has a peculiar structure, called the matrix of the nail, composed of large sharply pointed and very vascular papillæ, which at the root are arranged irregularly, but at the body of the nail are placed in close-set rows or longitudinal ridges. By all this vascular surface the substance of the nail is produced in minute cells, which subsequently coalesce and form the dense, obscurely fibrous, and transparent mass of the body of the nail. The crescentic opaque part at the root of the nail owes its whiteness in part to its own substance, which in the deeper layers is softer and more opaque than in those of the body, and in part to the surface beneath it being less vascular than the rest.

The under surface of the nail is grooved or otherwise marked in correspondence with the matrix, to which it closely fits; the outer surface, exposed to friction, is comparatively smooth, though still it presents traces of the ridges in which, when it was at the under surface, it was formed; for the nails are produced in the same method as the cuticle; as fast as their exposed surfaces or their ends are worn away, they are replaced by layers growing from the matrix; and the whole mass of the nail, growing at once from below its body and from its root, is constantly pushed forwards and thickened, at the very same rate as its free extremity is cut or worn down, and its body thinned by friction.

SKINNER, STEPHEN, M.D., born 1623, died 1667, a skilful physician and a very learned philologist. He was born in London or the neighbourhood; studied in the University of Oxford, where he was a commoner of Christ Church; but the civil war coming on, he left Oxford without taking a degree, and travelled abroad, occasionally remaining some time at the foreign universities. In 1646 he returned to Oxford, and took the usual academical degrees; after which he again went abroad, living in France, Italy, Germany, and the Netherlands; frequenting the courts of princes and the halls of the universities, being highly esteemed both for his learning and his general deportment. He took the degree of M.D. at Heidelberg, and afterwards at Oxford, in 1656. He then settled at Lincoln, where he engaged in the practice of medicine with great success; but his career was short. In the beginning of autumn in 1667 febrile complaints were very prevalent in Lincolnshire, and he, among others, was fatally attacked. He died on the 5th of September in that year, at the age of forty-four, to the great regret of his friends, to whom the innocence of his life and the cheerfulness of his disposition had endeared him.

His early decease was a great loss also to the world, for he was applying his vast stores of philological knowledge to the illustration of his native language, and had made no inconsiderable progress in a work which was designed to serve as an etymological dictionary of the language. This manuscript came after his death into the hands of Thomas Henshaw, Esq., of Kensington, who had a disposition to the same kind of studies, and who made additions to it. He also superintended the publication of it, which was effected in 1671, in a folio volume, under the title of 'Etymologicon Linguæ Anglicanæ.' Dr. Skinner's work has the great disadvantage of having been left unfinished by the author, who, it may be presumed, would have struck out, as well as added, as his knowledge advanced and the general principles of philology became more distinctly perceived by him, which would probably have been the case had he proceeded in his work. As it is, it is to be regarded rather as containing anecdotes of the language than as a systematic body of English etymologies; but it contains numerous valuable suggestions, and many later English etymologists have made use of his labours. The etymological part of Dr. Johnson's Dictionary is almost wholly derived from Skinner and Junius.

SKIPTON. [YORKSHIRE.]

SKIRRET. [SIUM.]

SKODRE'. [SCUTARI.]

SKORODITE. *Cupreous Arseniate of Iron.* Occurs crystallized and massive. Primary form a right rhombic prism. Cleavage parallel to the primary planes, indistinct. Fracture uneven. Hardness, scratches carbonate of lime, and is scratched by fluor-spar. Rather brittle. Colour bluish-green of different degrees of intensity, also blackish-green, brown, and black. Streak white. Lustre vitreous. Transparent; translucent; opaque. Specific gravity 3·162 to 3·2.

Massive varieties, globular, fibrous, radiating.

By the blow-pipe gives arsenical vapours, and fuses into a globule attracted by the magnet. Found in Cornwall, Saxony, near Huttenburg in Carinthia, Brazil, &c.

Analysis by—

Chenevix.	
Arsenic Acid	33·5
Oxide of Iron	27·5
Oxide of Copper	22·5
Water	12
Silex (matrix)	3
	98·5

Ficinus.	
Arsenious Acid	31·40
Protoxide of Iron	36·35
Protoxide of Manganese	4·00
Sulphuric Acid	1·54
Lime	2·00
Magnesia	2·00
Water	18·00
Gangue	1·40
	96·59

It would appear that different substances have in this, as in other cases, been called by the same name. In one analysis we have arsenic and in the other arsenious acid; one contains no oxide of copper, and the other no oxide of manganese. A specimen examined by R. Phillips contained no copper.

SKOVORODÂ (known in the Ukraine under the name of Gregory Sawicz, or Gregory the son of Sava) was born about 1730, of poor parents, in a village near Kiew, where his father was subdeacon or parish clerk. He was admitted at the age of twelve years into the ecclesiastical academy of Kiew, in the capacity of a servant, but was soon allowed to attend the lectures there, in consideration of the talent which he showed. After obtaining the reputation of being the best classical scholar of the place, and in vain soliciting permission to go abroad, he set out on foot, without the knowledge of his superiors, for Pesth, where he commenced the study of the German language, and in six months was able to profit by the lectures. His account of these lectures however shows them to have been very inefficient, and moreover the fame of Wolf was then at its height and attracting students from every part of Germany to Halle. Skovorodâ went to Halle, where he devoted three years to metaphysical and theological studies; and that his country might profit by the advantages which he derived from foreign learning, he made at this time translations from the Homilies of St. Chrysostom, and composed moral fables which have been handed down orally by the inhabitants of the Ukraine, the surest possible test of their popularity. After four years he returned to Kiew, but was not re-admitted into the academy, nor appointed to any post in which his energies might find exercise. Upon this he applied himself to mitigate the persecutions of the United Greeks, concerning whom a few details are necessary.

This sect had arisen in Russia from a kind of politico-religious compact between the Holy See and the sovereign of Russia about the year 1610, for the purpose of reducing Russia under the papal dominion. In order to effect this, the two powers established a medium sect, partly Romanist, partly Greek: the pope sent Jesuits to teach the necessary doctrine; and the emperor Wladislaw, by a power over the consciences of his people which we can scarcely understand, imposed this body of doctrine as the creed of the provinces on the border of Russia and Poland, whose situation had already exposed them to the influences of both parties. The Unites (as the members of the Greek Church who acknowledge the supremacy of the pope are called in Russia) had already appeared in the north of Italy, in Illyria, and Croatia; but nowhere under similar circumstances. In Russia this sect became a sort of rallying-point for the members of both churches, teaching the Russians gradually to confound distinctions of doctrine, and so to think little of the purer faith and system handed down to them by their ancestors. It has existed to the present day; and so late as 1840 the emperor of Russia, by a dispensing power as strange as that which he exercised originally, decreed that the United Greeks should exist no more. But in the reign of Catherine II., under which Skovorodâ lived, the oppression of the inhabitants of the Ukraine (who had lost the privileges guaranteed to them by Peter the Great after the battle of Poltava) had so far spoiled their disposition, as to render them willing in their turn to oppress any one who was weak enough to fear them. The United Greeks, who had from the commencement of the sect lived under the protection of the throne, were selected as the objects of their persecution. The most rational way of checking these persecutions was to destroy the spirit which gave them birth. To this task Skovorodâ applied himself: in the mixed character of priest and minstrel, he proceeded from village to village through his native Ukraine, preaching the words of peace, singing the religious songs which he had composed for them, and inculcating the same truths under the attractive form of fables. Still he constantly refused to head the sect of the Unites, as his object was not to create or foster schism, but merely to give both parties the benefit of his lessons. By this time the influence which he had justly acquired had pleaded strongly in his favour, and the academy conferred on him the vicarage of his native village. In this station he prohibited all rigour against the persecuted Unites, and endeavoured to gain them over by his doctrines, which were enforced by an eloquence unequalled in the pulpit of South Russia. This at the same time gave an impulse to the clergy of the province, which however unhappily ceased with his death. Even when ordered by the synod, he refused to use the means of persecution, and his refusal led to his ejection from the cure which his exertions had so greatly benefited. His occupation being gone, he resolved to indulge a long-felt desire to visit Rome, the nurse of doctors and confessors, and to view her who, in his eyes, had been glorious as the queen of nations. But almost immediately on his arrival in that city he was recalled by the news of fresh persecutions at home; his works however show what an impression Christian rather than Pagan Rome had left on his mind. His return again checked the fury of the opposite parties; but his exertions, though successful, were only working out his own ruin. The jealousy of the court at St. Petersburg could not allow a single individual, in a cause however humane, to stand in the way of its views. He was considered as a rebel, and orders for his apprehension were issued, which he evaded by taking refuge at the country residence of a noble who had often pressed him to become tutor to his son. This sanctuary of feudal power could not be invaded even by the imperial authority, and he might still have lived in a diminished sphere of usefulness, but he died at the early age of forty-eight, and traditions say that he foretold his own death the day before it occurred, and dug his grave in the garden, unwilling to give this last trouble to the friends to whom he thought he had long enough been a burden.

He was the only author in Little Russia who has yet written in prose: his work called 'Symphonon' is a solitary instance of that kind of composition, and it has the advantage over the works written in Great Russia in being formed rather on the antient Greek model than on that of the Latin or German languages, a style of which Lomonossof was the founder. His translations have been already noticed. Some original essays in the Latin and Russian languages, which remain, show much good taste and elegance, with a great extent of reading, qualifications which were little known in his age or country. With the exception of the common songs of war and love, all traditional songs of the present day are attributed by the bandurists (the troubadours of the Ukraine) to Skovorodâ.

The object of this notice is to rescue from utter neglect the name of one who in his exertions resembled Felix Neff (whose name and character have become generally known through the memoir of the Rev. W. S. Gilly), but has still further claims on our notice as the founder of a national literature.

'Further details, garnished with all the romantic circumstances with which tradition loves to invest its heroes, may be found in the 'Moskowski Telegraph.'

SKULL. [SKELETON.]

SKUNK. [WEASELS.]

SKYE. [Hebrides.]

SKYLIGHT. Including under this term every mode of admitting light into an apartment through its roof or ceiling, we may here briefly notice that particular fashion of one distinguished in Gothic architecture by the name of lantern, though lanterns in Gothic buildings were not so much intended to admit light, as to supply ventilation and the means of escape to smoke. Accordingly their sides were generally left unglazed or open, whence some lanterns were distinguished by the name of Louvre (l'ouvert), and though no longer required for its original purpose, after fireplaces were introduced, the lantern was still retained as a characteristic feature of the hall, not only in monastic and collegiate, but also in domestic architecture, where that apartment showed itself externally as a distinct portion of the building, being carried up as a small turret rising out of the ridge of the roof. The lantern over the hall of the Middle Temple, London, is an example. Lanterns of this kind appear to have been invariably polygonal in plan, octagonal or hexagonal, and had apertures or windows on all sides. But the term lantern is occasionally used in two other significations: it is applied to the lower part of a tower placed at the intersection of the transept with the body of a church, which, being open below, forms a loftier portion of the interior, lighted by windows on each side; and again to an upper open story, that is, one entirely filled with windows, on the summit of a tower, and frequently forming a superstructure different in plan from the rest, as at Fotheringay Church, and that at Boston, Lincolnshire, in both which examples the lantern forms an octagon placed upon a square. The upper portion of the tower of St. Dunstan's, Fleet Street, London, may also be described as a lantern.

Of skylight lanterns, properly so called (that is, which lie nearly in the same plane as the general surface of the ceilings), or of lanterns intended to light the whole of an interior, without other windows in its side walls, no examples are to be met with in our ancient architecture; yet that skylights might be, and probably in some cases have been, introduced into buildings in the Pointed style, without doing violence to its character, by merely perforating some of the compartments and tracery in a groined ceiling. As one instance at least of the kind, we may mention the conservatory that was at Carlton House, which had a roof of fan-tracery, designed after that of Henry VII.'s Chapel, the panels of which were perforated and filled in with glass; but as the ceiling itself was low, and three sides of the building consisted entirely of windows, it conveyed only an imperfect idea of the effect that might be produced in an interior of the kind, if lighted from above only, particularly if the perforated parts of the ceiling were filled in with stained glass.

Notwithstanding both the variety as to design and decoration of which skylights are susceptible, and the picturesque effect produced in an interior where the light falls in from above, so far from having been turned to account for architectural purposes, and studied as ornamental features, skylights have generally been considered and treated as mere shifts and expedients in building, excusable only when resorted to from necessity, and for interior rooms situated where it was impossible to obtain side-windows. Hence scarcely anything on the subject, hardly the bare mention of skylights, is to be met with in architectural works. In Italian buildings such mode of lighting rooms is almost unknown, even where it recommends itself as being greatly preferable to that by side-windows, and as little short of indispensable, as is the case with sculpture and picture galleries, museums, and libraries; and though, as regards these last, it is not very material whether the light is admitted from the sides of the room or from above, the second method is attended with this advantage, that it allows the bookcases to be continued on all sides of the room.

For rooms in general, the plan of lighting them from the ceiling would not be preferable; yet, where suitable opportunity offers, it should be adopted, not only for the sake of variety of effect, but also as affording great scope for ornamental design.

Scarcely anything of the kind occurs in Italian architecture, except it be in the form of a cupola over a central saloon. [Cupola.] Neither is the very best effect usually studied in Italian cupolas and domes, the light being generally admitted partly through small apertures in the concave of the dome itself, or through a mere lantern on its summit, and partly through upright windows in the tambour or cylindrical wall immediately beneath it; instead of being concentrated and diffused through a single large opening, as in the Pantheon at Rome, which, though professedly so much admired, has very rarely indeed been followed as a model by the architects of Italy. The same remark applies to their followers in other countries: so far from studiously availing themselves of opportunities of lighting interiors from above, and varying the means of accomplishing it according to the particular occasion or design, they have rather avoided everything of the kind. Even where it would seem the most direct mode of obtaining light, as in the case where a dome is introduced, the effect that might be so produced is more frequently than not quite neutralised, if not destroyed, by the chief light being derived from lateral windows. Of this we have an instance in St. Stephen's, Walbrook, which, whatever merit it may possess in regard to proportions, most assuredly does not exhibit the most refined taste, the small oval holes in the walls, serving as windows, being in fact so many blemishes in the design. In that and most other examples of the same kind the lantern is so narrow or small in diameter compared with the dome, that it seems as much intended to obstruct as to admit light, and applied rather with a view to external than to internal effect and utility,—as an architectural finish to the outside of the dome, than in order to light the inside of the building.

It seems indeed a strange kind of perverseness, that while lighting interiors entirely from above has been employed not only for picture and sculpture galleries, but also for concert-rooms, lecture-rooms, and other places intended to accommodate an auditory or congregation, it should hardly in any instance have been applied to churches, though by getting rid of apertures in the walls, noises and sounds from the street would be excluded. If the style of the building be Gothic, such mode of course becomes out of the question; for windows in the walls themselves are then essential, being not only characteristic features, but one chief source of decoration, while owing to their being divided by mullions into compartments, and more or less filled up with tracery, the glare of light is properly attempered. With regard to other styles, Grecian or Italian, the case is widely different: in these the windows are frequently no better than so many gaps—mere glazed apertures, which, so far from contributing to decoration, have not even any kind of finishing bestowed upon them, neither architrave, mouldings, nor cornices.

The only instance that we are acquainted with of a church lighted entirely from above, without lateral windows, is that of St. Peter-le-Poor, Broad Street, London, which is a rotunda, covered by a dome, and a large circular lantern, whose tambour forms a sort of clerestory, consisting of a continuous series of arched windows, while the ceiling makes a very flat or slightly concave dome. In point of design this example is not particularly beautiful, but the principle deserves attention. Other ideas of a similar nature have occasionally been thrown out, though not carried to the same extent: the centre of the interior of St. Mary Woolnoth's is covered by a square clerestory lantern, having a large semicircular window on each of its sides,—a peculiarity probably forced upon the architect (Hawksmoor) on account of its being desirable to have no windows on the side towards Lombard Street, and it is only to be regretted that any were allowed on the opposite one, as the whole interior would have been materially improved by the omission of them. A more recent instance is that of Hanover Chapel, Regent Street, London, which has what may be conveniently distinguished by the term *lantern-dome*, viz. a dome where the light is admitted neither through a smaller lantern, or other aperture at its apex, nor through windows in a tambour beneath it, but by a series of windows or glazed panels in the lower part of the concave of the dome itself, similarly curved, and therefore narrower at top than below. Taken by itself, this is a very pleasing feature of the interior, but its effect is counteracted by the numerous windows on the sides, which, in addition to being mere plain openings in the walls, destroy all architectural repose, by the spotty cross-lights which they occasion. Under such circumstances, it is to be wished that the architect could not possibly obtain light except from above. Fortunately this is sometimes the case, if not in regard to churches, in other spacious apartments, where it has been turned to more or less account in the design, and the necessity of lighting them, if not immediately from the ceiling, at least through the upper part of the walls, has given rise to new ideas and novel architectural combinations. Soane was, we believe, almost the first who attempted to give importance and decorative character to skylights and *ceiling windows*, or windowed ceilings, as they may be termed, making them ornamental features in his interiors, varied in their design, and producing great diversity of striking effects, occasionally heightened by the light being transmitted through tinted glass, so as to diffuse a warm sunny glow over the apartment. The offices at the Bank of England afford many studies of the kind, while his own house (now the Soanean Museum) shows what he accomplished by a similar mode of treatment upon a very limited scale. It cannot be said that the taste which he otherwise displayed in internal architecture, even in those instances, was the most refined, for it was exceedingly unequal; yet many valuable hints may be derived from what he did in that way, and it seems to have had the good result of inducing others to render such method of lighting interiors highly effective and ornamental.

How very different that which is essentially the same mode in itself, becomes, according as it is treated, may be seen in two examples which resemble each other so nearly in some other respects, that the comparison between them becomes the more instructive, and the contrast the more striking. We have in London two narrow streets of shops, exclusively for foot passengers, covered in above, and consequently lighted through that covering; but while that termed the Burlington Arcade is no more than an ordinary skylight—just what may be seen in a workshop—continued from end to end of the building, the roof of the Lowther Arcade is formed into a series of arches and elegant pendentive domes, each of which terminates in an eye or circular skylight. Somewhat similar to this last, though less ornamental in design, is the roof of the Arcade or Gallery on the west side of the Italian Opera-house.

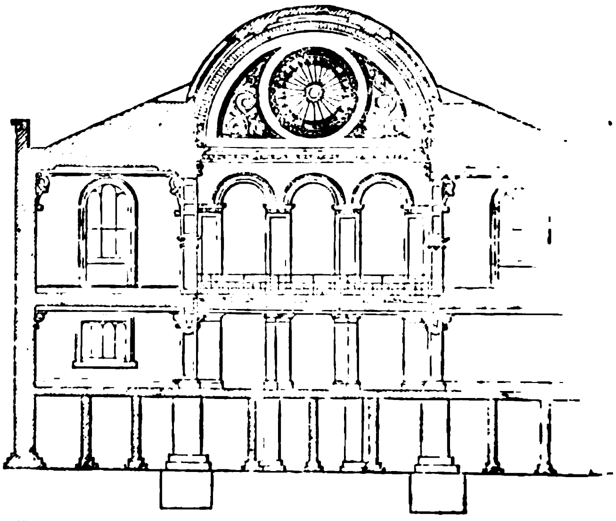
The simplest and most ordinary form of skylight consists merely of a sash or framing fixed into an aperture in a roof or ceiling, in a slanting direction, in order to throw off the rain, and either of one or more planes according to its size or other circumstances. If square in plan, a skylight of this sort is usually composed of four triangular surfaces, like a low pyramid; if oblong, of four sloping planes, after the manner of a *hipped* roof, with a ridge. Sometimes the whole of a room, or other area, is covered by a glazed ceiling of the kind, merely divided into such number of compartments or separate lights as its construction may require, as is the case with a portion of the Corn Exchange, Mark-lane. The effect however then becomes rather that of an open court than a covered hall or room, on which account, convenient as it may be in peculiar cases, it is not at all adapted for apartments generally which may otherwise require to be so lighted, and least of all for such as are intended to be chiefly used by night. Yet where the object is not to admit light into a ceiled room, but merely to exclude the weather from what must else be an uncovered court, such glazed roofs may very properly be applied; and it is rather strange there should be no intention of so covering in the area of the new Royal Exchange, and thereby protecting it from rain and damp.

To attempt to describe all the various forms of skylights and lanterns that have hitherto been employed, would require considerable research for examples of them, and also that plans and other delineations should be given of some of the more complex designs. Such a systematic and complete elucidation of the subject would form an interesting architectural volume. Here, on the contrary, we can merely advert to some of the principal varieties. Those more generally used for picture galleries, libraries, and other apartments of that class, are also the simplest in form, being lanterns, not like those in Gothic architecture, of narrow and straight proportions, but spacious and low, and occupying a considerable surface of the ceiling. The light is admitted through the sides of the lantern, which are mostly filled in with panes of glass, so as to form a window continued on every side, without other divisions than the bars in its frame-work. The sides of the lantern are made either vertical or sloping; by which latter method more light is obtained, the upper ceiling, or that of the lantern, being thereby reduced, as compared with the opening of the lantern itself. Therefore in such cases its sides may be curved, instead of being made merely sloping planes. The upper ceiling should be coffered, or otherwise ornamented in accordance with the lower one, and rather in a greater than in a less degree, both on account of its forming a compartment where decoration is looked for, and because the enrichments bestowed upon it display themselves to greater effect. Where, as will frequently happen, more than one lantern is required, the centre one may be larger, that is, longer than the others, and somewhat loftier also, besides being more or less distinguished from them in its decorations. If a room be coved and also lighted from above, the lantern may occupy the whole horizontal surface, so that its ceiling becomes in a manner that of the room.

Of other forms of lanterns and skylights in picture and sculpture rooms, examples are furnished by those at the British Museum, National Gallery, and Fitzwilliam Museum, Cambridge, some of which are double skylights, a smaller one being raised over the first one. In a small octagon room in the second building there is also an instance of a lantern dome above a square opening in the ceiling; which kind of contrast is the reverse of that shown in one of Soane's buildings, where a square lantern is seen through an oval opening beneath it. Among other novel contrivances, Soane occasionally introduced narrow skylights or glazed panels around the ceiling of a room, not for the purpose of lighting the whole of it, but of obtaining a strong light immediately on the upper part of the walls, and on pictures in that situation, an effect rendered the more striking in consequence of such openings being made above the general level of the ceiling, and therefore in some measure screened from view. At other times he occasionally placed a lantern immediately upon the walls of a room, that is, he carried up the latter above the roof, opening windows in it on every side, immediately below the ceiling.

Somewhat similar to, although also different in effect from, the mode just now pointed out, of admitting light through openings in the border of a ceiling, is that of obtaining it through the cove of a room, as has been done by Barry in the saloon of the Reform Club-house, where the whole of the cove is perforated, and filled in with small panes of cut glass, so as to produce a rich diapered surface throughout. Once adopted, the same idea may be varied in a great number of ways, by making separate apertures, for instance, in the cove, and filling them in with stained glass, so as to produce the effect of painted transparent panels, which effect might be rendered even still more striking by night than by day, by means of lamps or gas-burners placed outside. That the same mode of lighting at night might be applied in other cases is sufficiently obvious.

There are a variety of other modes of lighting rooms from their ceilings, which we have not yet mentioned, and some of which it would be difficult to describe intelligibly by words; we shall therefore merely notice one or two of them in general terms. Of an arched skylight ceiling, divided into compartments by intersecting ribs, an instance is furnished in one of the offices of the Bank of England, built a few years ago by Cockerell, and shown in the 'Companion to the Almanac,' for 1836. The roof of the Pantheon Bazaar, Oxford-street, on the contrary, though also arched, is treated altogether differently; for instead of being glazed along its centre, it has a series of sashes or glazed panels on each side, as shown in the small section of it here given



Transverse Section of the Great Hall of the Pantheon, looking southward.

The Waterloo gallery or saloon at Windsor Castle has a [illegible] ceiling of unusual design, not so much on account of the style of decoration as of its arrangement and the mode in which the light is admitted. The only other we know we shall add, and it deserves to be noticed for the novelty of the idea, is that of a skylight to a shop at Southampton, forming a dome raised upon four columns, square in its plan, and semicircular in section, and entirely filled in with stained glass of various colours, forming a mosaic pattern in the Alhambra style, executed, we believe, from designs by Mr. Owen Jones.

SKYROS (Σκῦρος), an island in the Ægean, lying to the east of Euboea or Negroponte, and to the west of Psara, but nearer to the former, in 38° 50′ N. lat. and 24° 32′ E. long. The earliest inhabitants were Pelasgians and Carians, according to Nicolaus, quoted by Stephanus Byzantinus (Σκῦρος), and Dolopes (Thucyd., i. 98). Homer records the capture of it by Achilles (*Il.*, ix. 668); who is said to have been concealed there disguised in female attire before the Trojan war. Theseus was sent into exile to this island, and was murdered by Lycomedes, its king, who became jealous of his popularity. (Pausan., iii. 3.) In 470 B.C. it was taken by Cimon, when the inhabitants were enslaved, and a colony was sent thither from Athens (Thucyd., i. 98), but not in consequence of the oracle which directed the removal of the bones of Theseus, as Pausanias asserts, for the discovery of the tomb and the disinterment did not take place till six or seven years after the capture. It afterwards passed out of the hands of the Athenians, but was restored to them by the peace of Antalcidas, B.C. 387. It was taken by Demetrius Poliorcetes, and again given to Athens, B.C. 196, in the treaty between Rome and Philip of Macedon. (Livy, xxxiii. 30.)

In the division of the Greek empire by Constantine Porphyrogenitus, Skyros was placed in the Thema Ægæum Pelagus, and in the Synecdemus of Hierocles, in the Province Hellados Achaia. After the taking of Constantinople by the Latins, it was seized by Andrew and Jerome Ghisi. It afterwards formed part of the duchy of Naxos, and finally of the Turkish empire. In 1822 the Skyriotes were among the islanders who renounced their allegiance to the Porte, and repulsed the troops sent against them with great slaughter. The island was however restored at the close of the Greek war to the Turks, by the protocol of 1829.

According to Dapper the bearings of Skyros are as follows:—Ten or eleven leagues to the north of Cap Mantelo, the south-east cape of Eubœa; on the east, it is sixteen or eighteen leagues from Lesbos, and the same on the south-east from Lemnos; and on the north-west six or seven leagues from the island of Skopelo. Tournefort states the circumference at sixty miles. On the west side is a large bay, with several islands at the mouth. The harbour here is called Kalamitza by the Greeks, and by the Italians Gran Spiaggia. Opposite to this, on the other side of the island, is Port Akhili. The isthmus between these two points divides the island into two parts; the southern portion is uncultivated, full of high mountains, intersected by deep gullies, and rugged and bare, except at their summits, where they are covered with oak, fir, and beech.

Mount Kochyla, on the east coast, a little to the south of Port Akhili, is 2500 feet high, according to some authorities. At the southern extremity of the island is a port called Trispuckaes, a corruption of Tre Bocche, or the three mouths. It is surrounded by wooded hills, and has three entrances, the one on each side being about one-third of a mile in width, and the middle one rather narrower. They are all safe and deep. There is about twenty fathoms water in the centre of the harbour.

The northern division of the island is less mountainous. The town of St. George, on the east coast, covers the north and west sides of a high rocky peak, which terminates abruptly in the sea. On the table summit of this hill are the ruins of a castle built during the middle ages, and many houses, all abandoned, which are used by the inhabitants to keep stores in. The houses of Skyros are flat-roofed, of two stories, the lower of stone, the upper of wood, surmounted by terraces covered with earth. This hill was the site of the ancient Acropolis. The remains of Hellenic walls may be traced round the edge of the precipices, particularly at the north end of the castle, and others halfway down the peak, or among the modern houses. The greater part of the ancient city lay to the east, near the sea. In this direction there is a large semicircular bastion almost entire. Thence the wall is continued along the slope above the sea as far as a round tower, half of which is still standing. Beyond this are the remains of another tower, and a wall from each connects the city with the sea, like the long walls of Athens and other ancient cities. Tournefort (*Voyage du Levant*) makes mention of the ruins of a temple of Pallas near the town. This goddess was worshipped here, as appears from Statius (*Achill.*, i. 285).

In the neighbourhood of St. George is a plain four square miles in extent, which bears corn, grapes, and figs. There is another at Kalamitza, which is also fertile. On the steep ground in the north part of the island madder is grown. The wheat of Skyros equals in quality that of any island in the Ægean. Its productions are, 10,000 barrels of wine in a good vintage, three-fourths of which are exported; 15,000 kils of corn, 3000 of which are exported; 500 kantars of [illegible]; 2000 okes of wax; 8000 okes of honey; 100,000 oranges and lemons; and 500 kantars of madder. There are a few cows, and about 15,000 head of sheep and goats, of which 3000 are annually exported. The taxes are 50 purses, paid by 100 families living in St. George. There are three barks belonging to the island, and many feluccas built with the fir of the mountains. The oak timber is only used for firewood. (Leake's *Travels in Northern Greece.*) In 1813 Skyros had 12 ships, with an average tonnage of 106; average number of crews 12; of cannon 3. (Pouqueville, *Voyage dans la Grèce.*) The inhabitants are good seamen, and fond of the chase. They retain more ancient customs than most of the islanders in the Archipelago, and are attached to the early Greek traditions. The memory of Achilles is still preserved in the name Akhili (Ἀχίλλειον). Skyros was much celebrated among the ancients for its red and white marble, which, as Strabo informs us, was used at Rome in preference to white marble. (Strabo, ix.; Casaub.) There is a bishop who resides in the deserted part of St. George. His see is dependent on that of Rhodes. Tournefort mentions two monasteries—St. George and St. Dimitri.

SLANDER consists in the malicious speaking of such words as render the party who speaks them in the hearing of others liable to an action at the suit of the party to whom they apply.

Slander is of two kinds: one, which is actionable, as necessarily importing some general damage to the party who is slandered; the other, which is only actionable where it has actually caused some special damage. The first kind includes all such words as impute to a party the commission of some crime or misdemeanour for which he might legally be convicted and suffer punishment, either by the general law, or by the custom of a particular place, as where one asserts that another has committed treason, or felony, or perjury, &c. It also includes such words spoken of a party, with reference to his office, profession, or trade, as impute to him malpractice, incompetency, or bankruptcy; as of a magistrate, that he is partial or corrupt; of a clergyman, that 'he preaches lies in the pulpit;' of a barrister, that 'he is a dunce, and will get nothing by the law;' of a physician, that 'he is an empiric, a mountebank;' of an attorney, that 'he hath no more law than a goose, bull,' &c., or that 'he is no more lawyer than the devil;' of a trader, that he has failed, or uses deceit in his trade, &c.; or that charge a party with having, at the time being, an infectious disease which prevents his having intercourse with others; or that tend to the disherison of a party, as where it is said of one who holds lands by descent, that he is illegitimate. Where a party is in possession of lands which he desires to sell, he may maintain an action against any one who slanders his title to the lands; as by stating that he is not the owner, or that another has a lease of the lands or is in possession of a mortgage or other incumbrance upon them. With respect to the second class of slander, the law will not allow damage to be inferred from words which are not in themselves actionable, even although the words are untrue and spoken maliciously. But if, in consequence of such words being so spoken, a party has actually sustained some injury, he may maintain an action of slander against the person who has uttered them. In such case the injury must be some certain actual loss, and it must also arise as a natural and lawful consequence of speaking the words. No unlawful act done by a third person, although he really was moved to do it by the words spoken, is such an injury as a party can recover for in this action. Thus, the loss of the society and entertainment of friends, of an appointment to some office, the breach of a marriage engagement caused by the slanderer's statement, are injuries for which a party may recover damages. But he can have no action because in consequence of such statement certain persons, to use an illustration of Lord Ellenborough's, 'have thrown him into a horse-pond by way of punishment for his supposed transgression.'

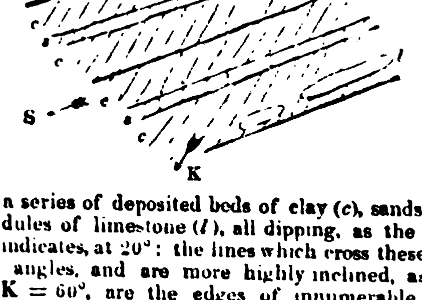
With respect to both kinds of slander, it is immaterial in what way the charge is conveyed, whether by direct statement, or obliquely, as by question, epithet, or exclamation. But the actual words used must be stated in the declaration, and upon the failure to prove them as stated, the plaintiff will be nonsuited at the trial: it is not sufficient to state the meaning and inference of the words. They will be interpreted in the sense in which they are commonly used, but where they are susceptible of two meanings, one innocent, the other defamatory, the innocent interpretation is to be preferred. Where words are equivocal either in their meaning or their application, a parenthetical explanation may be inserted in the declaration. This is called an innuendo. It may be employed to explain and define, but not to enlarge or alter, the meaning or application of the words spoken. The declaration must state the publication of the words, that is, that they were spoken in the hearing of others, and spoken maliciously. Two cannot join in bringing one action of slander, except in the case of husband and wife, or of partners for an injury done to their joint trade; nor can an action be brought against two, except a husband and wife, where slanderous words have been spoken by the wife. Where an action is brought for slanderous words spoken of a party relative to his office or profession, the declaration must state that he was at the time of speaking the words in possession of the office or engaged in the profession. And where the knowledge of extraneous facts is necessary to show the application of the slander, these should be stated in the introductory part of the declaration.

In answer to an action of slander the defendant may plead that the words spoken were true, or that they were spoken in the course of a trial in a court of justice, and were pertinent to the case; or formed the subject of a confidential communication, as where a party on application *bonâ fide* states what he believes to be true relative to the character of a servant, or makes known facts merely for the purpose of honestly warning another in whom he is interested. (Com., *Dig.*, 'Action on the case for Defamation,' D. 1, &c.)

SLANE. [MEATH.]

SLANEY, River. [WEXFORD.]

SLATE. By some geological writers the laminar structures which prevail in many stratified and in some metamorphic rocks are called slaty or schistose; but, in consequence of the progress of investigation, one of these structures, locally superinduced in deposited strata, which is characterized by planes of cleavage generally meeting those of deposition at considerable angles, is specially called the slaty structure. If, in the diagram below, *c*, *s*, *l*, represent in section a series of deposited beds of clay (*c*), sandstone (*s*), and nodules of limestone (*l*), all dipping, as the arrow S (south) indicates, at 20°: the lines which cross these beds at oblique angles, and are more highly inclined, as in the arrow K = 60°, are the edges of innumerable parallel planes of cleavage, which are continuous through the finely argillaceous beds *c*; more or less twisted in and about the limestone nodules *l*; more or less interrupted by the arenaceous beds *s*, or represented therein by lines more nearly rectangled to the plane of deposition. The law here indicated of the want of coincidence in the planes of cleavage and deposition is almost universally observed in nature. Nearly horizontal strata are crossed by inclined cleavage; highly inclined strata are traversed by nearly vertical cleavage. In strata which dip different ways from an axis or to an axis, the cleavage planes are sometimes found to be parallel throughout the mass on both sides of the axis; and even where strata are variously contorted, they are frequently dissected through a great part or the whole of their mass by cleavage planes passing in one direction. Hence the conclusion is obvious that this slaty structure, this monohedral symmetry (if we may not call it crystallization), is the fruit of a general cause acting subsequently to the deposition and disturbance of the strata, capable of pervading and rearranging the particles so as to polarize and systematize their mutual attractions, but not to fuse them together, destroy their original distinctness, or obliterate the evidence of their original condition. This force was so general, that along many miles of country, as, for example, in the whole Snowdonian chain, one particular direction (north-north-east), in North Devon and Pembrokeshire another (nearly east and west), is found to prevail more or less distinctly in all the rocks; though, as before observed, arenaceous and pebbly beds are least influenced by it, and limestones are unequally and variously affected.



This dependence of the slaty structure on the nature of the rock is sometimes very positively pronounced, as in some classes of rock the cleavage does change and even reverse its inclination where contortions prevail. (This is very observable in some cases of cleavage in the old red sandstone of Pembrokeshire.) On a first view it appears to be equally dependent on geological time, since it is principally among the older strata that it is well exhibited on a large scale; but on this head doubt arises, when we find the Silurian rocks, which are not slaty at Ludlow, become so near Llandovery; the old red-sandstone slaty in Pembrokeshire and not so in Monmouthshire; the mountain limestone shales slaty near Tenby and not so in Yorkshire; the lias shales slaty on the northern slopes of the Alps, but not so in England.

There are then *local conditions* which influence the development of slaty cleavage, and it is essential to a general solution of the problem which this structure involves, that these conditions should be determined. Proximity to rocks of igneous origin has been freely appealed to for this purpose; but this appears an insufficient and not often applicable cause. The most general condition which has occurred to our observation is the fact of remarkable displacement of the strata on one or more anticlinal or synclinal axes; and it is of consequence to this inference to remark that very often, approximately or even exactly, the horizontal edge ('strike') of the inclined cleavage planes coincides with the axis of movement (and therefore with the strike) of stratification. *Pressure* in some peculiar application, appears to us to be indicated by all the phenomena as the grand agent in the production of slaty cleavage. Only one tolerably successful effort has been made experimentally to reproduce this structure by art. Mr. R. W. Fox has caused electrical currents to traverse a mass of moist clay, and has observed in consequence the formation of numerous fissures more or less similar to slaty cleavage, in planes parallel to the vertical bounding surfaces of the mass, and at right angles to the electrical currents. The exact application of this experiment is not understood. Perhaps however, conjoined with the admission that the great movements of strata, by which apparently slaty cleavage was determined, depended on disturbed equilibrium of internal heat, which might, or rather must, have developed electrical currents, this solitary experiment may be the commencement of a right mode of more extensive inquiry embracing the united circumstances of chemical nature, stratified arrangement, disturbed position, and proximity of igneous rocks, which must all be included in a good theory of slaty cleavage.

For economical purposes there appears little chance of obtaining in the British Islands good *slate* (properly so called) from any but the antient argillaceous strata superposed on mica schist and gneiss, and covered by old red sandstone or mountain limestone. From these strata in Scotland, Cumberland, Westmoreland, Yorkshire, Charnwood Forest, North Wales abundantly, South Wales, Devonshire, Cornwall, the north and south of Ireland, slates of various value are dug. The thin flagstone of the coal formation in many parts of England and Wales, the laminated sandy limestone of Stonesfield, Collywiston, &c., which are often called slates, and are extensively used in roofing, are all obtained by natural partings parallel to the strata. True slate is split by wedges from the apparently solid those plates often so more distinguishable than those of a real fossil. In colour it is purple, blue, green, yellowish, or brown, or striped across the planes. In some slates (those of Westmorland, Ingleton, &c.) crystals of cubical iron pyrites are scattered. Much of the Cumberland slate appears full of *fragments* (Borrowdale), and some contains chiastolite (Skiddaw).

SLAVE, SLAVERY. The word slavery has various acceptations, but its proper meaning seems to be the condition of an individual who is not master of his own person, and who is also the property of another or others. Such was the condition of the 'servi,' or slaves among the Romans and Greeks; such is still that of the slaves in Eastern countries, and that of the negro slaves in many parts of Africa and America. A mitigated form of this condition exists in the case of the serfs in Russia and Poland, and of a similar class in India and some other parts of Asia. The Russian and Polish serf is bound to the soil on which he is born; he may be sold or let with it, but cannot be sold away from it without his consent; he is obliged to work three or four days in the week for his master, who allows him a piece of land, which he cultivates. He can marry, and his wife and children are under his authority till they are of age. He can bequeath his chattels and savings at his death. His life is protected by the law. The real slave, in the Greek and Roman times, had none of these advantages and securities, any more than the negro slave of our own times; he was bought and sold in the market, and was transferred at his owner's pleasure; he could acquire no property; all that he had was his master's; all the produce of his labour belonged to his master, who could inflict corporal punishment upon him; he had no right of marrying; and if he cohabited with a woman, he could be separated from her and his children at any time, and the woman and children sold; he was, in short, in the same condition as any domesticated animal. The distinction therefore between the slave and the serf is essential. The villeins of the middle ages were a kind of serfs, but their condition seems to have varied considerably according to times and localities, and in many cases it appears to have been more advantageous. The villeins or coloni were in a less dependent condition than the adscriptitii, or even the actual Russian and Polish serfs. This subject however is treated under VILLENAGE. Servitude of every kind is now abolished in the greater part of Europe. In the present article we treat only of the real slave of ancient and modern times.

Slavery, properly so called, appears to have been, from the earliest ages, the condition of a large proportion of mankind in almost every country, until those comparatively recent times, when it has been gradually abolished by all Christian states, at least in Europe. The prevalence of domestic slavery constitutes one great difference between ancient and modern society. Slavery existed among the Jews: it existed before Moses in the time of the Patriarchs; and it existed, and still continues to exist, all over the East. The 'servants' mentioned in Scripture history were mostly domestics and perpetual slaves; they were strangers, either taken prisoners in war or purchased from the neighbouring nations. They and their offspring were the property of their masters, who could sell them, and inflict upon them corporal punishment, and even in some cases could put them to death. The three hundred and eighteen servants 'born in Abraham's own house' (*Genesis*, xiv. 14) were of this description. But the Hebrews had also slaves of their own nation. These were men who sold themselves through poverty, or those were insolvent debtors, or men who had committed a theft, and had not the means of making restitution as required by the laws, which was to double the amount, and in some cases much more (*Exodus*, xxii.). Not only the person of the debtor was liable to the claims of the creditor, but his power extended also to the debtor's wife and children. Moses mitigated the condition of slavery. He drew a wide distinction between the alien slave and the native servant. The latter could not be in perpetual bondage, but might be redeemed; and if not redeemed, he became free at the completion of the seventh year of his servitude. Again, every fifty years the jubilee caused a general emancipation of all native servants. During the time of their servitude they were to be treated with kindness, 'for the children of Israel are servants unto me,' saith the Lord. 'Both thy bondmen and thy bondmaids which thou shalt have shall be of the heathen that are round about you; of them shall you buy bondmen and bondmaids. Moreover, of the children of the strangers that do sojourn among you, of them shall ye buy, and of their families that are with you which they begat in your land; and they shall be your possession. And ye shall take them as an inheritance for your children after you, to inherit them for a possession; they shall be your bondmen for ever; but over your brethren the children of Israel ye shall not rule one over another with rigour. And if a sojourner or stranger wax rich by thee, and thy brother that dwelleth by him wax poor, and sell himself unto the stranger or sojourner by thee, or to the stock of the stranger's family; after that he is sold he may be redeemed again; one of his brethren may redeem him. . . . And if he be not redeemed in these years, then he shall go out in the year of the jubilee, both he and his children with him.' (*Leviticus*, xxv. 44-54.)

The sources of the supply of slaves have been the same both in ancient and modern times. In ancient times all prisoners were reduced to slavery, being either distributed among the officers and men of the conquering army, or sold by auction for the benefit of the troops. In very remote times, when the early Æolian and Ionian colonies settled in the islands of the *Ægean Sea*, or on the coast of Asia Minor, it was a frequent practice with them to kill all the adult males of the aboriginal population, and to keep the wives and children. As however dealing in slaves became a profitable trade, the conquered, instead of being killed, were sold, and this was so far an improvement. Another source of slavery was the practice of kidnapping men and women, especially young persons, who were seized on the coast, or enticed on board by the crews of pirate vessels; and most vessels were piratical in the earlier ages. The Phœnicians, and the Etruscans or Tyrrhenians, had the character of being men-stealers, and also the Cretans, Cilicians, Rhodians, and other maritime states. Another source was, sale of men, either by themselves through poverty and distress, or by their relatives and superiors, as is done now by the petty African chiefs, who sell not only their prisoners, but often their own subjects, and even their children, to the slave-dealers. The sale of Joseph by his brethren to the Midianite or Arabian merchants, who sold him again in Egypt, is a proof of the antiquity of the practice.

The sequel also shows that in Egypt, unlike most other countries of antiquity, the life of a slave was protected by law; for Joseph's master, when he had reason to believe him guilty of a heinous offence, did not put him to death, but sent him to prison, there to await his trial; and this inference is confirmed by Diodorus, who, in speaking of the laws of the Egyptians, says, that whoever murdered a man, whether free or slave, was punished with death.

Among the Greeks slavery existed from the heroic times; and the purchase and use of slaves are repeatedly mentioned by Homer. The household of Ulysses was served by slaves, over whom their master had power of life and death. The use of such domestics became concentrated, in those early ages, in the houses of the great, who alone could afford the purchase money. As war and piracy became frequent, slaves taken or bought became more plentiful and cheaper, and they were chiefly employed in handicraft and household labours. The labours of husbandry were performed in some instances by poor freemen for hire, but in most places, especially in the Doric states, by a class of bondmen, the descendants of the older inhabitants of the country, resembling the serfs of the middle ages, who lived upon and cultivated the lands which the dominant or conquering race had appropriated to themselves; they paid a rent to the respective proprietors, whom they also attended in war. They could not be put to death without trial, nor be sold out of the country, nor separated from their families; they could acquire property, and were often richer than their masters. Such were the Clarotæ of Crete, the Penestæ of Thessaly Proper, and the Helots of Sparta, who must not be confounded with the Periœci, or country inhabitants of Laconia in general, who were political subjects of the Doric community of Sparta, without however being bondmen. [SPARTA.] In the colonies of the Greeks beyond the limits of Greece, the condition of the conquered natives was often more degraded than that of the bondmen of the parent states, because the former were not Greeks, but barbarians, and they were reduced to the condition of slaves. Such was the case of the Kallirioi or Kallikyrioi of Syracuse, and of the native Bithynians at Byzantium. At Heraclea in Pontus the Mariandyni submitted to the Greeks on condition that they should not be sold beyond the borders, and that they should pay a fixed tribute to the ruling race.

The Doric states of Greece had few purchased slaves, but Athens, Corinth, and other commercial states had a large number, who were mostly natives of barbarous countries, according to the Greek phraseology. The slave population in Attica has been variously estimated as to numbers, and it varied of course considerably at different periods, but it appears that in Athens, at least in the time of its greatest power, they were much more numerous than the freemen. [ATHENS.] From a fragment of Hyperides preserved by Suidas (*v.* *ἀπεψηφίσατο*), the number of slaves appears to have been at one time 150,000, who were employed in the fields and mines of Attica alone. Even the poorer citizens had a slave for their household affairs. The wealthier citizens had as many as fifty slaves to each family, and some had more. We read of philosophers keeping ten slaves. There were private slaves belonging to families, and public slaves belonging to the community or state. The latter were employed on board the fleet, in the docks and arsenal, and in the construction of public buildings and roads. Pausanias says that slaves were introduced for the first time among the land forces at the battle of Marathon; but this was, it seems, in the ranks of the Platæans, for the Athenians did not introduce them into their armies till a later period. At the sea fight of Arginusæ there were many slaves serving in the Athenian fleet, and they were emancipated after the battle. Again at Cheronæa the Athenians granted liberty to their slaves who served in the army.

Slaves were dealt with like any other property: they could be given as pledges; they worked either on their master's account or on their own, in which latter case they paid a certain sum to their master; or they were let out on hire as servants or workmen, or sent to serve in the navy of the state, the master receiving payment for their services. Mines were worked by slaves, some of whom belonged to the lessees of the mine, and the rest were hired from the great slave proprietors, to whom the latter paid a rent of so much a head, besides providing for the maintenance of the slave, which was no great matter. They worked in chains, and many of them died from the effect of the unwholesome atmosphere. Nicias the elder had 1000 slaves in the mines of Laurium; others had several hundreds, whom they let to the contractors for an obolus a day each. At one time the mining slaves of Attica murdered their guards, took possession of the fortifications of Sunium, and ravaged the surrounding country. (Fragment of Posidonius's Continuation of Polybius; see Boeckh's *Public Economy of Athens*, b. i.) The thirty-two or thirty-three iron-workers or sword-cutlers of Demosthenes annually produced a net profit of thirty minæ, their purchase value being 190 minæ; whilst his twenty chair-makers, whose value was estimated at 40 minæ, brought in a net profit of 12 minæ. (Demosthenes *Against Aphobus*, i.) The leather-workers of Timarchus brought in to their master each two oboli a day, and their foreman three. The master furnished the raw materials. The price of slaves at Athens varied from half a mina to five and ten minæ a head: a common mining slave, in the age of Demosthenes, cost from 125 to 150 drachmæ. The profits derived from slave labour must have been very high, as the owner had to replace his capital and to obtain the usual rate of interest for his money, which was a high rate, and the slave was only valuable so long as he had health and was able to work. There was also the danger of his running away, especially in war time. Antigenes of Rhodes was the first to establish an insurance for slaves. For a yearly contribution for each slave serving in the army he undertook to make good his price to the owner, in case of his running away.

The antients were so habituated to the sight of slavery, that none of the antient philosophers make any objection to its existence. Plato, in his 'Perfect State,' desires only that no Greeks should be made slaves. The only states of Greece in which no slaves appear to have been introduced were Locris and Phocis, probably by reason of the poverty of the people and the simplicity of their manners.

The Etruscans and other antient Italian nations had slaves, as is proved by those of Vulsinii revolting against their masters, and by the tradition that the Bruttii were runaway slaves of the Lucanians. The Campanians had both slaves and gladiators previous to the Roman conquest. But the Romans by their system of continual war caused an enormous influx of slaves into Italy, where the slave population at last superseded almost entirely that of the free labourers.

The Roman system of slavery had peculiarities which distinguished it from that of Greece. One distinction existed in principle. The Greeks considered slavery to be derived from the law of nature and from permanent diversities in the races of men. (Aristotle, *Polit.*, i.) The Romans admitted in principle that all men were originally free (*Instit.*, i., tit. ii.) by the law of nature (jure naturali), and they ascribed the rights of masters over their slaves entirely to the will of society, to the 'jus gentium,' if the slaves were captives taken in war, whom the conquerors, instead of killing them, as they might have done, spared for the purpose of selling them, or to the 'jus civile,' when a man of full age sold himself. It was a rule of Roman law that the offspring of a slave woman followed the condition of the mother. (*Inst.*, i., tit. 3.) Emancipation was much more frequent at Rome than in Greece: the emancipated slave became a freedman (libertus), but whether he became a Roman citizen, a Latinus, or a Dediticius, depended on circumstances. If the manumitted slave was above thirty years of age, if he was the Quiritarian property of his manumittor, and if he was manumitted in due form, he became a Roman citizen. At Athens, on the contrary, emancipation from the dominion of the master was seldom followed by the privileges of citizenship even to a limited extent, and these privileges could only be conferred by public authority. It is true, that at Rome, under the empire, from the enactment of the Lex Aelia Sentia, passed in the time of Augustus, there were restrictions, in point of number, upon the master's power of freeing his bondmen and raising them to the rank of Roman citizens; still in every age there was a prospect to the slave of being able to obtain his freedom.

The slaves of the Romans were called by the names of servi, servitia, mancipia, famuli, and, as being members of a familia, also familiares. A slave was often called 'puer,' which was sometimes contracted into 'por,' and added to the master's name, as 'Marcipor,' the slave of Marcus. Slaves were not considered members of the community: they had no rights, and were not legally considered as persons, but as things or chattels. They could neither sue nor be sued, and they could not claim the protection of the tribunes. When an alleged slave claimed his freedom on the plea of unjust detention, he was obliged to have a free protector to sue for him, until Justinian (*Code*, vii., tit. 1. 7, 'De adsertione tollenda') dispensed with that formality. Slaves had no connubium, that is, they could not contract a Roman marriage; their union with a person of their own rank was styled contubernium, and cohabitation with another person was not adultery; and even the Christian church for several centuries did not declare the validity and indissolubility of slave marriages. At last the emperor Basilius allowed slaves to marry and receive the blessing of the priest, and Alexius Comnenus renewed the permission. As slaves had no connubium, they had not the parental power (patria potestas) over their offspring, no ties of blood were recognised among them, except with respect to incest and parricide, which were considered as crimes by the law of nature. Though slaves were incapable of holding property, they were not incapacitated from acquiring property, but what they did acquire belonged to their masters. They were often allowed to enjoy property as their own, 'peculium,' consisting sometimes of other slaves, but they held it only by permission, and any legal proceedings connected with it could only be conducted in the name of the master, who was the only legal proprietor. No slave could hold a public office, and if a slave unknown to be such had obtained a responsible office, it was a question among the jurists whether his acts would be valid or null. Until the latter period of the republic, slaves and even freedmen were not admitted into the ranks of the army. In cases of urgent public danger, such as after the defeat of Cannæ, slaves were purchased by the state and sent to the army, and if they behaved well, they were emancipated. (Livy, xxii. 57, and xxiv. 14-16.)

Male slaves were not permitted by law to wear the toga and bulla, nor females the stola, but otherwise there was no fixed distinctive costume for them, and they were mostly dressed like poor freeman, who could not afford to wear the toga. A distinct dress for slaves had been proposed in the decline of the republic, but the proposition was rejected upon some senator adverting to the danger of showing the slaves how much superior in numbers they were to the freemen. Slaves were forbidden the use of horses, carriages, or litters (lecticæ) within the walls of the city

They were not however denied the rights of burial, and numerous inscriptions attest that monuments were often erected to the memory of deceased slaves by their masters, their fellows, or friends, some of which bear the letters D. M. 'Diis Manibus;' for according to the Roman principle that slavery was not by nature, but was the effect of law, death was considered as putting an end to the legal distinction between slaves and masters, and the manes of a departed slave might be an object of reverence even to a freeman. Slaves were often buried in the family burying-place of their masters. The 'sepulchretum' or burial-vaults of the slaves and freedmen of Augustus and his wife Livia, discovered in 1726 near the Via Appia, and which has been illustrated by Bianchini and Gori, and another in the same neighbourhood also belonging to the household of the early Cæsars, and containing at least 3000 urns with numerous inscriptions, which have been illustrated by Fabretti, throw much light upon the condition and domestic habits of Roman slaves in the service of great families. [Bianchini, Francesco.]

With regard to the classification and occupations of slaves, the first division was into public and private. Public slaves were those which belonged to the state or to public bodies, such as provinces, municipia, colleges, decuriæ, &c., or to the emperor in his sovereign capacity, and employed in public duties, and not attached to his household or private estate. Public slaves were either derived from the share of captives taken in war, which was reserved for the community or state, or were acquired by purchase and other civil process. Public slaves of an inferior description were engaged as rowers on board the fleet, or in the construction and repair of roads and national buildings. Those of a superior description were employed as keepers of public buildings, prisons, and other property of the state, or to attend magistrates, priests, and other public officers, as watchmen, lictors, executioners, watermen, scavengers, &c.

Private slaves were generally distributed into urban and rustic; the former served in the town houses, and the others in the country. Long lists of the different duties performed by slaves of each class are given by Pignorius, 'De Servis et eorum apud Veteres Ministeriis,' Amsterdam, 1674; Popma, 'De Operis Servorum,' ibid., 1672; and Blair, 'An Inquiry into the State of Slavery amongst the Romans,' Edinburgh, 1833, which is a very useful little book. It will be enough here to say, that for all the necessities of domestic life, agriculture, and handicraft, and for all the imaginable luxuries of a refined and licentious people, there was a corresponding denomination of slaves. Large sums were occasionally paid for slaves of certain peculiar kinds, some of which we should consider the least useful. Eunuchs were always very dear; the practice of emasculating boys was borrowed by the Romans from the Asiatics, among whom it was a trade as early as the time of Herodotus (viii. 105): it continued to the time of Domitian, who forbade it; but eunuchs continued to be imported from the East. A 'morio,' or fool, was sometimes sold for 20,000 nummi, or about 160 pounds. Dwarfs and giants were also in great request. Marc Antony paid for a pair of handsome youths 200 sestertia, or 1600 pounds. Martial (*Ep.*, iii. 62) mentions a single handsome youth who cost as much as these two. Actors and actresses and dancers sold very dear, as well as females of great personal attractions, who were likely to bring in great gains to their owners by prostitution. A good cook was valued at four talents, or 772 pounds. Medical men, grammarians, amanuenses, anagnostæ or readers, and shorthand-writers, were in considerable request. With regard to ordinary slaves, the price varied from fifty to twenty pounds, according to their abilities and other circumstances. The lowest legal valuation of a man slave in the time of Justinian was twenty solidi, or about sixteen pounds; and the value seems to have been about the same in the time of Horace (*Sat.*, ii. 7; v. 43). After a victorious campaign, when thousands of captives were sold at once on the spot for the purpose of prize-money, to the slave-dealers who followed the armies, the price sunk very low. Thus in the camp of Lucullus in Pontus slaves were sold for four drachmæ, or two shillings and sevenpence, a head; but the same slaves, if brought to the Roman market, fetched a much higher price. Home-born slaves, distinguished by the name of 'vernæ,' in contradistinction to 'servi empti,' or 'emptitii,' or imported slaves, were generally treated with greater indulgence by their masters in whose families they had been brought up; and for that very reason, when taken to market, bore an inferior value to the imported slaves, being considered as spoilt and troublesome. The number of slaves born in Roman families appears at all times to have been far inferior to that of the imported slaves. In general the propagation of slaves was not much encouraged by masters, many of whom considered slaves born at home to cost more than those who were imported. Ordinary female slaves were inferior in numbers to the males, and were generally cheaper in the market.

There was a brisk trade in slaves carried on from the coasts of Africa, the Euxine, Syria, and Asia Minor. The island of Delos was at one time a great mart for slaves, who were imported thither by the Cilician pirates (Strabo, p. 668, Casaub.) The Illyrians procured numerous slaves for the Italian market, whom they bought or stole from the barbarous tribes in their neighbourhood. Thrace was the parent country of numerous slaves, and the selling of children by their parents was an ancient practice among the Thracian tribes. (Herod., v. 6.) But the chief supply of slaves was derived from Asia and Africa. In most countries it was customary for indigent parents to sell their children to slave-dealers, and even Roman citizens at times sold themselves or their children through distress. Criminals were also in certain cases condemned to slavery, like the galley-slaves of our own times.

Both law and custom forbade prisoners taken in civil wars, especially in Italy, to be dealt with as slaves; and this was perhaps one reason of the wholesale massacres of captives by Sulla and the Triumviri. In the war between the party of Otho and Vitellius, Antonius, who commanded the army of the latter, having taken Cremona, ordered that none of the captives should be detained, upon which the soldiers began to kill those who were not privately ransomed by their friends.

In the latter period of the empire free-born persons of low condition were glad to secure a subsistence by labour on the estates of the great landowners, to which, after a continued residence for thirty years, they and their families became bound by a tacit agreement under the name of adscriptitii, or adscripti glebæ, and this was one of the sources of the servitude of the middle ages.

The customary allowance of food for a slave appears to have been four Roman bushels, 'modii,' of corn, usually 'far,' per month for country slaves, and one Roman libra or pound daily for those in town. Salt and oil were occasionally allowed, as well as weak wine. Neither meat nor vegetables formed part of their regular allowance, but they got, according to seasons, fruit, such as figs, olives, apples, pears, &c. (Cato, Columella, and Varro.) Labourers and artisans in the country were shut up at night in a house ('ergastulum'), in which each slave appears to have had a separate cell. Males were kept apart from females, excepting those whom the master allowed to form 'contubernia' or temporary connections. Columella adverts to some distinction between the ergastulum for ordinary labourers and that for ill behaved slaves, which latter was in fact a prison, often under ground, but generally speaking the ergastula in the later times of the republic and under the empire appear to have been no better than prisons in which freemen were sometimes confined after being kidnapped. The men often worked in chains. The overseers of farms and herdsmen had separate cabins allotted to them. Slaves enjoyed relaxation from toil on certain festivities, such as the Saturnalia. [Saturnalia.]

Every individual master had the power of manumitting his slave, and this he could effect in several forms, by Vindicta, Census, or by Testamentum. All slaves manumitted by a Roman citizen (subject to the conditions above mentioned) became Roman citizens and members of his gens, of which they took the name. They laboured however under several disabilities. They were enrolled in the lowest of the city tribes; they were ineligible to the consulship and other high offices; and they were not generally admitted into the best society. [Libertinus.]

The number of slaves possessed by the wealthy Romans was enormous. Some individuals are said to have possessed 10,000 slaves. Scaurus possessed above 4000 domestic and as many rustic slaves. In the reign of Augustus, a freedman who had sustained great losses during the civil wars left 4116 slaves, besides other property.

The Lex Aelia Sentia, as already mentioned, laid various restrictions on manumission. Among other things it prevented persons under twenty years of age from manumitting a slave except by the Vindicta, and with the approbation of the Consilium, which at Rome consisted of five senators and five Roman equites of legal age (puberes), and in the provinces consisted of twenty recuperatores, who were Roman citizens. (Gaius, i. 20, 38.) The Lex Aelia Sentia also made all manumissions void which were effected to cheat creditors or defraud patrons of their rights. The Lex Furia Caninia, which was passed about A.D. 7, limited the whole number of slaves who could be manumitted by testament to 100, and when a man had fewer than 500 slaves, it determined by a scale the number that he could manumit. This Lex only applied to manumission by testament. (Gaius, i. 42, &c.)

In the earlier ages of the Republic, slaves were not very numerous, and were chiefly employed in household offices or as operatives in the towns; and they were generally treated like members of the family, and joined their masters in offering prayers and sacrifices to the gods. (Horace, *Epist.*, ii. 1, 142.) But after the conquests of Rome spread beyond the limits of Italy, the influx of captives was so great, and their price fell so low, that they were looked upon as a cheap and easily renewed commodity, and treated as such. The condition of the Roman slave, generally speaking, became worse in the later ages of the republic than that of the slave at Athens. It is worthy of remark that many of the emperors, even some of the worst of them, interfered on behalf of the slave. Augustus established courts for the trial of slaves who were charged with serious offences, intending thus to supersede arbitrary punishment by the masters, but the law was not made obligatory upon the latter to bring their slaves before the courts, and was often evaded. The same emperor strongly reprobated Vedius Pollio, a Roman knight, for sentencing a slave to be thrown alive into a fish-pond to be devoured by lampreys, and he took the slave into his own household. By a law passed in the time of Claudius, a master who exposed his sick or infirm slaves forfeited all right over them in the event of their recovery. The Lex Petronia, probably passed in the time of Augustus, or in the reign of Nero, prohibited masters from compelling their slaves to fight with wild beasts, except with the consent of the judicial authorities, and on a sufficient case being made out against the slave. Domitian forbade the mutilation of slaves. Hadrian suppressed the ergastula, or private prisons for the confinement of slaves; he also restrained proprietors from selling their slaves to keepers of gladiators, or to brothel-keepers, except as a punishment, in which case the sanction of a judge (judex) was required. The same emperor banished a lady of rank for five years on account of her cruelty to her slaves. Antoninus Pius adopted an old law of the Athenians, by which the judge who should be satisfied of a slave being cruelly treated by his owner, had power to oblige the owner to sell him to some other person. The judge however was left entirely to his own discretion in determining what measure of harshness on the part of the owner should be a proper ground for judicial interposition. Septimius Severus forbade the forcible subjection of slaves to prostitution. The Christian emperors went further in protecting the persons of slaves. Constantine placed the wilful murder of a slave on a level with that of a freeman; and Justinian confirmed this law, including within its provisions cases of slaves who died under excessive punishment. Constantine made also two laws, both nearly in the same words, to prevent the forcible separation of the members of servile families by sale or partition of property. One of the laws, dated A.D. 334, was retained by Justinian in his code. The Church also powerfully interfered for the protection of slaves, by threatening excommunication against owners who put to death their slaves without the consent of the judge; and by affording asylum within sacred precincts to slaves from the anger of unmerciful masters. A law of Theodosius I. authorized a slave who had taken refuge in a church to call for the protection of the judge, that he might proceed unmolested to his tribunal in order that his case might be investigated. After Christianity became the predominant religion in the Roman world, it exercised in various ways a beneficial influence upon the condition of the slaves, without however interfering, at least for centuries, with the institution of slavery itself. Even the laws of the Christian emperors abolishing the master's power of life and death over his slaves were long evaded. Salvianus (*De Gubernatione Dei*, iv.) informs us that in the provinces of Gaul, [illegible] century, masters still fancied that they had a right to put their slaves to death. Macrobius (*Saturn.*, i. 11) makes one of his interlocutors, though a heathen, expatiate with great eloquence on the cruel and unjust treatment of slaves. In Spain, in the early period of the Visigothic kings, the practice of putting slaves to death still existed, for in the 'Foro Judicum' (b. vi., tit. 5) it is said that as some cruel masters in the impetuosity of their pride put to death their slaves without reason, it is enacted that a public and regular trial shall take place previous to their condemnation. Several laws and ecclesiastical canons forbade the sale of Christians as slaves to Jews or Saracens and other unbelievers.

The northern tribes which invaded the Western empire had their own slaves, who were chiefly Slavonian captives, distinct from the slaves of the Romans or conquered inhabitants. In course of time however the various classes of slaves merged into one class, that of the 'adscripti glebæ,' or serfs of the middle ages, and the institution of Roman slavery in its unmitigated form became obliterated. The precise period of this change cannot be fixed; it took place at various times in different countries. Slaves were exported from Britain to the Continent in the Saxon period, and the young English slaves whom pope Gregory I. saw in the market at Rome were probably brought thither by slave-dealers. Giraldus Cambrensis, William of Malmsbury, and others accuse the Anglo-Saxons of selling their female servants and even their children to strangers, and especially to the Irish, and the practice continued even after the Norman conquest. In the canons of a council held at London, A.D. 1102, it is said, 'Let no one from henceforth presume to carry on that wicked traffic by which men in England have been hitherto sold like brute animals.' (Wilkin's *Concilia*, i., p. 383.)

But although the traffic in slaves ceased among the Christian nations of Europe, it continued to be carried on by the Venetians across the Mediterranean in the age of the Crusades. The Venetians supplied the markets of the Saracens with slaves purchased from the Slavonian tribes which bordered on the Adriatic. Besides, as personal slavery and the traffic in slaves continued in all Mohammedan countries, Christian captives taken by Mussulmans were sold in the markets of Asia and Northern Africa, and have continued to be sold till within our own times, when Christian slavery has been abolished in Barbary, Egypt, and the Ottoman empire, by the interference of the Christian powers, the emancipation of Greece, and the conquest of Algiers by the French.

With the discovery of America, a new description of slavery and slave-trade arose. Christian nations purchased heathen negroes for the purpose of employing them in the mines and plantations of the New World. It was found by experience that the natives of America were too weak and too indolent to undergo the hard work which their Spanish task-masters exacted of them, and that they died in great numbers. Las Casas, a Dominican, advocated with a persevering energy before the court of Spain the cause of the American aborigines, and reprobated the system of the 'repartimientos,' by which they were distributed in lots like cattle among their new masters. [CASAS, BARTHOLOMÉ DE LAS.] But it was necessary for the settlements to be made profitable in order to satisfy the conquerors, and it was suggested that negroes from Africa, a more robust and active race than the American Indians, might be substituted for them. It was stated than an able-bodied negro could do as much work as four Indians. The Portuguese were at that time possessed of a great part of the coast of Africa, where they easily obtained by force or barter a considerable number of slaves. The trade in slaves among the nations of Africa had existed from time immemorial. It had been carried on in antient times: the Garamantes used to supply the slave-dealers of Carthage, Cyrene, and Egypt with black slaves which they brought from the interior. The demand for slaves by the Portuguese in the Atlantic harbours gave the trade a fresh direction. The petty chiefs of the interior made predatory incursions into each other's territories, and sold their captives, and sometimes their own subjects, to the European traders. The first negroes were imported by the Portuguese from Africa to the West Indies in 1503, and in 1511 Ferdinand the Catholic allowed a larger importation. These however were private and partial speculations; it is said that Cardinal Ximenes was opposed to the trade because he considered it unjust. Charles V. however, being pressed on one side by the demand for labour in the American settlements, and on the other by Las Casas and others who pleaded the cause of the Indian natives, granted to one of his Flemish courtiers the exclusive privilege of importing 1000 blacks to the West Indies.

The Fleming sold his privilege for 25,000 ducats to some Genoese merchants, who organised a regular slave-trade between Africa and America. As the European settlements n America increased and extended, the demand for slaves also increased; and all European nations who had colonies n America shared in the slave-trade. The details of that rade, the sufferings of the slaves in their journey from the nterior to the coast, and afterwards in their passage across he Atlantic—their treatment in America, which varied not only according to the disposition of their individual masters, but also according to different colonies, are matters of notoriety which have been amply discussed in every country of Europe during the last and present centuries. It is generally understood that the slaves of the Spaniards, especially in Continental America, were the best treated of all. But the negro slaves in general were exactly in the ame condition as the Roman slaves of old, being saleable, transferable, pawnable, and punishable at the will of heir owners. Restrictions however were gradually introduced by the law of the respective states, in order to protect he life of the negro slave against the caprice or brutality of his owner. In the British colonies, especially in the latter part of the last century and the beginning of the present, much was done by the legislature; courts were established o hear the complaints of the slaves, flogging of females was forbidden, the punishment of males was also limited within certain bounds, and the condition of the slave population was greatly ameliorated. Still the advocates of emancipation objected to the principle of slavery as being unjust and unchristian; and they also appealed to experience to show hat a human being cannot be safely trusted solely to the mercy of another.

But long before they attempted to emancipate the slaves, he efforts of philanthropists were directed to abolish the slave traffic, which desolated Africa, wholly prevented the advance in civilization, and encouraged the maltreatment of the negroes in the colonies, by affording an unlimited supply, and making it not the planter's interest to keep up his stock in the natural way. The attention of mankind was first effectually awakened to the horrors of this trade by Thomas Clarkson. His labours, with the aid of the zealous men, chiefly Quakers, who early joined him, prepared the way for Mr. Wilberforce, who brought the subject before parliament in 1788, and although, after his notice, the motion, owing to his accidental illness, was first brought forward by Mr. Pitt, Mr. Wilberforce was throughout the great parliamentary leader in the cause, powerfully supported in the country by Thomas Clarkson and others, as Richard Phillips, George Harrison, William Allen, all of the Society of Friends, Mr. Stephen, who had been in the West Indies as a barrister, and Mr. Z. Macaulay, who had been governor of Sierra Leone, and had also resided in Jamaica. A bill was first carried (brought in by Sir W. Dolben) to regulate the trade until it could be abolished, and this in some degree diminished the horrors of the middle passage. But the question of abolition was repeatedly defeated, until 1804, when Mr. Wilberforce first carried the bill through the Commons; it was thrown out in the Lords, and next year it was again lost even in the Commons. Meanwhile the capture of the foreign colonies, especially the Dutch, during the war, frightfully increased the amount of he trade, by opening these settlements to British capital; and at one time the whole importation of slaves by British vessels amounted to nearly 60,000 yearly, of which about a third was for the supply of our old colonies. At length, in 1805 an order in council prohibited the slave-trade in the conquered colonies. Next year the administration of Lord Grenville and Mr. Fox carried a bill through, prohibiting British subjects from engaging in the trade for supplying either foreign settlements or the conquered colonies. A resolution moved by Mr. Fox, the last time he took any part in public debate, was also carried in 1806, pledging the Commons to a total abolition of the trade early next session, and this was, on Lord Grenville's motion, adopted by the Lords. Accordingly next year the General Abolition Bill was brought in by Lord Howick (afterwards Earl Grey), and being passed by both houses, received the royal assent on the 25th of March, 1807. This act prohibited slave-trading from and after the 1st of January, 1808; but as it only subjected offenders to pecuniary penalties, it was found that something more was required to put down a traffic the gains of which were so great as to cover all losses by capture. In 1810 the House of Commons, on the motion of Mr. Brougham, passed unanimously a resolution, pledging itself early next session effectually to prevent 'such daring violations of the law;' and he next year carried a bill making slave-trading felony, punishable with fourteen years' transportation, or imprisonment with hard labour. In 1824 the laws relating to the slave-trade were consolidated, and it was further declared to be piracy, and punishable capitally, if committed within the Admiralty jurisdiction. In 1837 this was changed to transportation for life, by the acts diminishing the number of capital punishments. Since the Felony Act of 1811, the British colonies have entirely ceased to have any concern in this traffic. If any British subjects have engaged in it, or any British capital has been embarked in it, the offence has been committed in the foreign trade.

The influence of Great Britain was strenuously exerted at the peace in 1814 and 1815, and afterwards at the congress of Aix-la-Chapelle, to obtain the concurrence of foreign powers in the abolition; and with success thus far, that all of them have passed laws prohibiting the traffic, and all, except the United States of North America, have agreed to the exercise of a mutual right of search, the only effectual means of putting it down. As the United States were the first to abolish the foreign trade by law, having passed their abolition act before ours, and as early as the constitution gave congress the power to do so, it is the more to be lamented that they should still refuse a right of search, which France herself has given, and should thus enable slave-traders to use their flag to a dreadful extent. The Duke of Wellington, while ambassador at Paris in 1814, used every effort to obtain from the restored government a prohibition of the traffic; but the West Indian interest, and commercial jealousy of England, frustrated all his attempts, and Napoleon, during the hundred days, on his return from Elba, first abolished the trade by law. The right of search has been most honourably granted by the revolutionary government of 1830. The History of the Abolition is to be found in the work under that title, by T. Clarkson (edition 1834), and the state of the law, as well as the treatment of slaves practically in the colonies, is most fully treated of in a work on that subject by Mr. Stephen. T. Clarkson's other works on the nature of the traffic, which first exposed it to the people of this country, were published in 1787.

The slave-trade was suppressed, but slavery continued to exist in the colonies. In 1834 the British parliament passed an act by which slavery was abolished in all British colonies, and twenty millions sterling were voted as compensation money to the owners. This act stands prominent in the history of our age. No other nation has imitated the example. Slavery exists in the French, Dutch, Spanish, and Portuguese colonies, and in the southern states of the North American Union. The new republics of Spanish America, generally speaking, emancipated their slaves at the time of the revolution. As the slave population in general does not maintain its numbers by natural increase, and as plantations in America are extended, there is a demand for a fresh annual importation of slaves from Africa, which are taken to Brazil, Cuba, Puerto Rico, Monte Video, and, it is said, clandestinely and circuitously, also to Texas. In a recent work, 'The African Slave-Trade and its Remedy,' by Sir T. Fowell Buxton (who, after Mr. Wilberforce's retirement, took a most active part in parliament on the subject of slavery), it is calculated, apparently on sufficient data, that not less than 150,000 negro slaves are annually imported from Africa into the above-mentioned countries, in contravention to the laws and the treaties existing between Great Britain and Spain and Portugal, the local authorities either winking at the practice or being unable to prevent it. But another appalling fact is, that since the slave-trade has been declared to be illegal, the sufferings of the slaves on their passage across the Atlantic have been greatly increased, owing to its being necessary for masters of slave-traders to conceal their cargoes by cooping up the negroes in a small compass, and avoiding the British cruizers; they are often thrown overboard in a chase. There is a considerable loss of life incident to the seizing of slaves by force in the hunting excursions after negroes, and in the wars between the chieftains of the interior for the purpose of making captives. There is a loss on their march to the sea-coast: the loss in the middle passage is reckoned on an average at one-fourth of the cargo; and, besides this, there is a further loss, after landing, in what is called the 'seasoning' of the slaves. At present the Portuguese and Brazilian flags are openly used, with the connivance of the authorities, for carrying on the slave-trade. The Spanish flag is also used, though less openly, and with greater caution, owing to the treaty between England and Spain which formally abolishes the slave-trade on the part of Spain. A mixed commission court of Spaniards and British exists at Havana to try slavers; but pretexts are never wanting to elude the provisions of the treaty. There seems indeed to be a great difficulty in obtaining the sincere co-operation of all the Christian powers to put down the slave-trade effectually, although it is certain that in all but the Portuguese and Spanish settlements the traffic has now almost entirely ceased.

Besides the slave-trade on the Atlantic, there is another periodical exportation of slaves by caravans from Soudan to the Barbary states and Egypt, the annual number of which is variously estimated at between twenty and thirty thousand. There is also a trade carried on by the subjects of the Imam of Muscat, who export slaves in Arab vessels from Zanzebar and other ports of the eastern coast of Africa, to Arabia, Persia, India, Java, and other places. In a despatch, dated Zanzebar, May, 1839, Captain Cogan estimates the slaves annually sold in that market to be no less than 50,000. The Portuguese also export slaves from their settlement on the Mozambique coast, to Goa, Diu, and their other Indian possessions.

By a law of the Korán, which however is not always observed in all Mohammedan countries, no Mussulman is allowed to enslave one of his own faith. The Moslem negro kingdoms of Soudan supply the slave-trade at the expense of their pagan subjects or neighbours, whom they sell to the Moorish traders. There is no likelihood that Mohammedan powers will ever suppress this trade of their own accord.

There is also a considerable internal slave-trade in the United States of North America. Negroes are purchased in Maryland and Virginia, and some other of the slave-holding states, and carried to the more fertile lands of Alabama, Louisiana, and other southern states.

It is maintained by some that the African slave-trade cannot be effectually put down by force, and that the only chance of its ultimate suppression is by civilizing central Africa, by encouraging agricultural industry and legitimate branches of commerce, and at the same time spreading education and Christianity; and also by giving the protection of the British flag to those negroes who would avail themselves of it. It is certain that if other countries will not exert themselves to enforce these laws, the abolition must be postponed to this remote period. The Africans sell men because they have no other means of procuring European commodities, and there seems no doubt that one result of the slave-trade is to keep central Africa in a state of barbarism. We refer for evidence of this, and of the nature of the traffic generally, to the numerous authorities quoted in Sir T. Buxton's book, and to the works of T. Clarkson, and Messrs. Wilberforce, J. Stephen, Brougham, and Macaulay.

The amount of the slave population now existing in America is not easily ascertained. By the census of 1835 Brazil contained 2,100,000 slaves. The slaves in Cuba, in 1826, were, according to Humboldt, about 260,000. In the United States, in 1830, the number of slaves was a little more than two millions. For more precise details we refer to the separate heads of each state, CAROLINA, GEORGIA, VIRGINIA, &c.

Societies for the ultimate and universal abolition of slavery exist in England, France, and the United States, and they publish their Reports; and a congress was held in London, June, 1840, of delegates from many countries to confer upon the means of effecting it. The American Society has formed a colony called Liberia, near Cape Mesurado, on the west coast of Africa, where negroes who have obtained their freedom in the United States are sent, if they are willing to go. The English government has a colony for a similar purpose at Sierra Leone, where negroes who have been seized on board slavers by English cruizers are settled. [SIERRA LEONE.]

SLAVONIA is a province of the Austrian dominions, which, though incorporated with the kingdom of Hungary, is still styled in official documents the kingdom of Slavonia. It is situated between 44° 50′ and 46° 12′ N. lat., and between 17° and 20° 40′ E. long. It is bounded on the west by Croatia, on the north and east by Hungary, and on the south by Turkey. It is separated from Hungary by the Drave and the Danube, from Turkey by the Save, and has the Ilowa on part of the western frontier. It consists of two parts, the province of Slavonia, and the Slavonian part of the Military Frontier. The area of the whole is 6600 sq. miles, and the population is 598,800. The province has an area of 3570 square miles, divided into the three counties of Posega, Veröez, and Sirmium, with 348,000 inhabitants. A chain of high mountains coming from Croatia traverses the province. Where this chain enters the province the valleys are narrow, but they gradually become more open towards the middle of the province, and form near Posega a wide plain bounded by lofty mountains, which is called the Posega Valley; but at the eastern frontier of this county, the branches of the mountains again join in one principal chain, which covers all the northern part of the county of Sirmium. This chain is covered with vast forests. The highest points are 2800 feet above the surface of the three principal rivers. The remaining part of Slavonia consists partly of fertile eminences planted with vines and fruit-trees, and partly of beautiful and extensive plains. But as many tracts of land on the Save and Drave are very low, they are subject to be frequently overflowed, and there are several large and small pieces of stagnant water, and extensive marshes. Many of these are presumed to have been formed through neglect, and some have already been drained and cultivated. The country produces corn of all kinds, hemp, flax, tobacco, and great quantities of liquorice. There are whole forests of plum-trees: chesnut, almond, and fig-trees are likewise found, and the white mulberry abounds. Slavonia is rich in useful domestic animals. The horses are of a small race, and sheep are not numerous. Of wild animals, the bear, wolf, fox, pole-cat, and vulture are common. Swarms of troublesome insects are bred in the marshes, and a long continuance of southerly winds sometimes brings locusts from Turkey. The only minerals of which there are considerable quantities are sulphur, limestone, coal, salt, and iron. It may be said that there are no manufactures in Slavonia. The peasant makes all his farming implements—his cart, his plough, &c., and his wife and daughters weave the cloth and knit the stockings for the family. The anonymous author of the 'Geographical and Statistical Description of Hungary, Croatia, and Slavonia,' says that wheat yields 20-fold and sometimes 30-fold, and that one grain of maize yields 2000. In so fertile a country agriculture and the breeding of cattle are the most profitable occupations of the inhabitants. The culture of silk is flourishing. The quantity of wine produced is very large, especially in the county of Sirmium, where the vine was planted in the third century by the soldiers of the emperor Probus: about 560,000 eimer (the eimer is 10 gallons) are produced in one year in that county. The wines, both red and white, are very fiery, but will not keep long, and are therefore not fit for exportation. The export trade is confined almost entirely to the natural productions of the soil, such as corn, swine, and oxen to Austria; tobacco to Italy, France, and Belgium; spirits, distilled from plums, to Hungary, Turkey, and Germany; silk to Ofen; honey, wax, liquorice, gall-nuts, and raw hides to Austria and Italy; pipe-staves and wooden hoops are sent to Hungary; some salt and oil are also exported; and Peterwardein has a considerable trade in fruit.

Religion and Education.—The inhabitants are Roman Catholics and Non-united Greeks; the latter are the most numerous, in the proportion of about five to three. Till 1827, the law excluded Protestants from Slavonia, though it made an exception in favour of those who were settled in the country in 1791. There are now two flourishing Protestant communities in Old and New Panza, consisting of about 3500 persons; and a few Jews, mostly in Peterwardein, and about 300 in Semlin. There are about 30 Roman Catholic schools in the province, and as many in the Military Frontier; and two Roman Catholic gymnasia at Essek and Posega. The Non-united Greeks have an archbishop at Carlowitz, where there is a flourishing lyceum. There is likewise a clerical school at Carlowitz, and another at Pakratz. In the archbishopric there are above 260 national schools.

The earliest known inhabitants of Slavonia were the Scordisci; it was afterwards inhabited by the Pannonians, who were subdued by Augustus. The country was afterwards part of Pannonia Inferior, and was called Pannonia Savia. The emperor Probus, who was a native of Sirmium, did much to improve the cultivation of the country, and caused the first vines to be planted in the year 276. Subsequently, several portions of Slavonia were detached from the Byzantine empire; but Sirmium continued to belong to it, even when the whole country was a prey to the Avari. When the Avari were overpowered, in 796, by Pepin, the father of Charlemagne, the greater part of Pannonia Savia was a desert, and Charlemagne afterwards allowed a Slavonian tribe living in Dalmatia to settle in it. The first settlers were soon followed by others, and the Slavi (or Slavonians) soon became a numerous people, who in the time of the emperor Louis the Pious had their own prince, named Liudewit, subject however to the Franks. In 827 the Bulgarians invaded the country, but were repulsed by the Franks. The Slavonians had indeed been partially converted to Christianity on their first settling, but as they fell into gross ignorance for want of instruction, two brothers, Cyrillus and Methodius, went in 864 to visit the Slavonian tribes in the east, and to instruct them. In the tenth century, the Magyars, having conquered all Pannonia, afterwards subdued Slavonia also; Sirmium however still remained subject to the Byzantine empire, but by degrees became independent, and had its own princes. In 1019 it was again, for a short time, subject to Byzantium, and continued for many years the theatre of war between the Byzantines and the Hungarians; the latter ultimately got possession of it till it was finally ceded to the Hungarians in 1165. In 1471 the Turks invaded Slavonia for the first time. In 1524 the whole country was conquered by the Turks, to whom the counties of Valpo, Posega, Veröcz, and Sirmium were ceded in 1562, and erected by them into a distinct pashalik. It was recovered by the emperor Leopold I., and after having been for a long time the theatre of war, was ceded to Austria by the treaty of Carlowitz in 1699. The country having become almost a desert while under the Turks, numbers of Illyrians were settled in it. In 1690 and the following years the country was placed under a military administration; the inhabitants were exempted from taxes, but were bound to arm themselves, and be always ready for the defence of the country. This military administration was abolished in 1745, but in later times it has been again introduced under a better form, which is chiefly confined to the tract along the Turkish frontier.

The Slavonian Military Frontier (including what is called the district of the Czaikist Battalion, between the Danube and the Theiss) has an area of 3030 square miles and 330,000 inhabitants, and is divided into the three regimental districts of Peterwardein, Brod, and Gradiska, and the Czaikist district. [ESSEK; MILITARY FRONTIER; PETERWARDEIN; SYRMIA.]

(*Oesterreichische National Encyclopädie*; *Statistisch-Geographische Beschreibung des Königreichs Ungarn, Croatien, und Slavonien*; Stein; Hassel; Hörschelmann.)

SLAVONIANS. The Slavonian or Slavic race, which now extends from the Elbe to the Pacific, and from the northern ocean to the frontiers of China, Persia, and the Mediterranean, comprehends about 70,000,000 inhabitants, divided into several nations, who speak various cognate dialects, and live within the dominions of Russia, Austria, Turkey, Prussia, and Saxony. The name 'Slavonian' is deduced from the word *slava*, 'glory,' or *slovo*, 'word.' The advocates of the first etymology support it by referring to the usual termination of Slavonian names in *slav*, such as *Stanislav*, 'establisher of glory;' *Vladislav*, 'ruler of glory;' and *Yaroslav*, 'famous for glory.' Others maintain that the name of Slavonians, which is often written *Slovenie* instead of *Slavenie*, is derived from *slovo*, 'word,' and that the Slavonians being unable to understand the language of the nations with whom they came into contact, called them *Niemetz*, that is, 'mute,' an appellation which is given to the Germans in all the Slavonian dialects, whilst they called themselves *Slovenie*, that is, 'men endowed with the gift of the word.' The Byzantine writers changed the appellation of Slavonians into Sclabos or Sclav (Σκλαβηνοί, Procopius); and hence the appellation of Sclavonians, adopted by the western authors.

According to Jornandes, the first writer who mentions the Slavonians, they were formerly called Venedi; and Pliny (iv. 13) says that they lived about the banks of the Vistula. Ptolemy places them on the eastern shore of the Baltic, which he calls the Venedian Gulf. This is the oldest account that we have about the country inhabited by the Slavonians; but whence and when they came to these parts is unknown. Jornandes gives the following account of them:—'Dacia is secured by Alps (i.e. Carpathian), on whose left side, which from the source of the Vistula runs to the north through an immense extent, the nation of the Winidi have their settlements. Although their names vary in various tribes and places, they call themselves Slavonians and Antæ.' Jornandes also says that this nation was conquered, A.D. 376, by Hermanaric, king of the Goths; and he says in another place, 'These, as we have said, proceed from the same blood, and have three names, Venedi, Antæ, and Slavonians, who for our sins are now ravaging everywhere' (*i.e.* in the Roman empire).

The evidence of Jornandes proves that the Venedi, Antæ, and Sclavini or Slavonians were the same race, although they may have formed separate tribes or nations, as the Bohemians, Poles, and Russians of our days; and we may add that the Slavonians of Lusatia and Saxony are even now called Vendes by the Germans.

The Slavonians appeared on the borders of the empire about A.D. 527, and having invaded the Greek provinces committed terrible ravages. The Imperial legions were defeated by them, and the wall erected by the emperor Anastasius to arrest the savage tribes of the north was forced by the Slavonians, who devastated all the country from the Ionian Sea to the walls of Constantinople. They besieged the capital itself, and nobody dared to encounter them. Belisarius at last succeeded, more by presents than force, in removing this dangerous enemy from Constantinople. After that time they settled on the banks of the Danube, alternately ravaging the provinces of the empire or serving in its armies. The Slavonians were conquered in the sixth century by the Avari, with the exception of those who were settled on the Danube, and who, in the year 581, invaded the empire. The emperor Tiberius, who was occupied at that time with the Persian war, was unable to repel the Slavonians, and he induced the Khan of the Avari to attack them. The power of the Slavonians was destroyed, and they were obliged to submit to the Khan. After that time they served in the wars of their new master, and the Greeks experienced their desperate valour when the Avari besieged Constantinople in 626, on which occasion the Slavonians nearly carried the town.

The Slavonians who inhabited the vicinity of the Baltic remained free, while their brethren of the south were under the yoke of the Avari. This yoke was at last broken by the Slavonians of Bohemia, who rose against their oppressors, and defeated them under the command of a chieftain called Samo, who was chosen king by his grateful countrymen. The emancipation of the Slavonians from the dominion of the Avari was followed by an extension of their possessions. In the seventh century, having concluded an alliance with the emperors of Constantinople, they entered Illyria, and after having expelled the Avari, they founded new colonies under the name of Slavonia, Croatia, Servia, Bosnia, and Dalmatia. The Greek emperors favoured their settling in the Imperial provinces. In the seventh century there were Slavonian settlements on the river Strymon in Thrace, in the vicinity of Thessalonica, and in Mœsia, or the modern Bulgaria. Many of them settled in the Peloponnesus, and a considerable number passed into Asia and settled in Bithynia and other provinces.*

From this time the Slavonians are no longer historically known under that general appellation, but they continued to take a prominent part in political affairs under the various denominations by which the nations belonging to that race are distinguished, as Poles, Russians, Bohemians, &c.

The customs, religion, and language of the Slavonian race are still characterised by a family likeness, which is preserved in the numerous nations which have sprung from the same stock, notwithstanding the modifications produced in the respective nations by local circumstances and historical events.

Procopius (*De Bello Goth.*, iii.) gives the following account of the Slavonians: 'The nations of the Slavonians and Antæ do not obey a single master, but live under a democratical government; therefore the gains and losses are common amongst them, and all other things go in the same way. They acknowledge as god and as the lord of all their nation the maker of the thunder, to whom they offer oxen and other sacrifices of every kind. They do not acknowledge fate, and do not even admit its influence on mortal men; and when they apprehend, in sickness or trouble, a speedy death, they vow to God some bloody sacrifice for their health or safety; and believe, when they come out of danger, that they did so in consequence of their vow. They worship also river-nymphs and some other divinities, to whom they offer sacrifices, making at the same time divinations. They live in miserable huts, standing isolated, and they change their settlements. In a battle many of them fight on foot, armed only with a small target and a lance. They do not wear any armour, and they have not even a shirt or a cloak; but they encounter the enemy only in breeches covering the secret parts. They all speak the same very barbarous language, and do not differ much in their exterior. Their complexion is not very white, and their hair is neither fair nor black, but dark. They lead, like the Massagetæ, a rude and wandering life, and they are always dirty. Their mind is neither malicious nor fraudulent, and they preserve, with the simplicity, the manners of the Huns in many things. Formerly the Slavonians and Antæ had the same name; both were called Spori, probably because they live in a scattered manner (sporaden) in isolated huts, and they occupy for that reason a large extent of country. They possess the greatest part of the farther banks of the Danube. According to some they feed their flocks wandering about.'

---

* At the same time Christianity began to spread among them. The sixth synod of Constantinople (A.D. 680) enumerates the Slavonians among the Christian nations.

This description shows that the Slavonians then lived in a state of barbarism. They were inured to every kind of fatigue and privation, and accustomed to all the expedients of a savage warfare. These qualities made them formidable enemies and invaluable allies to the Greeks. They were rapacious, like all savage tribes, but the cruelty with which they were taxed may be partly ascribed to the provocation of the Greeks, who frequently treated their vanquished enemies with great barbarity. But the Slavonians exhibited, notwithstanding their state of barbarism, virtues of the noblest kind, and a mildness of character unparalleled even among the civilised nations of that time. According to the emperor Mauritius, they treated their prisoners with great humanity, and instead of keeping them in servitude like other nations, they always fixed a limit to it, and gave them the choice of paying a ransom and returning to their country, or remaining with them as freemen and friends. A stranger was welcome among them, and hospitably entertained. The houseowner was answerable to all his nation for the safety of the stranger whom he had received; and he who had not preserved his guest from injury drew upon himself the vengeance of his neighbours.

The matrimonial fidelity of the Slavonian wives and husbands is extolled by foreign authors. The wives were complete slaves, as is generally the case amongst uncivilised nations: the widow was burnt on the same pile with her deceased husband, as it was disgraceful to survive him. It is also said that a Slavonian father might destroy a female child, when he was already overcharged with a large family, but he might not put a male child to death; and that the children might put their parents to death, when from old age and infirmity they were a burthen to them. Their chief occupation was agriculture. They seem to have possessed some knowledge of the arts, and they were exceedingly fond of music. The most antient musical instrument of the Slavonians is a kind of lyre called *gusla*, which is still preserved among some nations of their race.

Although the Slavonians who appeared on the borders of the Greek empire were rude and uncivilised, those who lived on the southern shores of the Baltic had towns and enjoyed the advantages of a considerable commerce. Their chief cities were Arcona, on the island of Rügen, which contained the most celebrated fane of their worship, and Vineta, at the mouth of the river Oder. Adam of Bremen, who wrote in 1067, and Helmold, state that all the Slavonians were idolaters, but that no nation was more hospitable and honest than they; that the original form of government was democratical, that the fathers of families had great authority over their wives and children, and that they met together occasionally to consult on the affairs of their community. With the progress of time, and probably also from the necessities created by their coming into contact with more civilised nations, the Slavonians introduced permanent authorities and chiefs. Aristocracies were formed, either by military leaders, or by the more wealthy and cunning persons, who succeeded in establishing an hereditary influence. Many Slavonian communities came under the rule of hereditary chiefs or sovereigns; others elected their chiefs for life; whilst many retained their primitive democratic form, somewhat modified by circumstances. The Slavonian chiefs were called Kral or Krol, which signifies king. Kniaz or Knez, is now employed for prince; Boyar, a warrior, from Boy, fight; Lekh, or noble; Voyevoda, *i.e.* leader of war, perhaps a more modern translation from the Saxon heretog, or German herzog; Pan, in Polish, lord; Zupan, the chief of a district, Zupa. All these dignities, whether hereditary or elective, by no means implied absolute authority, and the persons holding them were always subject to the popular will, which decided on public affairs in the assemblies, which were held in the open air, and called *Viecha* or *Vieche*, probably from the Slavonian word *vieshchat*, 'to proclaim.'

The religion of the antient Slavonians seems to have been different from that of the Teutonic nations. The latest account of the Slavonian idols and pagan rites is given by the German missionaries, who had an opportunity of observing the Slavonians of the Baltic coast, or at least derived information on that subject from eye-witnesses, as well as by some Scandinavian authors.

According to the above-mentioned authors, the Slavonians of the Baltic acknowledged two principles, one of good, and the other of evil. They called the former Biel Bog, or the 'white god,' from whom all that was good proceeded; and the second Cherni Bog, or 'black god,' who was the cause of all evil. This latter was represented in the form of a lion. The most celebrated Slavonian idol, whose temple was at Arcona, was Sviatovid, that is, 'holy sight.' He was held in great veneration by the Slavonians, and even the kings of Denmark, who then professed Christianity, frequently sent him offerings. This idol represented a man larger than life, dressed in a short garment made of many-coloured wood. He had two chests and four heads. He stood with his feet on the ground, held in one hand a bow, and in the other a horn, which was filled once every year on a solemn occasion with mead. Near the idol were placed, as belonging to him, a bridle and saddle, and a sword richly ornamented with silver. His festival was celebrated on a certain day after harvest, when the priest brought out to the assembled multitude the horn which the idol held in his hand, and from the decrease of the liquid poured into it the year before the result of the next harvest was prognosticated. The mead of the last year was poured at the idol's feet, and his horn was replenished, with appropriate ceremonies and prayers. The remainder of the day was spent in feasting; abstemiousness on that day was considered sinful, and the greatest excess in drinking and eating was accounted an act of devotion.

The Slavonians paid a tax to the temple of the idol, and gave him the third part of their booty. There were also three hundred horsemen belonging to the idol, who deposited in his temple all the spoils that they made. These different donations were employed to ornament the temple, or deposited in the treasury, which contained a great number of chests filled with coin, rich stuffs, and other precious things. There was a white horse consecrated to the same idol, which was led and mounted only by the priest. The Slavonians believed that Sviatovid occasionally rode upon this horse, in order to combat the enemies of their faith; and its moving with the right or left foot over lances placed on the ground, decided the most important undertakings. The temple of Sviatovid was destroyed in the twelfth century by Waldemar, king of Denmark. Some German chroniclers believe that Sviatovid was the same as St. Vitus, whom the Slavonians had adopted after having heard of his great miracles; but this is evidently an error founded on the similarity of names.*

There were also several other divinities worshipped by the Slavonian idolaters, such as Porenut, whose idol had four faces, and a fifth on his breast, supposed to have been the god of seasons, from the word *pora*, 'season;' Porevit, represented with five hands; Rughevit, supposed to be the god of war, whose idol had seven faces, seven swords suspended at his side, and an eighth in his hand. All these three were in the island of Rügen, the last asylum of Slavonian idolatry.

This account of the Slavonian deities is founded, as already observed, on the report of writers who had either seen the idols or derived their information from hearsay. The only genuine monuments of Slavonian idolatry which have reached our times are the idols dug up about the end of the seventeenth century in the village of Prillwitz, on the banks of the lake Tollenz, in the territory of Mecklenburg. This village is supposed to occupy the site of the Slavonian town of Retra, which was destroyed by the Saxons in the middle of the twelfth century, and was celebrated in its time for its temples and idols. These archæological treasures remained unknown to the learned world till 1771, when Mr. Masch, chaplain of the duke of Mecklenburg, published a description of them with engravings. These antiquities were found in two metal vessels, supposed to have served for sacrifices, and which were so placed that one formed a cover to the other: they had engraved on them several inscriptions, but unfortunately they were both melted for the casting of a bell before they were examined by any person competent to judge of the inscriptions. The contents of these vessels were not only idols, but also several objects employed in the performance of sacrifices. They are all of brass, with more or less admixture of silver. The greatest part of them have inscriptions in Runic characters: one of them however, exhibiting the attributes of autumn, has the Greek inscription ΟΠΩΡΑ. The greater part of these idols have Slavonian names, such as Radegast, Cherni Bog, Zibag, &c. (Bog in Slavonian signifies God); several of them however have Lithuanian names, and must belong to the Lithuanian and Prussian idolaters, who probably sought refuge among the Slavonians from their common enemies the Christians. Both Slavonian and Lithuanian idols correspond to the descriptions given of them by the old chroniclers. The Slavonian divinities usually have more than one head: many of them have on some part of their body either a human face, signifying the good principle, or a lion's head, denoting the evil principle. Many have also the figure of a beetle on them, which might denote an Egyptian origin. They are in general only a few inches long.

---

* The most detailed account of Sviatovid and his worship is given by Saxo Grammaticus.

The chief Slavonian divinities represented by these idols are Radegast, having the head of a lion, surmounted by a bird; Woda, represented as a warrior, perhaps the Scandinavian Odin, &c.

These monuments of Slavonian idolatry present a wide field for investigation, and they prove that the nation with whose religious worship they are connected was not a stranger to the arts. It is difficult to ascertain whether the divinities of Lithuanian and Scandinavian origin, which were foreign to the Slavonians, were adopted by them, or only found an asylum with their worshippers when expelled from their countries by the progress of Christianity.

The eastern Slavonians worshipped Perun, or the god of thunder; Volos, the god of the flocks; Koleda, the god of festivals, whose festival was celebrated on the 24th of December, and it is remarkable that the common people in many parts of Poland and Russia on that account even now call Christmas, Koleda; Kupala, the god of the fruits of the earth, received sacrifices on the 23rd of June, and in many parts of Russia and Poland, St. John, whose festival falls on the same day, is called John Kupala. Dittmar, a German writer, pretends that the pagan Slavonians did not believe in the immortality of the soul; but this statement is sufficiently refuted by several customs and ceremonies which they observed for the repose of the dead.

In the ninth century the Slavonians occupied a large part of Eastern Europe. They extended from the Black Sea along the Danube and to the westward of that river on the shore of the Adriatic, occupying the antient Roman provinces of Pannonia, Dacia, Illyricum, and Dalmatia. The Slavonian settlements reached from the northern part of the Adriatic bordering on the Tyrol and Bavaria to the upper part of the Elbe, and they occupied the country between that river and the Saal, as well as all the right bank of the Elbe, extending over the southern shore of the Baltic from Jutland to the mouths of the Vistula. From the Vistula (with the exception of the coast of the Baltic inhabited by another race) the Slavonians spread over all the country between that river and the Danube. Thus they possessed the countries which now constitute the greater part of the Austrian dominions, Hungary, the provinces bordering on Italy and the Tyrol, Bohemia and Moravia, a great part of Saxony, the March of Brandenburg, Silesia, Pomerania, and the island of Rügen, to which must be added the territory which constituted antient Poland, and a great part of the present Russian empire.

The Slavonian population of Pomerania, Mecklenburg, the island of Rügen, the March of Brandenburg, and of Saxony, on the left bank of the Elbe, was either exterminated or so completely Germanised, that the language of their country is completely superseded by the German: but there are traces of this language being used in official documents in the country about Leipzig as late as the beginning of the fourteenth century. The names of many towns and villages situated in those parts of Germany are evidently of Slavonian origin.

The following are the Slavonian nations now in existence:—

1. The Bohemians and Moravians, who inhabit Bohemia and Moravia, and are scattered in some parts of Hungary and Silesia.
2. The Poles, who inhabit the territory of antient Poland, Silesia, and Prussia.
3. The Muscovites or Great Russians, who have a considerable admixture of Finnish blood, and have become somewhat orientalised by the dominion of the Tartars in Russia. They inhabit the north-eastern provinces of Russia in Europe.
4. The Russians, who are quite distinct from the Great Russians or Muscovites, are divided into Little Russians, who inhabit the antient Polish provinces of the Ukraine, Podolia, and Volhynia, now incorporated with Russia, a part of the kingdom of Poland, Gallicia or Austrian Poland, and some parts of Northern Hungary; and White Russians, who inhabit a part of Lithuania, and chiefly the provinces of Mohilef and Witepsk, which were acquired by Russia at the first dismemberment of Poland, in 1772, as well as a part of the government of Smolensk.
5. The Slovacks, who inhabit the north of Hungary.
6. The Croats, who inhabit the south-west of Hungary.
7. The Illyrians, who inhabit the Austrian provinces of Carinthia, Carniola, and Dalmatia.
8. The Servians, who inhabit Servia, to whom may be added the Montenegrins.
9. The Bulgarians and Bosnians in Turkey, of whom a part have embraced Mohammedanism, while others profess the Christian religion according to the Eastern church.
10. The Syrbes or Wends, who inhabit Lusatia, and whose settlements are about 25 miles from Dresden.

Slavonian Tongue.—It has been observed that Procopius, who described the Slavonians in the fifth century, says that they and the Antæ used the same language, and a similar opinion is expressed about the Slavonians of the eighth century, by Eginhard, the historian of Charlemagne. It is however impossible to admit the perfect universality of the same language among a race composed of so many tribes, and occupying such a vast extent of country. The evidence of the writers above mentioned, who have not transmitted to us any monument of the Slavonian language, and probably did not understand it, cannot be admitted as conclusive, except to prove that all the Slavonians, who were divided into various tribes or nations, could easily understand each other. The truth of this fact cannot be doubted; for notwithstanding the lapse of ages, during which many Slavonian nations have remained completely isolated from several of their kindred populations, and have lived in constant intercourse with nations of an entirely foreign race, their respective dialects preserve a strong similarity, so that a Slavonian inhabiting the shores of the Frozen Sea may frequently understand the language of those who live on the coasts of the Adriatic. This fact is moreover corroborated by the circumstance that the monuments of the different Slavonian languages, though written several centuries ago, exhibit a much greater similarity among themselves than is the case with those languages in our time. We may therefore conclude that at some unrecorded period all the Slavonian race had the same tongue, which began to split into different dialects at the same time when the race, increasing in numbers, began to divide into various tribes; and that the differences among those dialects grew in the same proportion as the surrounding tribes who spoke them became more estranged from each other by physical, political, and religious causes. The Slavonian tongue is generally considered to have an Indian origin, and this supposition is founded on the great number of Sanscrit roots which it contains, as well as on some traces of a similar origin exhibited in the religion of the antient Slavonians, of which the most striking circumstances are the burning of widows on the funeral pile of their deceased husbands, the idol of Sviatovid, represented with four heads, and other resemblances of a like kind. The most antient written Slavonian language is that into which Cyrillus and Methodius translated the Scriptures in the ninth century, and which must have been the dialect of the Slavonians who inhabited the banks of the Danube, for whom this translation was made from the Septuagint, and for which an alphabet, formed on the model of the Greek one, was introduced by the translators.

Although the above-mentioned alphabet was adopted for the tranlation of the Scriptures, it is impossible to admit that the Slavonians were, previously to their conversion to Christianity, totally unacquainted with the use of letters, and indeed the Bohemian chronicles speak of legislative tables (deski pravodatne) in the seventh century. (Palatzky, *Geschichte von Böhmen*, vol. i., p. 182.) The antient Slavonian name for a wizard (*czarnoknijnik*), signifying one occupied with black books, leads to the supposition that the antient Slavonian conjurors made use of certain writings in performing their incantations. Martinus Gallus speaks of Polish chronicles previous to the introduction of Christianity, which were destroyed by Christian missionaries. Dithmar of Merseburg, who wrote in the eleventh century, positively states that the Slavonian idols had inscriptions on them, a statement fully confirmed by the discovery of the monuments of the antient Slavonian worship found at Prillwitz. It is true that the above-mentioned inscriptions were Runes borrowed from the Scandinavians, and one of them was Greek, which may lead to the conclusion that the Slavonians employed foreign characters, but they tend to show that they were not strangers to the art of writing.

The conversion of the south-eastern Slavonians by Greek missionaries was a circumstance highly favourable to their national language, as the Eastern church left to the newly converted nations the use of the vernacular tongue in the performance of divine service, instead of introducing the Latin, as was the case with the Western church. The conversion of the majority of the Slavonians was effected principally by the exertions of Cyrillus and Methodius. As early as the seventh century a great number of Slavonians has been converted to Christianity, and were followers of the Eastern church. This seems to have been particularly the case with those who had settled within the confines of the Greek empire, whilst those who lived beyond its borders remained either in a complete state of idolatry or exhibited only some individual conversions. Among the Slavonian states of that time, the most important was that of Grand Moravia, which must however not be confounded with the province that now bears this name: it extended over part of Hungary and some adjacent countries, and it was converted, though it appears rather nominally than really, about the beginning of the ninth century, by the missionaries of the West; for the Papal records prove that Moravia about 820-830 was under the spiritual authority of the archbishop of Passau. Nestor, a monk of Kief, one of the oldest Slavonian chroniclers, says that the princes of Moravia sent, about 863, a message to the Greek emperor Michael, stating that their country was baptised, but that they had no teachers to instruct the people and to translate for them the sacred books, and accordingly they requested him to send them men capable of performing such a task. The emperor complied with their request, and sent them the two brothers named Cyrillus and Methodius, natives of Thessalonica, who were distinguished by their learning as well as piety, and possessed a thorough knowledge of the Slavonian tongue.

The missionaries, having arrived in Moravia, translated the Scriptures, or at least a part of them, into the Slavonian tongue of the country; they also invented the letters, which, being called the Cyrillic alphabet, are still used, with some few variations, by the Slavonians who follow the tenets of the Eastern church, who also employ in the performance of divine service the same Slavonian idiom into which the Scriptures were translated, and which is now become the sacred tongue of those nations. Cyrillus and Methodius, having completed the translation, established the worship in the vernacular language, founded schools, and organised everything necessary for the promotion of the Christian religion. They extended their labours beyond the frontiers of Moravia, and converted Bohemia, A.D. 873. It is even posed that they visited Poland, and there can scarcely doubt that their disciples were active in that country.

apostolical labours of Cyrillus and Methodius took place during the time of those disputes between the patriarch of Constantinople and the pope of Rome which led to the final separation of the Eastern from the Western church. Among many causes of dispute, the dominion over the newly converted Slavonian nations formed an important subject of contention between Rome and Constantinople. Cyrillus and Methodius, although they introduced among their new converts the rites of the Eastern church, and the worship in the vernacular tongue, acknowledged the supremacy of the pope, and not that of the Greek patriarch, as is evident from the approbation of their proceedings, which they sought and obtained from pope John VIII., before whom they were accused of deviating from the line of conduct followed by Roman missionaries in the conversion of pagan nations.

The confirmation granted by pope John VIII. to the national mode of worship introduced by Cyrillus and Methodius, was rather a concession extorted by circumstances, and particularly by apprehension lest the missionaries, in case of refusal, should transfer their obedience from Rome to Constantinople, than a real approbation of the use of the vernacular language in the divine service, a principle considered by the Western church as prejudicial to its polity, the object of which is not only unity of dogma, but also uniformity of ritual; and indeed although some successors of John VIII. assented to the Slavonian mode of worship, they constantly endeavoured to abolish it, or at least to limit its use. This tendency became much stronger when the final separation between the Eastern and the Western churches removed the reasons which the latter had for conciliating the nations that were wavering between the two churches. Rome declared an unrelenting hostility against every ritual which deviated from that which it had established, and the council of Salona, held in 1060, proclaimed Cyrillus a heretic, and his alphabet a diabolical invention. The kingdom of Grand Moravia was destroyed by the pagan Hungarians about the middle of the tenth century, and the Slavonian population either fled to other countries inhabited by their own race, or remained under the yoke of their conquerors, who, having embraced Christianity from the Western church, promoted the papal views as to the Slavonian worship. In Bohemia the same worship struggled for some time against the Roman ritual, till its last stronghold, the convent of Sazava, was abolished in 1094, and the Slavonian books were destroyed by the zealous promoters of the Roman ritual. In Poland, where Christianity was established in 966 by Bohemian priests, when the national mode of worship was still prevailing in that country, and where Christianity had partly penetrated, even before its final triumph, from Moravia and Greece, the same mode of worship struggled for some time against the Roman ritual, and seems to have been continued in some parts as late as the fourteenth century.

The Slavonian service and the use of the Cyrillic letters, which were completely superseded by the Latin worship and letters among the Slavonians who followed the Western church, remained in full vigour among those who belonged to the Eastern church. This was the case with the Servians and other Slavonians of the Danube, the population of Muscovy, and of many provinces of Lithuania and Poland. And it is moreover used by the Wallachians, who inhabit Moldavia, Wallachia, and several parts of Hungary, although their language is derived from the Latin and has only a slight admixture of the Slavonic. Several Slavonian nations, which had originally followed the Eastern church, but submitted to the supremacy of Rome after the union of Florence, were allowed to retain the Slavonian liturgy and the use of the Cyrillic letters. The most antient manuscripts written in the Cyrillic alphabet are the gospel of Ostromir, written in 1056, which is preserved at St. Petersburg, and a Sbornik, or collection of religious tracts, of the year 1073, now at Moscow. An inscription in the same letters, preserved in a church at Kief, is supposed to date from the reign of Vladimir the Great. The first printed works with the same characters are a book of prayers, entitled 'Oktoikh,' &c., printed at Cracow in 1491, and another work of a similar description, at Venice in 1493.

Besides the Cyrillic letters, there is another alphabet used by some Slavonian populations of Dalmatia and Illyria, which is called the Glagolite character, and the use of which, as well as of the liturgy in the Slavonian language, has been allowed by the Roman see to these nations. The invention of that alphabet has been ascribed to St. Hieronymus, a native of Dalmatia, but this origin of the Glagolitic letters, probably invented by their advocates in order to gain the approbation of Rome, cannot stand the test of historical criticism, as St. Hieronymus lived in the fourth century, being born A.D. 331, in Dalmatia, while the Slavonians settled in that province only in the seventh century. Many Slavonian scholars supposed that the Glagolitic alphabet was comparatively a modern invention, and that it was nothing more than the Cyrillic, disguised by some alterations and the addition of superfluous ornaments. This opinion was supported by the circumstance that the oldest monument of the above-mentioned characters was a Psalter written in the thirteenth century, and their invention was considered on that account to be of no earlier date. The same opinion seemed to be corroborated by the *fact* that it was only in 1248 that Pope Innocent IV. permitted the use of the Slavonian liturgy, and of those letters which they had from St. Hieronymus, to those nations that had still retained them. This theory about the Glagolitic alphabet, which was combated by many Slavonian scholars, has been *recently* overturned by the learned Kopitar, librarian of the Imperial Library at Vienna, one of the first Slavonian scholars of our time. He has proved, from a manuscript written in the Glagolitic characters, that the Glagolitic character was coeval with the Cyrillic, if it was not more ancient. This manuscript, which was long considered to be an autograph of St. Hieronymus, is of a very ancient date, and belongs to Count Cloz, in the vicinity of Trento. The lovers of Slavonian antiquity may consult Kopitar, *Glagolita Clozianus, &c.*, Vienna, 1836.

It has been said that the liturgy in Slavonian with the use of the Glagolitic letters was approved by Pope Innocent IV. in 1248. A Slavonian missal was printed in these characters, at Venice, in 1491. In the tenth century, when a revision of the Roman missal and breviary was made by the order of the popes, the same measure was extended to the Slavonian missal, and the congregation *De Propaganda Fide* intrusted that task to a Franciscan monk, Raphael Levakovich, a native of Croatia; but as he was not completely master of the sacred Slavonian tongue, he called to his assistance Terletzki, a Greek bishop of Lutzko in Poland, who, having subscribed the union with Rome at Brest in Lithuania, in 1596, came to Rome. Terletzki replaced many words which he could not understand, by others employed in the Slavonian liturgy of the Greek churches in Poland and Russia, by which the original text was spoiled. The Slavonian missal thus revised was printed at Rome, 1631-1648. Another revision was made by Rastricius, a Dalmatian clergyman, who spoiled it still more by substituting modern words for those which he could not understand. It was printed in 1688-1706. The third and last revision of the Slavonian missal, published in 1741-1748, was made by Mathias Caraman, a clergyman of Dalmatia, who, having remained for some time at St. Petersburg, and acquired a thorough knowledge of the Russian language, disfigured the missal still more by introducing into it many Russian idioms, so that the missal became less intelligible to the inhabitants of Illyria and Dalmatia, for whom it was designed, than it had been before.

Except the populations of Dalmatia and Illyria, who, as we have just said, have retained the Slavonian liturgy and the use of the Glagolitic characters, all the other Slavonian nations which were converted by the Western church adopted the Latin alphabet.

The sacred Slavonian tongue, having been originally the dialect of the Slavonians who inhabited the banks of the Danube, cannot be justly regarded as the mother tongue of all the Slavonian dialects now extant; we shall therefore give its characteristics in speaking of the Slavonian languages in general. It continued to be employed for some time in the composition of sacred books, as well as chronicles, among the Slavonian nations who adhered to the Greek church, and particularly the Russians, but we shall have an opportunity of mentioning it hereafter in speaking of the literature of those nations.

General Characteristics of the Slavonian Languages.—The Slavonian languages are distinguished by the richness of their vocabulary, which consists not only in the great number of words, that is, a great quantity of synonymes, but also in the number of inflexions, both at the beginning and the end of words, which gives a facility of creating from one radical word an extraordinary number of derivatives. By the simple prefixing of the letters *u*, *z*, *r*, *w*, the verb acquires a different signification. The great facility with which the Slavonian languages receive new forms and additions is chiefly owing to their manifold declensions and their numerous tenses and participles, and they excel in that respect all the modern languages of Europe. The declensions, of which there is a great variety, are formed by the inflexion of the termination, and without any articles. The participles possess a great pliability by uniting in themselves the advantage of verbs and adjectives, and denoting as verbal adjectives at once the quality of the thing and the determination of the time, thus saving the use of relatives, as who, which, and prepositions, as after, since. This circumstance gives them a great conciseness, which is increased by the absence of auxiliary verbs. Another advantage of the Slavonian languages is their great facility of compounding words: it is possible to form from native roots all the scientific words which the languages of Western Europe have *derived* from the Greek and Latin. These languages contain not only diminutives to express small objects, and which are also used as terms of endearment, but likewise augmentatives, to express a thing of a larger size than usual. They have the patronymic which is formed by the addition of *wich*, answering to the Greek *ides*. There are also frequentative and inceptive verbs. The verbs are conjugated without the use of pronouns, which adds considerably to the conciseness of these languages, and the preterits of the third person singular and plural designate the sex by a variation in the last syllable. Many prepositions and much circumlocution of different kinds are saved by the use of the instrumental case corresponding to the ablative. The Slavonian languages have the dual number. They have several preterit tenses and many future ones, &c. It may be easily concluded from what we have said of the Slavonian languages that they must possess great expressiveness and energy, and that they are able to represent every object of imagination and of passion, as well as all the higher emotions of the poet and the orator, in a manner not inferior to any modern language, and superior to many; and that they are eminently fit for the translation of the classics. We must also add, that the Slavonian languages possess every sound contained in other languages, except the English *th*.

Russian Language and Literature.—The Russian language may be divided into three dialects. 1. The dialect of Great Russia, or Muscovy, which, since the time of Peter the Great, has been formed into the present literary language of Russia, and is subdivided into the minor dialects of Novgorod, Suzdal, and Rezan. The dialect of Great Russia is distinguished from other Slavonian languages by the admixture of some words and sounds of a Finnish origin, as the population which speak this dialect partly came from some Finnish tribes that were absorbed by the Slavonians. It also contains many Oriental words, which were introduced under the Tartar dominion, but these words have generally their Slavonian synonymes. 2. The dialect of Little or Southern Russia is spoken by the population of the Ukraine, the antient Polish provinces of Volhynia and Podolia, as well as that of Gallicia, or Austrian Poland. It differs from the dialect of Great Russia not only in many expressions, but also in many turns and grammatical forms, which often rather resemble those of the Polish language than the above-mentioned dialect. It is perhaps the softest of all the Slavonian dialects; it is full of picturesque expressions, and its diminutives, used as terms of endearment, have a peculiar sweetness. The national songs and ballads of the population who speak this dialect, are distinguished by great depth of feeling, and their music, although composed by simple peasants, is generally very beautiful. It was cultivated under the dominion of Poland, which continued for many centuries, and it may be regarded as a provincial dialect of that country. 3. The dialect of White Russia is now spoken by the population of the governments of Mohiloff, Witepsk, and Smolensk, as well as some adjacent districts. It is less harmonious than the dialect of Little Russia. It is considered by philologists as being of high antiquity, and it was the official language of Lithuania till the latter part of the seventeenth century; the code of that country was originally composed in it.

The present literary language of Russia participates in all the merits of the other Slavonian languages; and it has been enriched by its authors, who have introduced many new words, either from the Slavonian sacred tongue or formed from its own roots. It is more harmonious than many other Slavonian languages, being richer in vowels, a peculiarity which is ascribed to the influence of the Finnish language, which is characterised by an extraordinary softness.

The history of the Russian language and literature may be divided into two great periods, one comprising the time before the reign of Peter the Great, and the other the period since his reign. The first period may be subdivided into three: the time from the introduction of the Christian religion in the tenth century, to the establishment of the dominion of the Tartars in the thirteenth; 2, the time from the dominion of the Tartars, or from the middle of the thirteenth to the middle of the fifteenth century; and the 3rd, from that time to the reign of Peter the Great, or the end of the seventeenth century. The written language of the first period is the Slavonian sacred tongue, into which the Scriptures were translated by Cyrillus and Methodius. The most remarkable author of that period is Nestor, a monk of the cavern convent at Kieff,* who was born in 1056, and who is the first chronicler of Russia and the father of Russian history. He was evidently a learned man. He knew Greek, and was acquainted with the Byzantine writers, from whom he translated and inserted into his chronicles several passages. He collected his information from tradition, and possibly from some now unknown records. He was much indebted to the narrative of his fellow monk Ian, who died in 1106, at the age of ninety-one, and was consequently born one year after the death of Vladimir the Great, who died in 1015, and must have known many persons who were witnesses of the great event of the establishment of the Christian religion in Russia by Vladimir in 988-9. Nestor also described many events which happened in his own time. His style is an imitation of that of the Bible, and he often makes the individuals who are the subjects of his history speak in the first person, as is the case in the historical books of the Old Testament. His Chronicle was continued after his death in 1116, by Abbot Sylvester, till 1123. Two other monks continued it till 1203. It has gone through many editions, and it has been often translated. The best translation is the German, with a valuable Commentary, by the learned historian Schlözer, Göttingen, 1802-4, in five volumes. After Nestor's Chronicle, the most remarkable literary monument of that period is the last will, or instructions to his children, of the grand-duke Vladimir, who was surnamed Monomachos, after his maternal grandfather the emperor Constantine Monomachos, and died in 1125. It contains precepts of Christian morality and of government; and it gives us an insight into the state of learning of that period, which seems to have been more advanced among the higher classes in Russia than in Western Europe. He says, when recommending his children to seek for information, 'My father remaining at home, that is, not having travelled, spoke four languages, for which we are praised by foreigners.' These last words imply that the knowledge of foreign languages was common at that time in Russia, but it is impossible to know what those languages were. We may however suppose that Greek was studied by the clergy, who were continually coming from Constantinople to Russia, and that the Scandinavian was cultivated by the higher classes, as the Russian princes, being sprung from a Norman stock, had at that time considerable intercourse with Sweden and Norway. Vladimir married, about 1070, Gida, daughter of Harold, the last Saxon king of England, who had retired to Sweden after the death of her father.

Several theological works of this period still exist. The most remarkable are two Epistles of Nicephorus, metropolitan of Kieff. There is also a description of a Journey to Jerusalem a few years after its conquest by the first crusaders, by a Russian abbot named Daniel. The only extant poetical production of that period is the poem of the 'Expedition of Igor.' It is written in poetical prose, and describes an unfortunate expedition against the nomadic nation of the Polovtzi, or Comanes, by Igor, a petty prince of Novgorod Severski, in 1182. It contains much fine poetical imagery, and though written at a time when Christianity was completely established, the author introduces into his poem the gods of the Slavonian mythology, which leads to the supposition that the traditions of that mythology still lived in the national poetry. It appears, from the apostrophe to the different princes of Russia, to have been written imme[illegible] after the event had taken place which forms the su[illegible] the poem. This precious monument of antient R[illegible] literature was discovered, in 1796, by Count Moossin P[illegible]kin. There have been several translations of it i[illegible] present Russian, as well as into Bohemian, Polish, [illegible] German. The code of laws given by the grand-d[illegible] Yaroslaf to Novgorod belongs to the same period, d[illegible] which Russia enjoyed comparatively a high degree of [illegible]lization, owing to the influence of Byzantine litera[illegible] science, and art. Besides Vladimir Monomachos, [illegible] other princes and princesses are mentioned as havi[illegible]tivated and encouraged learning, and libraries are s[illegible] of as containing Greek and Latin manuscripts.

The progress of this civilization was stopped by th[illegible]vasion of the Tartars, who established a reign of ig[illegible] barbarism in the north-eastern principalities of Russia. [illegible] separated them completely from the rest of Europe. T[illegible] clergy still continued to maintain some intercourse [illegible] Constantinople, but the Greek empire was rapidly dec[illegible] and the few learned men whom it produced were aver[illegible] visit a country which was under the yoke of barb[illegible] The customs of the country were orientalized, as the i[illegible]bitants adopted many things from their Tartar m[illegible] The clergy, who were much favoured by the Tartars, [illegible] not take advantage of their position in order to cul[illegible] learning or establish schools. They composed h[illegible] several spiritual works, and some chronicles in the [illegible] Slavonian tongue. There are also extant some [illegible] translated from the Greek during that period; as, f[illegible]stance, of Alexander the Great from Arrian, on the [illegible] of antiquity, the rich Indies, &c. The popular so[illegible] historical subjects, particularly on the times of Vlad[illegible] Great, are supposed to have been composed dur[illegible] same period by the people, who solaced themselves d[illegible] their oppression by the traditions of better times. T[illegible] were however several authors in this period. Cy[illegible] metropolitan of Russia, who died in 1406, was a n[illegible] Servia, and brought with him to Moscow a great num[illegible] Slavonian manuscripts. He composed and translated [illegible]veral spiritual works, and made a collection of Russia[illegible] Demetrius, probably a monk, translated, towards the [illegible] of the fourteenth century, from the Greek, the p[illegible] George Pisides, metropolitan of Nicomedia (who liv[illegible] the seventh century), entitled the 'Creation of the W[illegible] This translation was such an uncommon event, that [illegible] chronicles of the time mention it as such. The Diac[illegible] Ignatius, who accompanied the metropolitan Pimen [illegible] journey to Constantinople in 1389, left a detailed desc[illegible] of that journey. Sophronius, a clergyman of R[illegible] towards the end of the fourteenth century, wrote a p[illegible] description of the invasion and defeat of the Tartars, [illegible] Mamay, in 1380. A merchant of Tver, called N[illegible] went, about 1470, to the East Indies, and left a diary [illegible] travels. It neither displays particular talent for o[illegible]tion, nor does it contain much information, but it is [illegible]esting, as it shows the route which was then followed [illegible] the commerce from Europe to India.

Third Period: from the Termination of the Tartar [illegible]nation to Peter the Great.—Soon after Muscovy had [illegible] liberated from the yoke of the Khans, it begun t[illegible] some intercourse with the west of Europe. The ma[illegible] of the grand-duke Ivan III. with the Greek princess S[illegible] Palæologus, who had resided at Rome, contributed g[illegible] to the increase of that intercourse and the progress of [illegible]lization in Muscovy. Many Greeks who accompan[illegible] princess Sophia brought valuable Greek manuscripts. [illegible] Venetian architect Fioravanti Aristoteles built s[illegible] churches, the Kremlin, and some other palaces at M[illegible] Foreign artists cast cannon and bells, and coined m[illegible] Under Ivan's son Vassili the intercourse with Europe [illegible]creased, and embassies were sent and received from s[illegible] states. Under Ivan Vassilevich the Terrible (1[illegible] civil and an ecclesiastical code were composed, comm[illegible] intercourse was opened with England, and a printing [illegible] was established at Moscow. Boris Godoonoff [Go[illegible] was a great promoter of learning: he designed to es[illegible] at Moscow a university with foreign professors, but th[illegible]ject was defeated by the opposition of the patriarch, [illegible] feared that such an institution might be dangerous t[illegible] orthodoxy of his church. Boris patronised learned [illegible]reigners, and paid an immense sum to the tutor of [illegible] to whom he was giving a European education. A general map of the Muscovite dominions was also made by his orders. The events which agitated Muscovy after the death of Godoonoff, put a stop for some time to all improvement, but when tranquillity was restored, after the accession of Michael Federovich (1613-45), the course of improvement was resumed. Many foreigners were taken into the service of the Czar, and Greek and Latin schools were established in the house of the Patriarch in 1643. Under Alexey Michaelovich several manufactures were introduced, and a regular communication with western Europe was opened by the establishment of the German post, which carried letters twice a week from Moscow to Riga and Vilna, but there was no such accommodation for the interior. Several foreign books were translated; of which the most remarkable is one on military science, printed at Moscow, in 1644. A German newspaper was regularly translated for the Czar, but his foreign office seems not to have profited much by the information, for the credentials of the embassy which was sent by the Czar, in 1662, to Madrid, were directed to Philip IV., who had died two years before. The number of foreign officers was increased, and some regular troops were formed after the European fashion; but the most remarkable event of that reign is the *Ulojenie*, or code of laws, which was formed by order of the Czar, and printed at Moscow in 1649. The acquisition of Kieff, which possessed an ecclesiastical academy, founded under the Polish dominion [Russian Church], favoured the progress of learning among the Russian clergy. Under Fedor Alexeyvich (1676-88) a Græco-Latino Slavonian academy was founded at Moscow on the model of that of Kieff. The great map of Russia made under Godoonoff was revised and improved. During the regency of the princess Sophia (1682-89), Prince Galitzin, who was her principal minister, introduced many European refinements and luxuries into his house, and his example was imitated by other grandees.

---

* There are at Kieff extensive caves filled with [illegible] of saints, and known under the name of '[illegible],' or caverns, to which a convent is attached, called after the name of the caverns.

The Slavonian language continued to be used in all ecclesiastical compositions, as well as by the chroniclers, but the common dialect of Moscow began to be adopted in all official acts of the government. At the same time the dialect of White Russia, which was the official language of Lithuania, was penetrating to Moscow, and there are several diplomatic notes addressed by the grand-dukes to foreign princes, which contain an admixture of that dialect, and even many Polish words. In the sixteenth century, and at the beginning of the seventeenth, the works of St. Ambrosius, Augustinus, Hieronymus, and Gregory, as well as the 'History of the Twelve Cæsars,' by Suetonius, were translated into Slavonian. Some tales written in a mixture of the Slavonian and the common dialect of Moscow belong to that period. Joseph, Hegumenos or abbot of a convent at Volokolamsk (died in 1516), became celebrated by his writings and personal exertions against the Jewish sect of Raskolnichi. [Russian Dissenters.] Part of his works were printed in the collection of materials for Russian history, entitled 'Antient Russian Bibliotheca.' His contemporary Gennadius, archbishop of Novgorod, an equally zealous persecutor of the above-mentioned sect, wrote several pastoral exhortations on the same subject. Macarius, metropolitan of Moscow (died in 1564), is the author of the lives of several saints. The annals known under the name of 'Stepennaya Kniha,' that is, the graduated book, were composed under his superintendence, and indeed the authorship has been ascribed to him. They are so called because they are divided into chapters, each of which contains the reign of one sovereign, and is called a grade. Maxim, a Greek monk of the convent of Mount Athos, and a man of great learning, who had studied at Paris, Florence, and other places in Western Europe, came to Moscow by the desire of the Czar Vassili Ivanovich, in order to revise the corrupted text of the sacred books used in Muscovy [Russian Church], and to arrange the Greek manuscripts which were in the possession of the Czar. It is said that he was astonished at the value and rarity of some of those manuscripts. He made a complete catalogue of them, and presented to the Czar a list of those sacred works which had not yet been translated into the Slavonian tongue. The Czar commissioned him to translate the commentaries on the Psalter, and gave him two translators and two copyists to assist him. After a labour of seventeen months, Maxim presented to the Czar his translation, which was received with much approbation by the metropolitan and all the clergy. He wished to return to his convent on Mount Athos, but he was persuaded to remain at Moscow, in order to revise the text of the sacred books, which had been corrupted by ignorant copyists. He devoted nine years to that important labour, but the favour of the Czar and the reputation which he had acquired excited great jealousy, and created enemies, who accused him of falsely expounding the Scriptures. He was confined in a convent in 1525, where he died in 1536, and his pupils shared his fate. He was engaged till his death in the composition of theological, philosophical, and ethical works; among others, he wrote in Slavonian a dissertation on the utility of grammar, rhetoric, and philosophy, which was an extraordinary performance at that time.

A monk called George composed a Russian chronicle, which reaches to the year 1533. Two merchants, called Korobeinikoff and Grekoff, were sent in 1583 by the Czar Ivan Vassilevich to distribute alms in different holy places of the East for the soul of his son, whom the Czar had murdered in a fit of passion. They visited Constantinople, Antioch, Jerusalem, Alexandria, Mount Sinai, and some other places, and kept a diary of their journey, which has been printed. Prince Kurbski, descended from a branch of the Ruric, or reigning house of Muscovy, and related to the Czar Ivan Vassilevich the Terrible, was born in 1529, and was one of his boyars and principal generals. He distinguished himself at the capture of Kasan in 1553, and in several other campaigns; but in 1564 he was obliged to seek refuge from the tyranny of his monarch in Poland, where he was kindly received by king Sigismund Augustus, who granted him estates. In his exile he devoted himself to literature and learnt Latin. He wrote the reign of the Czar Ivan Vassilevich, and the campaigns in which he himself had taken a part. This work is one of the most valuable contributions to the history of that period. He also wrote several letters to the Muscovite prince, upbraiding him for his tyranny, and proving by the Scriptures and the works of the antients that his conduct was very bad. Ivan Vassilevich answered all these letters, endeavouring to convince Kurbski, particularly by passages of Scripture, that it was he who was in the wrong, and that he had no right in any case to rebel against his sovereign.

In the seventeenth century the following authors deserve notice: Abraham Palitzin, abbot of the celebrated convent of Troytza or Trinity, distinguished himself by his patriotism in the year 1612, and left a description of the siege which the convent sustained against the Poles. Kubassov wrote a chronological universal history, beginning with the creation of the world. Epiphanius Slavinetski, a native of Poland, after having studied at Kieff and other academies, adopted the monastic life in Kieff. He was called to Moscow in 1649, by a boyar of the name of Rtishchef, in order to translate theological works from Greek into Slavonian, and he translated several of the works of St. John Chrysostomus, Gregory of Nazianzus, Basilius the Great, and other fathers of the church, which were printed at Moscow in 1664-65. He also made a complete Greek-Slavono-Latin Dictionary in two volumes, and a Philological Lexicon, or a comparison of passages of the Greek fathers. He was commissioned in 1664 by the Patriarch and the Czar to make a new version of the Scriptures from the Greek into Slavonian, but he was prevented by death from accomplishing that important work. Simeon of Polotsk, a native of that city in Poland, studied in his native country and in some foreign universities, and having become a monk, he went to Moscow in 1667, where he was appointed by the Czar Alexey Michaelovich tutor to his son Fedor. He wrote many poems, which were much praised at the time, although they are no longer readable. He was also the first who introduced the practice of writing sermons for his congregation, which was already usual with the Greek clergy of Poland. It had hitherto been the custom in Muscovy only to read sermons selected from ecclesiastical authors and approved by the patriarch. Sylvester Medveyeff, a pupil of Simeon of Polotsk, and abbot of a convent at Moscow, wrote many polemical works; but being suspected of a tendency to Romish doctrines, he was deprived of his clerical dignity, and confined in a convent; in 1691, being accused of participation in the revolt of the Strelitz, he was executed. He left several poems. Prince Shakhovski lived in the first part of the seventeenth century. Having fallen into disgrace with the Czar Michael Fedorovich, he was confined in a convent, where he composed epistles on religious subjects, of which the most remarkable is an Epistle on the orthodox faith to the highest Shah Abbas, king of Persia and Media, addressed in the name of the high archbishop and servant of God, the most holy Patriarch Philaret Nikitch. In this epistle he expresses his thanks for a relic, a supposed fragment of the garment of Jesus Christ, sent by the Shah to the Czar, and exhorts him to embrace the Christian religion.

The conquest of Siberia brought the court of Moscow in contact with China and some states of central Asia. An ambassador named Baykoff was sent to Pekin in 1654, and returned in 1658; he left a very curious description of his embassy, which has been translated into several foreign languages. A Cossack of Siberia named Petlin explored in 1620 the course of the river Oby, and wrote a description of his journey.

The first attempts at dramatic representations appeared in Russia about the middle of the seventeenth century. They were introduced from Poland by the students of the ecclesiastical academy of Kieff, who were used to perform plays on Scriptural subjects in Polish, Slavonian, and the dialect of Little Russia. They performed these plays during the vacation time in several towns of Russia, and they were finally introduced at Moscow by Simeon of Polotsk, whom we have mentioned. In 1676 German actors performed before the Czar Alexey plays taken from Scriptural history accompanied with ballets. The Princess Sophia, the eldest sister of Peter the Great, was very fond of theatrical amusements, and wrote several dramas, which she performed with her court.

The Second Period of Russian Literature: from Peter the Great to the present time.—It is unnecessary to expatiate on the civilization which Peter the Great introduced into Russia. He established many primary schools in different parts of his dominions, and a military and naval school at St. Petersburg. He sent young Russians abroad to study the various sciences and arts; he took into his service many foreigners of talent, collected books, cabinets of natural history, and got together philosophical instruments. A new alphabet, simplified from the old Slavonian, formed, as it is said, by himself, was introduced; but the language made no great progress from the state in which it had been during the preceding reign, and it was inundated with many foreign words introduced under Peter's reign, who showed perhaps too much predilection to everything foreign. Among the most remarkable authors of his time is Theophan Prokopovich, archbishop of Novgorod, a native of Kieff, but educated in Poland. He wrote many works on divinity, politics, and history, as well as sermons, orations, and some poetry. His works display considerable talent, notwithstanding their barbarous style. He also wrote in Latin, and his style in that language is much better than his Russian. Stephen Javorski, metropolitan of Rezan, a native of Leopol in Poland, and Demetrius, metropolitan of Rostov, a native of the environs of Kieff, who was canonized after his death, wrote many works on theological subjects. Gabriel Bushinski, bishop of Rezan, translated some of the works of Puffendorf and other authors, relating to history and politics. Kopievich, a native of Lithuania, studied in Holland, and passed from the Greek persuasion to Protestantism. He became pastor at Amsterdam. Peter the Great, during his visit to that city having been acquainted with Kopievich, gave him a commission to compose school books and other useful works in the Russian language. Accordingly he wrote and translated many books on several literary and scientific subjects, which were printed at Amsterdam. Prince Chilkoff (died in 1718) wrote an abridged history of Russia, which was used in schools, but has since been superseded by other works. Great service was rendered to primary instruction by Ernest Glück, a Lutheran clergyman of Livonia, who, being taken by the Russians, was employed by Peter the Great in establishing a school at Moscow for the children of burghers. He published many school-books, and among others, the 'Orbis Pictus' of Comenius.

Peter's successor, Catherine I., founded the Academy of Sciences at St. Petersburg, which was projected by her predecessor. Its object was to prepare teachers for public schools, to publish useful works, and to collect all kinds of information about Russia. The imperial physician Blumentrost was appointed president; and many learned foreigners, as De Lille de la Croyere, Bernoulli, Bayer, and others, were nominated members. The academy established a high school for the formation of teachers, caused many tific treatises to be written, and promoted geographical eries. De Lille de la Croyere accompanied Behring on his expedition in the Pacific Ocean, and died from the hardships of the voyage. A great number of classical authors, Greek and Latin, were translated and published under the superintendence of the academy; but these translations, being made in a language which was not yet formed, and published at a time when they could scarcely find any readers, did not contribute to the progress of literature, and they found few purchasers. The reign of the empress Anna was not favourable to the national literature. The court, which was governed by Biren, imitated everthing that was foreign, and showed the greatest contempt for all that was national. These circumstances had a very unfavourable effect on the national language and literature, although Lomonossoff was preparing a salutary revolution towards the end of that reign. A favourable change took place under the empress Elizabeth, who was a great patroness of science and literature. The Academy of Sciences was enlarged by the addition of a section of arts, and its income increased in 1747, and in 1752 the University of Moscow was established on the proposition of Count Shoovaloff,* a distinguished patron of learning; and it was by the exertions of the same nobleman that the Academy of Arts for painting, sculpture, and architecture was founded. Geographical knowledge was also advanced by the discoveries which some Russian adventurers made in the Pacific.

Among the principal authors of this period was Prince Antiochus Kantemir, son of the hospodar, or reigning prince of Moldavia, who removed to Russia with all his family during the expedition of Peter the Great into that principality. He was born at Constantinople in 1708, and was educated at Kharkoff and Moscow, under the superintendence of a Greek clergyman, and also of his father, who was himself a learned man. Antiochus made such progress, that when he was only ten years old he wrote a Greek panegyric on St. Demetrius, which was read in a church. Owing to his extraordinary talents and high rank he obtained rapid preferment. In 1731 he was nominated Russian minister at London, where he remained till 1738, in which year he was transferred in the same capacity to Paris, where he remained till his death in 1744. He wrote eight satires, which were published at St. Petersburg in 1762; but translated into French during the author's lifetime. His language and versification belong to the old school; but in his satires he displays great power of observation, and such genuine wit, that they are still read with pleasure. He also left a translation of Horace's 'Epistles,' Fontenelle's dialogues on the 'Plurality of Worlds,' and a great many other translations from the classics, as well as from French and Italian writers. Living in constant intercourse from 1731 to 1744 with the first wits of London and Paris, Prince Kantemir's works contain ideas and opinions which belong more to those seats of European refinement than to Russia, and consequently he cannot be considered as truly national. Lomonossoff Trediakowski (Basil), born at Astrakhan in 1703, studied at the university of Paris under Rollin, and travelled in many parts of Europe. In 1733 he was nominated secretary of the academy of St. Petersburg; and in 1745 appointed by a ukase professor of eloquence: he died in 1769. Trediakowski possessed considerable learning, but more industry than talent. He wrote several works on the principles of literary composition, and a great many poems; but his versification is cumbrous, and his language so little pleasing, that the empress Catherine II. enacted, in the humorous code which she made for her own immediate society, that the transgressors of certain regulations should be condemned to read several pages of Trediakowski's poem 'Telemachida,' which was a versified translation of Fenelon's 'Telemachus.' He translated many foreign works, chiefly on history: as an instance of his indefatigable industry we may mention, that after having completed the translation of Rollin's 'Antient History' in 26 volumes, the manuscript was destroyed by fire, upon which he again translated the 26 volumes, which were published at St. Petersburg (1744-67). Tatishcheff (Basil), born of an antient family in 1686, was one of those young men who were sent in 1709 for their education by Peter the Great to different parts of Europe. He acquired a good deal of scientific information, and became thoroughly conversant with the German and Polish languages. On his return home he was employed in many offices of great importance. In 1724 he was sent on a secret mission to Sweden; in 1734 he was invested with the supreme direction of the mines of Siberia; and in 1740 he was appointed governor of Astrakhan. It was there that our countryman Jonas Hanway, who speaks much of him, made his acquaintance. He died in 1750, holding the rank of a privy councillor. During his travels in Russia he diligently collected all kinds of information relating to that country, and acquired a rich store of materials for its history and geography. His principal work is a history of Russia, from the most antient times to the year 1462. He spent thirty years on this work, which was writen amidst his multifarious official avocations: it is, in fact, a comparative chronicle; the author having procured several copies of different chronicles, compared them, and made a comment on them by extracts from various foreign authors which related to the same subject. The manuscript of this work was kept for some time in the archives. The empress Catherine II. ordered its publication, which was done under he care of Gerhard Müller, in 1764-74. It is much to be regretted that the chronicles and other materials on which Taishcheff founded his work were destroyed by fire. He occupied himself with the composition of a complete geography of Russia, and a map of Siberia was made by his exertions, and published by the Academy of Sciences, in 1745, in 20 heets. He also wrote an 'Historical and Political Lexicon of Russia,' which he completed to the letter L, and which was published in 1793.

---

* Count Shoovaloff is known in French literature by his 'Epître a Ninon,' which was ascribed to Voltaire before the real author was known.

Stephen Krashennikoff, professor of botany to the Academy of Sciences (1713-1755), became known all through Europe by his 'Description of Kamtchatka,' which was published at St. Petersburg in 1755. He was sent by the Academy, with Steller, to examine this country, where he emained for many years, collecting the information which enabled him to produce a work of considerable merit, and which was translated into several languages.

The creation of a national drama in Russia dates from his reign. This honour belongs to Alexander Soomarokoff (1718-1777). He was educated partly in the house of his father, who was a general officer, and partly in the miliary school of St. Petersburg. The study of Corneille, Racine, and other French dramatic writers, awakened his alents, and he began to write tragedies about the year 1740, which were performed by the pupils of the military school, in the presence of the empress Elizabeth, who in 1756 nominated the author director of the court theatre. Soomarokoff wrote many tragedies, the best of which is 'The False Demetrius,' which has been translated into French and English, and also several comedies and operas. He was also the author of various minor poems, and numerous essays and dissertations in prose, on various subjects. Soomarokoff enjoyed during his lifetime, and some time afterwards, a great reputation, which has however declined, and his works are now little read. His dramatic productions are all imitations of the French school, and notwithstanding they display considerable talent, they are characterised by great affectation, and his heroes and heroines are never true to nature. His language also is now become obsolete.

Dramatic art in Russia begins with Volkoff, the son of a merchant of Kostroma, who learned German, painting, and music at Moscow. He established, with some other young men, a little theatre at Yaroslav, where they performed the dramas of Demetrius, bishop of Rostov. At St. Petersburg he saw the performances at the Italian court theatre, and he diligently studied its organization. Having thus improved his knowledge of the dramatic art, he returned to Yaroslav, where, with the assistance of some friends, he established a theatre, which contained a thousand spectators, and of which he was not only director and first performer, but also machinist and painter. Several young men of talent, as Popoff Dmitresski and others, joined Volkoff, whose reputation reached the court at St. Petersburg, where the plays of Soomarokoff were performed by the pupils of the military school. He was invited to court in 1752, and in 1756 an imperial ukase established a Russian theatre, of which Soomarokoff was appointed director, and Volkoff the first actor. He died in the prime of life, in 1763, but the pupils whom he had formed greatly contributed to the improvement of the national drama. Periodical literature also originated under the same reign. The first literary journal, which was entitled 'The Monthly Magazine for Utility and Amusement,' was edited by Gerhard Müller, and all the Russian authors of that time were contributors. In 1759 appeared the 'Industrious Bee,' edited by Soomarokoff.

The reign of Catherine II. was favourable to the civilization of Russia in many respects. Ambitious of every kind of distinction, she courted the applause of Voltaire and other French philosophers of that school, and these dispensers of reputation extolled the liberal and enlightened sentiments of that princess, notwithstanding her share in the destruction of Poland, and her continual invasions of the Turkish dominions, which were hailed by the same adulatory philosophers as so many steps towards the progress of the civilization of mankind; yet although the execution of Catherine's political schemes of aggrandizement was often stained by great atrocities, Russia is much indebted to her for encouraging literature and learning. The military and naval schools were enlarged and improved. A mining school was established in 1772, and it is still one of the best educational institutions in Russia. The University of Moscow and the Academy of Arts were enriched and enlarged. Several of the most distinguished members of the Academy of Sciences, as Pallas, Georgi, Richkoff, and others, were commissioned to undertake scientific travels in various parts of the Russian empire, and their researches contributed not only to extend the knowledge of that country, but also to the progress of science in general. A Russian Academy which had for its object the improvement of the Russian language was established on the plan of the French Academy, and it published a dictionary of the Russian language, a grammar, and other useful works of a similar description. The Society of the Friends of National Literature and History, established in connection with the university of Moscow, did great service. A commission for the organization of public schools was appointed, and it founded a seminary for teachers at St. Petersburg, one high school and twelve preparatory schools, and published under its superintendence many school-books. New schools, high as well as primary, were opened in several towns of the empire. Institutions for the education of the females of noble and burgher families were founded at St. Petersburg, where a number of pupils are maintained and educated free of expense, while others are admitted on the payment of a moderate sum. There were also established an agricultural society, a surgical school, and other useful institutions.

The Russian language, which is chiefly indebted to Soomarokoff for its improvement, was greatly enriched in this reign by the creation of new words from Slavonian roots, which were substituted for other words of a foreign origin: many new scientific terms also were introduced. Its grammatical construction was better developed, the versification was rendered more harmonious, and the style in general greatly improved by being purified from foreign expressions and idioms, which abound in the works of the authors belonging to the preceding period. Many literary periodicals were started, and some of them were continued with considerable success. The censorship of the press was remarkably liberal, and it seems indeed that Catherine, intoxicated with the flatteries of the French philosophers, entirely overlooked the tendency of their works, which were dangerous to such a government as hers. Many political works, such as those of Montesquieu, Delolme, Hume, Robertson, and Rousseau's 'Contrat Social,' were translated into Russian, and printed. This liberality was also extended to many productions of an immoral and irreligious tendency, and several works of this description, by Voltaire, Diderot, Rousseau, and others, were published in Russia. The effect of such works, in such a state of society as that of Russia, could not be very salutary.

Michael Kheraskoff (1733-1807), curator or supreme director of the university of Moscow, wrote the 'Rossiad,' an epic poem in twelve cantos, which describes the conquest of Kazan; and 'Vladimir, or the establishment of the Christian religion,' also an epic poem, in eighteen cantos. These two productions are considered his best, although they are far from having any real claim to the name of epic. His other poems are, 'The Pilgrims,' in six cantos, a production which displays much entertaining variety, and is written in various metres; 'The Fruits of Science,' a didactic poem; 'The Universe;' and 'The Battle of Chesme,' &c. Kheraskoff also wrote several novels, the subjects of which were taken from Greek and Roman history, and some dramas. The number of his productions, which is more than twenty, attests his great industry, and they show that he had considerable information; but the same praise cannot be extended to his poetical and creative talents. Basilius Petroff (1736-1799) was the son of a clergyman, and was educated in the ecclesiastical academy of

Moscow. He attracted the notice of Catherine II. by an ode on her coronation in 1763, and was appointed a translator of the imperial cabinet, and reader to the empress. He afterwards visited England, where he resided for some time, and after having travelled in other countries, he returned to St. Petersburg, where he was appointed librarian to the empress. The delicate state of his health compelled him, however, to abandon a career in which he might have expected rapid preferment, and he retired in 1780 into the country, where he devoted himself to literary pursuits and agriculture, visiting Moscow every winter, for the sake of the library. As one instance of his industry, we may mention that he learned modern Greek at the age of sixty. A complete edition of his works, in three volumes, was published at St. Petersburg in 1811: they consist of odes written on several solemn occasions, and epistles addressed to different persons. He also made a metrical version of the '*Æneid*,' which was published in 1781-86. Petroff's poems are characterised by genuine animation and energy of thought, expressed in a concise and powerful manner, and he would have equalled Lomonossoff if his style had not been so rough; though some of his odes are free from that reproach, and are written in flowing and harmonious verses.

Hippolyte Bogdanovich (1743-1803) was born in the Ukraine, and educated in a school at St. Petersburg. In his fifteenth year, by frequenting the theatre and reading plays, he became so enamoured of the dramatic art, that he addressed himself to Kherashoff, who at that time superintended the theatre of Moscow, and requested to be received as an actor. Kherashoff, who was struck with the talents of the boy, dissuaded him from this design, and taking him into his house, made him continue his studies at the university of Moscow, where he made rapid progress. He was afterwards employed in the foreign department, and was secretary of the Russian embassy at Dresden (1766-68). After his return to St. Petersburg, he continued in the civil service till 1795, when he settled in the country. Bogdanovich began to write poetry when he was seventeen, and when he was twenty he edited a literary periodical called the 'Innocent Amusement:' he displayed considerable talent in several minor poems, particularly by a very successful translation of Voltaire's 'Ode on the Destruction of Lisbon.' His poetical fame was established by his 'Dooshinka,' or 'Little Soul,' an exceedingly successful translation of La Fontaine's 'Psyche.' This poem, which not only equals, but in some respects surpasses the original, is still one of the most popular productions of Russian literature.

Gabriel Derjavin (1745-1816) was born at Kazan, and belonged to a family of Tartar origin, as appears from his frequent allusions to such a descent. He was educated in the military school of the engineers, and served in the army till 1779, when he passed into the civil service. He was governor of Olonetz and then of Tambov (1784-1791), and afterwards successively secretary of state, president of the college of commerce, treasurer of the empire, and finally minister of justice. In 1803 he left the public service, and lived till his death chiefly on his estate of Zvanka, in the government of Novgorod. Derjavin is undoubtedly the first Russian lyric poet, a distinction which he has earned by the boldness of his imagery, the harmonious flow of his versification, and the happy turns of his expressions. He created many new words, and restored several that were either obsolete or considered as unsuitable to a higher style; but although these innovations proved very successful with Derjavin, they produced a contrary effect with his imitators. The faults of his style are frequent inequalities: a sublime passage is followed by lines of a very inferior description, and his imagination hurried him away to the neglect of the rules of art and good taste. Although he flattered the monarch in his poems, many of them contain very bold truths. The most remarkable productions of Derjavin are his 'Ode to God,' which was translated into several languages; 'To Felitza,' a name under which he addressed Catherine; 'On the Death of Prince Meshcherski;' 'The Cataract;' 'The Autumn,' &c.; and a great number of Anacreontics. He wrote also several prose works, but none of them equal his poetical productions. Several of his poems have been translated into English by Dr. Bowring, in his 'Russian Anthology.'

Basilius Kapnist was born in the Ukraine, of a distinguished family of that province, where he possessed large estates. He received an excellent education, and wrote several compositions of considerable merit when he was very young. The Ukraine, which after its separation from Poland had submitted to Russia, on condition that she should preserve all her privileges, which constituted a kind of self-government under the protection of Russia, gradually lost those rights, and was finally converted by Catherine into a Russian province. On that occasion Kapnist wrote an elegy, entitled 'Slavery,' in which he paints in animated colours the calamities resulting from the loss of liberty. He wrote a great number of poems, but his reputation was established by his comedy entitled 'Yabedniki,' that is, the Chicaneries of Law. In 1823 Kapnist died, at a very advanced age, on his estate in the government of Pultava. Kostroff (died in 1796) translated the 'Iliad,' from the original Greek; the 'Golden Ass' of Apuleius; and the Poems of Ossian. He also made some other translations from the French. Bobroff (died in 1810) became chiefly known by his 'Khersonide, or a Summer Day in the Crimea,' which has been translated into English by Dr. Bowring. His poetic style, formed chiefly from a deep study of the best English authors, has much feeling and animation, but he is frequently obscure, and sometimes degenerates into bombast. Neledinski Meletzki is the author of songs and romances, which are characterised by much tenderness and feeling; they are set to music, and are very popular among the ladies of Russia. Barkoff (died in 1768) translated the 'Epistles' of Horace, the 'Fables' of Phædrus, and many other works. He became universally known by his witty poems, which however are disfigured by extreme licentiousness. Prince Dolgoruki wrote epistles and other poems, in a popular style, on philosophical and moral subjects. His works have gone through several editions, the last of which is that of 1819. Chemnitzer was born at Moscow, of German parents, in 1744. He died in 1784, as Russian consul at Smyrna. He wrote fables, which, owing to their great simplicity and natural ease, have acquired a merited popularity, and continue to be read. Dramatic literature was cultivated chiefly by James Kniajnin (1742-91). His talents were formed under the direction and patronage of Soomarokoff, whose daughter he had married. Kniajnin wrote tragedies, comedies, and operas, besides odes, fables, and other minor poems. His principal productions are—'The Clemency of Titus,' 'Dido,' 'Sophonisba,' 'Roslaf,' 'Vladimirk,' and 'Yaropolt,' &c. Some of them are original; others translations or imitations from foreign authors, particularly from Metastasio. His comedies are—'The Boaster,' 'The Odd Fellows,' &c.; his operas, 'Misfortune from a Coach,' 'The Vender of Sbiten' (a national beverage), 'The Miser,' &c. His style is purer and more elevated than that of Soomarokoff, but it is often constrained, and he offends by a continual attempt to be sublime, which frequently degenerates into bombast. Like Soomarokoff, he is also a servile imitator of the French dramatic school. Some of his comedies, and particularly 'The Boaster,' and 'The Odd Fellows,' are clever. They were however surpassed by those of Von Visin, who was born at Moscow in 1745. He studied at the university of his native town, and travelled in several parts of Europe. His comedy of 'Niedorosl,' that is, the Minor, or the Spoiled Child, is an admirable picture of Russian manners in the eighteenth century, and although those manners are fast disappearing, it is still a very popular play. His other comedy of the same kind, entitled 'The Brigadier,' is also a clever performance. Von Visin translated into verse Voltaire's 'Alzire' and Bitaube's poem of 'Joseph.' He also wrote a poetical epistle, addressed to his servants, of a satirical description, which is very popular: it contains some ideas evidently borrowed from the French philosophy of his time, which the author is said to have afterwards much regretted, on account of the mischief which they might produce by their irreligious tendency. He also published many translations and original compositions, which are now forgotten. He died in 1792.

The study of national history was much advanced during this period by the learned researches of foreigners as well as natives. The learned Schlözer, who came to Russia in 1761, was nominated (1765) professor of history at the Academy of St. Petersburg. He remained there till 1769, when he was appointed professor at Göttingen. During his residence in Russia he learned the Russian language, and published some works relating to the history of that country. He continued his researches on that subject at Göttingen. John Stritter, born in 1740, at Stettin in Pomerania, died in 1801, at Moscow. By order of the Academy of Sciences, he collected according to the plan of Schlözer, from the Byzantine authors, the accounts of the different nations which are connected with the history of Russia: they were published in Latin, under the title of 'Memoriæ Populorum olim ad Danubium, Pontum Euxinum, Paludem Macotidem, Caucasum, Mare Caspium, et inde magis ad Septentrionem Incolentium, à Scriptoribus Historiæ Byzantinæ erutae et digestæ,' 4 vols. large 4to., St. Petersburg, 1771-80, at the expense of the Academy of Sciences. This valuable collection of historical materials was well received by the learned in Europe, and was made use of by Gibbon in his great work. An abridgement of it, made by the author himself, in Latin, was translated into Russian by Srietoff, and published at St. Petersburg (1770-75) in 4 vols. 8vo. Stritter also wrote in Russian a 'History of Russia,' which reached only to the year 1464, and was printed in 3 vols. at St. Petersburg (1800-3), and some historical dissertations also in Russian. Prince Michael Shcherbatoff (born in 1733, died in 1790) from his youth evinced great zeal for the study of national history, and diligently collected materials relating to that subject. The empress Catherine commissioned him to arrange the archives of the cabinet of Peter the Great, and granted him free access to all the libraries and records of the state. He was thus enabled to prosecute his researches for a history of Russia, which appeared in 13 vols. (1770-92), but which reaches only to the reign of the Czar Michael Federovich. It is written in a heavy style, without criticism, and is full of blunders. Many of his errors were pointed out in Boltin's remarks on Lubec's 'History of Russia,' which led to a very angry literary quarrel between Shcherbatoff and Boltin. He was also the author of the following works: 'On the Antient Gradation of Ranks in Russia,' Moscow, 1784; and an 'Historical Account of the Origin of the Russian Princes who are descended from Ruric.' He also edited many important historical documents, such as the 'Diary of Peter the Great.' Boltin (1735-91) contributed by his critical writings to the elucidation of many obscure parts of antient Russian history, although his own writings were not free from error, as was proved by Shcherbatoff. He eft in manuscript several historical and philological works, and a translation of the French Encyclopædia to the letter K. Golikoff (1735-1801) was a merchant, but occupied himself in his leisure hours with literature and history, and particularly with the history of Peter the Great. Being engaged with a cousin in the farming of the government evenue from the sale of ardent spirits, he was guilty of ome irregularities, for which he was condemned to be imprisoned for life. He was however pardoned in consequence of an amnesty granted in 1782, on the occasion of the intallation of the monument of Peter the Great. Golikoff went from his prison straight to the church to thank God or his deliverance, and then to the monument, before which he made a solemn vow to devote the remainder of his life to he glory of the monarch to whom it was erected. He kept his vow, and diligently collected all that was written about Peter the Great in every language, and as he did not undertand any foreign tongue, he got translations made at his own expense. He also visited all the towns where Peter had resided, and collected all the traditions relating to him. Catherine, being informed of his exertions, gave him free access to all the public records. The result of his labours was a work entitled 'Deeds of Peter the Great,' in 12 vols., Moscow, 1788-90; and a continuation of that work in 18 vols., completed in 1798, under the title of 'Supplement to he Deeds of Peter the Great.' He also wrote anecdotes of Peter the Great and the Lives of Lefort and Gordon. These works, although written without any criticism, contain very aluable materials for the history of Peter the Great. Nicholas Novikoff (1744-1818) has done perhaps more than any other individual in Russia for the diffusion of literaure. He edited several periodicals devoted to literature and education, and he collected numerous historical documents, such as relations of Russian ambassadors sent abroad, official instructions given to government agents, eports of governors of provinces, diaries of private persons, &c., which he published under the title of the 'Antient Russian Bibliotheca,' St. Petersburg, 10 vols., 1770-75; and ts continuation in 9 vols., 1786-93. Novikoff established a ociety for publishing useful books at a cheap rate: he hired the printing-office of the university of Moscow, and ntroduced into it many improvements. He had foreign works translated into Russian, established booksellers' shops n provincial towns, and the first circulating library in Russia. These efforts to enlighten his countrymen awakened the suspicion of the government, which, being afraid of the French revolution, became much less liberal in its views than it had been before that event, and Novikoff, being accused of promoting the principles of that revolution, was subiected to a severe persecution. His innocence was however recognised under the emperor Paul, who generously rewarded Novikoff for his sufferings. Sergius Pleshcheyeff (1752-1802) was educated in England, and served in the Russian fleet during the campaign against the Turks in 1770 and the following years; passed into the civil service, and rose to the rank of a privy-councillor. Pleshcheyeff wrote the first statistical account of Russia, which was published in 1790, and translated into several languages; and the 'Diary of a Naval Expedition to Syria,' which was sent to assist, against the Turks, the celebrated Ali Bey, who had usurped the government of Egypt. Two French authors have written on the history of Russia, Levesque and Leclerc, both of whom resided in Russia and were conversant with the language, but their works belong rather to French than Russian literature.

The mathematical sciences and natural philosophy were cultivated with considerable success by several members of the Academy of Sciences. Roomovski, born in 1734, of poor parents, learnt mathematics under Euler. He was sent to Selenghinsk (on the frontiers of China) to observe the passage of Venus over the sun's disk, and afterwards made a journey for a similar purpose to Kola in Lapland. He was appointed professor of astronomy to the Academy of Sciences, and successively honoured with other duties connected with public education. Finally he was created in 1803 curator or supreme director of the university of Kazan. He died in 1812. Roomovski was the first who wrote a mathematical school-book in Russian, which appeared in 1760; and he also published translations of Euler's letters on different philosophical subjects, and of the 'Annals' of Tacitus. John Lepechin (1739-1802) studied at St. Petersburg and afterwards at Strasburg, where he took the degree of doctor of medicine. He undertook scientific journeys in several provinces of the Russian empire. His principal work is 'Diary of my Voyage in several Provinces of Russia,' St. Petersburg, 1771-80. He also wrote some minor works on subjects of medicine and rural economy. Nicholas Richkoff (died in 1780) published a 'Diary of Travels in different parts of Russia,' chiefly Asiatic, in the years 1768-71, 3 vols., St. Petersburg, 1772. Oseretzkovski published 'Travels on the Lakes of Ladoga and Onega,' and some other minor works. There were also many learned foreigners employed by the government in scientific travels in Russia.

The eloquence of the pulpit was chiefly cultivated during this reign by Platon Lefshin, metropolitan of Moscow (1737-1812). This learned prelate wrote many sermons, several theological works, and an abridged history of the Russian church. Athanasius, archbishop of Astrakhan, and John Levanda, Archiyerey of Kieff, were distinguished as writers of sermons. The national theatre received a new impulse. It was rendered a public amusement to which every one had admission by paying, whilst formerly it had been exclusively reserved for the court and the upper classes, who received free admission to places, distributed according to their respective ranks. A great number of periodicals appeared during the same period.

The reign of the emperor Paul was distinguished by the foundation of the university of Dorpat, and the agricultural school, the school for military orphans, the institute of the order of St. Catherine for the education of girls, and the placing of all the female educational institutions under the superintendence of the empress Maria, under whose care they remained till her death, and acquired a high degree of prosperity. The emperor Alexander gave a great impulse to the literature, learning, and public education of his country. By his order a new ministry of public education was established in 1802, and intrusted with the supreme direction of all the educational institutions in Russia, with the exception of the ecclesiastical, military, naval, and mining schools. Immediately after its establishment this ministry formed a general plan of public education for Russia, which was approved by the emperor. In consequence of that plan all the Russian dominions were divided into the six following educational districts, viz.: 1, Moscow; 2, St. Petersburg; 3, Vilna; 4, Dorpat; 5, Kazan; 6, Kharkoff · each of these districts had a university, and consequently two new ones, those of Kharkoff and Kazan, were established in 1804-5. The universities were intrusted with the organization and direction of all the schools in their respective districts. A gymnasium, or higher school preparatory for the university, was established in every government; and a school preparatory to the gymnasium, in every circle, besides many primary or parochial schools. The instruction in the university of Dorpat and its department is given in German, which is the official language of the Baltic provinces comprehended in that department. Polish was left to the university of Vilna and its department, which extended over all the provinces dismembered from Poland.

Besides the schools established in consequence of the general plan of public education, many other important institutions of that kind were founded in several parts of Russia; such as the Lyceum at Tzarskoye Selo, in 1811, which has produced several distinguished authors of the present day; the Lycée Richelieu, at Odessa, in 1817; the gymnasium of Yaroslaf, founded by Demidoff in 1805; the Lyceum of Krzemieniec in Volhynia; and some commercial schools, &c. A great number of learned and literary societies were also established in the capitals and other towns of Russia.

The Russian language, which had made great progress in the last ten years of the eighteenth century, attained under this reign a high degree of perfection. Its prose was chiefly formed by the writings of Karamsin, who began to replace the Latin and German construction into which the Russian authors had generally forced their national language, by periods approaching more to the French. But although his style is far more easy and agreeable than that of his predecessors, it often contains foreign turns, and the style of the school of imitators which he created was corrupted by so many Gallicisms, that it frequently appeared to be French written with Russian words. A reaction was produced, chiefly by the work of Admiral Shishkoff, on the antient and modern Russian style, in which he violently attacked those absurd innovations; but although there is much sound criticism in his observations, his zeal for the purity of the national language is sometimes extravagant. This work, which caused a great sensation, created two opposite parties in Russian literature—that of Moscow, which consisted of Karamsin's imitators, and that of St. Petersburg, which adhered to the ideas of Shishkoff, and the animated contest which has been carried on between them has greatly contributed to the improvement of the Russian style. The school of Karamsin became purified from its foreign idioms; and even the style of its founder, in his great work the 'History of Russia,' is far superior to his early productions. The labours of the Russian Academy, which was re-organized in 1816, have also tended to improve the language, the rules of which are determined by the grammar of that Academy, published for the last time in 1802. The imperial manifestoes and other public documents of importance issued since the accession of the emperor Alexander are written in a very good style.

John Dmitrieff (born in 1760) has done almost as much for Russian poetry as Karamsin did for prose. Dmitrieff began at an early age to write poems, several of which were printed in the 'Literary Journal of Moscow,' 1792 and 1793. His works, consisting of odes, epistles, satires, tales, epigrams, &c., have gone through several editions; they are written with great ease and elegance, are full of genuine wit, fine feeling, and good sense expressed in a very happy manner. His life was spent in public service, and he was minister of justice under the emperor Alexander.

Vladislaf Oseroff, a general officer (1770-1816), created by his tragedies a new æra in the dramatic literature of Russia, and threw into the shade all the dramatists who preceded him. Yet although his productions rise immeasurably above those of Soomarokoff and Kniajnin in artistic skill, animation and truth, and situations of high tragical interest, his versification is far from being perfect; it wants ease and harmony, and the structure is too artificial. Oseroff is still the first tragic writer in Russia, and a contemporary writer said that tragedy was born and died in Russia with Oseroff: his chief productions are—'Œdipus in Athens,' 'Demetrius Donskoy,' and 'Polyxena.'

John Kriloff (born in 1768), librarian of the Imperial library at St. Petersburg, is the author of several successful comedies, but his literary reputation rests on his fables, which rival those of La Fontaine, and display all the 'bonhommie' of the French fabulist. They have passed through several editions, and a splendid edition, with a French and Italian translation, was published by Count Orloff, at Paris, in 1825.

Nicholas Gnedich (born in 1784) is the author of a very successful translation, in hexameter verse, of the 'Iliad.' He also translated several tragedies from modern authors, of which Shakespere's 'King Lear' is the most remarkable.

Prince Peter Viazemski (born in 1792) occupies a distinguished place among Russian authors by his epistles and satirical poems, which are written in elegant verse, and display much imagination and true feeling. The few literary essays which he wrote in prose are among the best in the Russian literature. Viazemski lived for some time at Warsaw as a Russian employé. He became intimate with the first literary persons of Poland, and in conjunction with several of them formed a plan for establishing a connection between the Polish and Russian literature by means of reciprocal translations. Circumstances however prevented the execution of this project.

Prince Alexander Shakhovskoy (born in 1771) made metrical versions of several tragedies from the French, and wrote, both in verse and prose, a great number of comedies and vaudevilles, many of which are very popular.

Alexander Pushkin is undoubtedly the first poet of Russia: his character has been given in another place. [PUSHKIN.]

Pushkin was, on his mother's side, grandson of a black called Annibal, who was the son of a groom of Peter the Great, and rose in the Russian service to the rank of a lieutenant-general of engineers. Pushkin, who, with a white complexion, had the features of a negro, was proud of his African origin, and frequently made allusion to it in his poems.

Basilius Jookowski (born in 1783) was educated at Moscow. He was employed in a department of the civil service, but in 1812 he entered the army as a volunteer. He was afterwards appointed professor of Russian literature at the university of Dorpat; then nominated teacher of the Russian language to the grand-duchess, the present empress; poet-laureate, and finally tutor to the grand-duke Alexander, crown-prince of Russia. His poetical reputation was established chiefly by a very successful imitation of the German ballad of 'Leonora,' by Bürger. He translated with equal success several poems from the German, French, and English, and among them Gray's 'Elegy in a Country Churchyard,' Schiller's 'Jeanne d'Arc,' and Byron's 'Prisoner of Chillon.' His original poem, the 'Bard in the Camp of the Russian Warriors,' which he wrote during the campaign of 1812, amidst the turmoil of warfare, presents an animated picture of the life of a camp, and contains some passages of wild and original poetry. Jookowski has also earned the reputation of being one of the best Russian prose writers by his tale called the 'Wood of Mary,' and his translation of 'Don Quixote.' As a translator Jookowski is unrivalled: he adapts his style to that of the original in such a manner that each of his translations appears to have been made by a different person. Notwithstanding the favours of the court, which had been poured upon him, Jookowski preserved great simplicity of manners, and that kindness of heart which induced his friends, before he had become the favourite of fortune, to inscribe under his portrait the following line of Gray—

> 'He gave to misery all he had—a tear,'

taken from his own translation of the poem.

Constantine Batiooshkoff, born at Vologda in 1787, was educated in a private school at St. Petersburg, and served in the army in 1806-9. The severe wounds which he had received induced him to leave the service after the peace with Sweden in 1809; but he re-entered the army in 1812, and left it again in 1816. He was employed in 1818 at the Russian embassy at Naples. Soon afterwards he was attacked by a fit of melancholy, which baffled all medical skill: he tried in vain to counterbalance the effects of the malady by study and literary occupation. When he returned to St. Petersburg, his friends endeavoured to surprise him, by singing one of his finest compositions, accompanied by the harp. This produced a powerful effect on Batiooshkoff, but the contrary of that which was expected; for his mind, instead of recovering, was completely destroyed. In 1836 he was still alive, but in a state of insanity. Batiooshkoff's talent was formed chiefly by the literature of Italy, which he studied and distinguished from his early youth. His poetry is distinguished by the great finish of his verses and their harmony, which sometimes remind one of the Italian language. No Russian author has shown so much delicacy, precision, and expressiveness of language as Batiushkoff, both in poetry and in prose. His chief productions are—'The Dying Tasso,' an elegy, which may be considered the most classical production in the Russian language, by the depth and truth of feeling, and the eminent art of the composition. All his poetical productions have an elegiac character. He did not compose much; the best of his writings, besides that which we have mentioned, are the 'Russian Captive,' and the 'Phantom,' imitated from the French of Parny. His prose writings, on different literary subjects, are marked by talent and a moral tendency.

John Kozloff, born in 1780, received a good education, and spent a great part of his life among the fashionable circles of Moscow and St. Petersburg; when about forty years of age a severe illness deprived him of the use of his legs, and his consequent retirement from the world directed his mind to literary occupations and developed his talents. Kozloff was already thoroughly acquainted with the languages and literature of France and Italy, and he now devoted himself to the study of English literature. He was doomed to a still severer trial by the loss of his sight. Yet this accumulation of misfortune broke not his spirit, but rather developed his poetical genius. He learnt German, notwithstanding his blindness, in a very short time. His memory was so powerful that he retained all that he ever read; and he translated Byron's 'Bride of Abydos' from memory. He composed and translated many small poems, which are characterised by an extraordinary harmony of versification; the most remarkable are 'The Monk' and 'The Venetian Night.'

Alexander Voyeykoff, born in 1779, translated Virgil, and several poems of De Lille, and wrote a descriptive poem entitled 'Arts and Sciences,' as well as satires, epistles, and other minor poems. He is also known as one of the first literary critics in Russia.

Dionysius Davidoff, a general officer of cavalry, who distinguished himself in the partisan or guerilla warfare during the campaigns of 1812-14, is the author of many fine poems, which being generally written in the midst of the occupation of war, have something inimitably wild and original. Baron Delvig died very young, but left some beautiful songs, and the first attempt towards a history of the arts in Russia. Anna Bunin, born in 1774, in the government of Riazan, received a scanty education, but a natural love for literature overcame all the difficulties of her situation. She was 27 years old when she came to St. Petersburg, where she began diligently to study French, German, and English, as well as mathematics and Russian literature. She soon expended her little means of subsistence; but her first poetical essays, entitled 'The Inexperienced Muse,' were favourably received by the empress Elizabeth, the wife of Alexander, who granted her a small pension; and the poems which she published subsequently obtained such success as to give her competence and reputation. She had the misfortune to be attacked by cancer, which resisted the skill of the best physicians. Supported by the bounty of the emperor Alexander, she came in 1815 to England for medical advice, but without deriving any benefit from it. She returned, after a residence of two years in England, to St. Petersburg, where she continued to linger till death released her from her sufferings, which had lasted seventeen years. Although she was prevented by illness from actively pursuing her literary occupations, she translated twenty of Blair's 'Sermons.'

Among the remaining poets of the present period we may mention Panayeff, author of eclogues; Krukofski, author of some tragedies; Raich; Katenin; and Viskovatoff, the translator of several foreign poems. We shall conclude with one who became celebrated by his talents, his daring spirit, and his tragical end.

Rileyeff acquired great celebrity in Russia and abroad as the chief promoter of the conspiracy against the present form of government in Russia, which ended in a fruitless attempt on the accession of the present emperor, in the beginning of the year 1826. Rileyeff was first known by translating from the Polish some of the historical ballads of Niemcewicz, and he also wrote similar compositions on subjects from Russian history. All these poems, like those of Niemcewicz, are animated by a patriotic and liberal spirit. Rileyeff developed his political views chiefly in his poems 'Woynarowski' and 'Nalevayko.' The first is a history of a chief of the Ukraine, nephew of the celebrated Mazeppa, who, while an exile in Siberia for his share in the attempt of his uncle to liberate, with the assistance of Charles XII., the Ukraine from the oppression of the Czar, relates his adventures to the German Müller, who met with him during his travels in Siberia. The most daring opinions expressed in beautiful verses are put into the mouth of the hero of the tale, although they are accompanied with notes condemnatory of them, or explaining them to be harmless, in order that permission to print them might be obtained from the censors, a stratagem which had the desired effect. The other poem 'Nalevayko' is the history of a hetman of the Ukraine, who was beheaded at Warsaw for a revolt against the Polish dominion. Only fragments of it appeared in the 'Northern Star,' an annual edited by the author and Bestujeff. The most striking is the confession which Nalevayko makes to a priest before raising the standard of insurrection, and the author has predicted his own fate, in an answer which Nalevayko gives to the priest, who represents to him the danger of his enterprise. His answer is as follows, expressed in beautiful verse: 'I know that peril awaits him who first rises against the oppressors of the people. Fate has already devoted me, but say when and where was freedom attained without sacrifices? I know that I shall perish for my native land, and I bless with joy my destiny.'

Rileyeff displayed during his imprisonment and trial, as well as at his execution, a firmness of character which inspired his judges with respect; and he was, according to universal opinion, a victim to his sincere convictions. He was executed in July, 1826, with four other leaders in the conspiracy.

Admiral Shishkoff, who was also president of the Russian Academy, and minister of public education, was distinguished as a prose writer. Besides the dissertation on the old and new Russian style, which has been already mentioned, he was the author of various literary works, and several relating to nautical science.

Alexis Merzlakoff, professor of literature at the university of Moscow, is undoubtedly the first literary critic in Russia. He has translated several works relating to the theory of literature, and has written original works on the same subject. The most remarkable are his lectures on literature, which were delivered at Moscow.

Alexander Vostokoff is the author of a Slavonian grammar, and a dissertation on that tongue, which have gained him the reputation of being the first Slavonian scholar in Europe.

Nicholas Grech is the author of a course of Russian literature, a Russian grammar, and a great number of minor compositions, which are inserted in the periodicals, 'The Northern Bee,' and 'The Son of the Fatherland,' which he had edited; he is now one of the first critics in Russia.

Thaddeus Bulgarin, born in 1789, of an antient family in Lithuania, was educated at the military school of St. Petersburg. He served in the Russian guards during the French and Swedish wars; but in 1810 he left the Russian service, and having entered the Polish army of the grand-duchy of Warsaw, he joined the French armies in the campaigns of Spain, Germany, and France, till the peace of 1814. On his return to his native land, he published several compositions in the Polish language, but having gone to St. Petersburg on account of some law business of his family, he was induced by some of his early friends to try his talents in the field of Russian literature. His first attempts were successful, and he established, in 1823, a periodical called the 'Northern Archives,' which contained essays, historical, geographical, and statistical, and continued many years with great success. He is best known by his novel 'Vejighin, or the Russian Gil Blas,' which is a satire on Russian manners; but his pictures, although cleverly drawn, are often overcharged: it has been translated into several languages, and into English. 'The False Demetrius,' an historical novel, contains many good pictures of the manners and customs of Russia and Poland at the beginning of the seventeenth century, and several well-drawn characters; but there is perhaps too much of pure historical narration. Besides 'Mazeppa,' an historical novel, he has published Memoirs of his campaigns in Spain, a large work on Russia, its geography, statistics, history, and literature, and many minor compositions. His works are characterised by great talent of observation, and much wit; and his style is excellent.

Alexander Bestujeff (born in 1795) was educated in a military school, and served as an officer in the life-guards. Being implicated in the conspiracy of Rileyeff, he was degraded to the rank of a common soldier, and sent into the interior of Siberia. He was seen there by the German traveller Ermann, to whom he addressed, in French, an exceedingly clever letter, which contributed to obtain his pardon, and he was sent as an officer to the army of the Caucasus, where he was killed, in 1837, in a skirmish with the Circassians. Before his exile Bestujeff edited, with Rileyeff, the first Russian annual, entitled the 'Northern Star,' in which he wrote a very clever sketch of contemporary Russian literature, and several little novels. After he was pardoned, he wrote several novels under the name of Marlinski. In these works he displayed an uncommon talent in describing romantic scenes of a wild character, a power which was developed by the excitement of a constant warfare with the Caucasian mountaineers, in which he spent the last years of his life. His last work is 'Amaleth Beg,' a novel, containing the story of a Circassian chief, and animated sketches of Caucasian scenery. The best Russian novelist is undoubtedly Zagoskin, whose works belong to that branch of the novel to which Scott has given celebrity. His 'Youri Miloslavski, or Russia in 1612,' which has been translated into English, contains an admirable picture of Russian manners in those troubled times, and some exceedingly well sketched characters. His 'Roslavleff, or Russia in 1812,' is considered inferior to the other work: perhaps being obliged to describe scenes relating to a modern event of so much importance, he could not free himself entirely from many personal considerations. The other novelists of Russia are Ooshakoff, Dahl, Prince Odoyevski, Baron Korf, and Massalski, who also has written in Polish. The Russian literature is very rich in translations of foreign novels.

The present literature of Russia is producing many historical works. Ustrialoff has written, by order of the government, a history of Russia for the use of schools. It is certainly an able production, but the fairness of its views may be doubted, as it is a kind of defence of the successive usurpations of Russia on Poland. Polevoy, a merchant of Moscow, published a history of Russia, in which he attacked many of the views that were adopted by Karamsin. Polevoy is well known as the successful editor of a literary periodical called the 'Telegraph.' Polgodin has made some valuable researches into the period of the false Demetrius, the Annals of Plescov, &c.

Berg (died in 1834) published a history of the reign of Michael Federovich (1832), of Alexey Michaelovich (1834), and of Fedor Alexeyevich (1835). Several other special histories relating to Russia have been recently published. The campaigns against the French and the Turks have furnished materials for several works, among which there is one on the war of 1812-14, which was written by a female who had served in that war. Great attention is now paid in Russia to the collecting of materials relating to the national history. A systematic collection of various accounts of Russia, by Artzibashoff, is now publishing at Moscow. A similar work, under the title of the 'Library of Foreign Authors who have written on Russia,' was begun, in 1837, at St. Petersburg, by Semenoff, who promises to furnish the translation of one hundred foreign works on Russia. Several learned men have made successful researches in foreign countries relating to Russian history. Many works on the geography and statistics of Russia have lately been published. The most important of these are—the 'Military Geography of Russia,' by Yasikoff, 1838; 'Contributions to the Knowledge of the Russian Empire and the adjacent Countries of Asia,' is a very interesting work, which was commenced by the Academy of Sciences in 1830, and two volumes have appeared. The work on the Caucasian provinces, by Chopin, 1840, gives many new details on those countries. Many travels in different parts of Russia, as well as abroad, have been recently published.

The study of the Oriental languages is much encouraged in Russia. Besides the Oriental Institute at St. Petersburg, where all the principal languages of the East are taught, and which possesses a splendid Oriental library, numismatic cabinet, and a printing establishment for Oriental publications, there are chairs of Arabic, Persian, and Turkish in all the Russian universities. The university of Cazan, being situated in a country partly inhabited by a Mohammedan population, and having a great intercourse with the East, is specially endowed with the means requisite for Oriental studies. There are chairs of the Arabic,* Persian, Turkish, Chinese, Mongol, Armenian, and Tibetan languages, as well as rich collections of Oriental books, manuscripts, and coins. There is also a printing-press for Oriental works, whence the celebrated 'History of the Tartars,' by Abulgazi Khan, and other important works, have issued. The same university has a stipend for fourteen scholars, who devote themselves exclusively to the study of Oriental languages. The ecclesiastical seminary of Irkutsk has a separate class for missionaries among the Mongolian tribes. Japanese is taught in the gymnasium of the same town, and a special school for the Chinese was established in 1835, at Kiakhta.

Joseph Senkowski, a Pole, having completed his education at the university of Vilna, studied the Oriental languages at Constantinople and in Syria, where he resided for some time among the Maronite Christians. Senkowski is one of the most remarkable linguists of his time; he possesses not only a great knowledge of the languages of the East, but also a great familiarity with those of the West; he has published several well written things in the Polish (which is his native language), the Russian, and the French. He is now the chief editor of the 'Encyclopædical Dictionary,' to which he has contributed many valuable articles on Oriental subjects. His works display great learning, and a lively although somewhat satirical humour. Kowalewski, also a Pole, and a pupil of the university of Vilna, is now professor at Cazan. He is distinguished by his great knowledge of the Mongol languages, which he studied for several years among the native populations. He published, in 1838, very valuable extracts from the Mongol literature. The most eminent Chinese scholar of Russia is father Hyacinthus Bichoorin, who was for seven years a pupil of the Russian mission at Pekin, and subsequently for seven other years at the head of that mission. His principal works are—'Researches on Mongolia;' a 'History of the Calmucks,' 1834; and his 'Chinese Grammar,' which is considered to be the best that exists. There are also several foreign Orientalists of great eminence employed in Russia. Many scientific works have been recently published, and an 'Encyclopædical Dictionary' has been commenced. This work seems to have been formed on too extensive a plan, as the fifteenth volume (thick 8vo., printed with small type in double columns) has only reached the beginning of the letter D, the fifth in the Russian alphabet. It contains many well written articles, particularly on Slavonian and Oriental subjects. It contains the most minute details relating to Russia, but many of the geographical articles are too elaborate for a work intended to be popular. This work when completed will make about fifty volumes. The publication has been suspended, owing to the failure of the publisher.

In 1839 there were fifty-three Russian newspapers and periodicals, many of which were devoted to literature and science in general, as well as some special branches, as, for instance, military art, agriculture, technology, mining, &c.

The tendency of the present government is decidedly to destroy the provincial characteristics which are preserved in different parts of the Russian empire, and which had been respected under preceding reigns. We have in another place described the efforts of the Russian government to destroy the Polish language. [POLISH LITERATURE.]

The German nationality of the Baltic provinces (Livonia, Esthonia, and Courland) had been scrupulously respected since their incorporation with Russia. All the official transactions were in German, and the public education, which was under the superintendence of the university of Dorpat, was conducted in the same language, whilst the Russian was only taught like any other foreign language. These privileges are now beginning to be gradually undermined by successive enactments respecting the public education in the Baltic provinces. Not only the acquisition of the Russian language has been imposed on all the pupils in the public schools, but no one can be admitted as a teacher in these schools who cannot show his ability in the Russian language; and those teachers who are already employed are enjoined to acquire a competent knowledge of the Russian.

An Imperial ukase has decreed that from the 10th of December, 1845, no academical degrees shall be conferred by the university of Dorpat on individuals who shall not be able to show in a strict examination a complete knowledge of the Russian language. These measures are evidently preparatory steps for replacing the German language by the Russian in the public schools of the Baltic provinces.

---

* A Koran was printed in Arabic at St. Petersburg about the year 1820.

Many new regulations respecting the admission of pupils belonging to the different ranks of society have been lately introduced, and the admission of serfs to the higher schools is strictly prohibited unless they have been previously emancipated.

Polish Language and Literature.—The Polish language is considered to be more flexible and euphonic than the other Slavonian dialects. In conciseness of expression it can scarcely be surpassed by any other language. The nouns have a declension of seven cases, and the verb is equally well developed. The verb also has some delicate shades of distinction as to tenses and genders which do not exist in the Teutonic or Romanic languages. The juxtaposition of numerous consonants gives the language an appearance of harshness, but the consonants are softened in the pronunciation by melting them together. The Polish is the only Slavonian language which contains the nasal sounds like the French *an*, *on*, *in*, which are represented by the letters ą and ę, undermarked with a ,. The Polish language can imitate with great ease the beauties of classical prose, but it has not the same facilities for poetry, as all the words have the accent on the penultimate syllable. It seems to have separated at an early period from the other Slavonian dialects, and owing to the predominance of Latin since the introduction of Christianity, its forms have been moulded into those of that language, although its original purity was not affected by the admixture of foreign words, except in the transient period of a corrupted taste. Of all the Slavonian dialects it comes nearest to the Bohemian language.

Literature.—Learning was introduced into Poland by Christian missionaries, and particularly by Benedictine monks. During the middle ages there were parochial schools in Poland, and the statute of the archbishop of Gnesen, A.D. 1237, ordered that no German masters should teach Latin in those schools, unless they knew Polish. The earliest literary productions that have come down to us are chronicles; and the earliest known annalist is the biographer of St. Adalbert, who is mentioned by Martinus Gallus. Gallus wrote his chronicle between 1110-1135, and is supposed to have been a Frenchman who had settled in Poland. Mathias, bishop of Cracow (died in 1166), wrote a chronicle, which was used in the composition of the Annals by Vincent Kadlubek, also a bishop of Cracow, who died in 1223. Boguchwal, bishop of Posnania (died in 1253), wrote the Annals of Poland to the year 1249, which were continued by Basko Custos, of the same town, to the year 1273. There are several other annalists of the thirteenth and fourteenth century, but the most celebrated Polish author of that period is the well known Martinus Polonus, whose family name was Strzempski; he is the author of a chronicle of the popes and emperors. He was a Dominican monk, confessor to the pope, and was nominated archbishop of Gnesen, but died on his way to Poland at Bologna, in 1279. All these chronicles were in Latin. The most ancient monument of the Polish language is a hymn to the holy Virgin, attributed to Saint Adalbert (died in 997). Dr. Bowring has given a translation of it in his specimens of the Polish poets. Some other songs and hymns belong to the same epoch. Vitellio, a Pole, about 1269, wrote a treatise on optics. At an early period the Poles resorted to the foreign universities, and chiefly to Paris and Padua. Casimir the Great laid the foundation of a university at Cracow in 1347, but it seems to have completely fallen into decay during the reign of Louis of Hungary (1370-82). In 1400, Vladislav Jagellon founded, according to the last will of his queen Hedvige, a university at Cracow. This learned establishment, which was honoured with the name of the 'daughter of the Sorbonne,' was at first engaged in teaching divinity and scholastic philosophy; classical learning began to flourish there only in the latter part of the fifteenth century. Gregorius of Sanok, who afterwards died in 1477, as archbishop of Lemberg, first explained the text of Virgil. He also boldly attacked the scholastical philosophy, which he called 'somnia vigilantium.' John of Glogow (died in 1507), a professor and rector of Cracow*, became known through Europe by his works on different parts of the Aristotelian philosophy. He also attempted to establish a system of phrenology. His work 'Quaestiones Librorum de Anima,' printed at Metz in Lorraine, 1501, contains the figure of a head with points indicating the seats of the various intellectual powers. He divides the brain into three compartments, 'the front, the middle, and the back,' each of which is supposed to be the seat of different faculties, as apprehension, imagination, judgment, memory, &c. He admits however the existence of an immaterial intellect, or virtus divina, whilst the other faculties depend on material organs. A treatise by him, 'De Arte Memorativa,' was published at Cracow, 1504. John Stobnicki, who succeeded John of Glogow in the chair of philosophy, published several treatises on metaphysics, and natural and moral philosophy, as well as on geography. Brudzewski, professor of mathematics at Cracow, published several works on astronomy before the year 1500, and had the honour of being the instructor of Copernicus. James of Kobylin, one of Brudzewski's disciples, wrote a work, celebrated in its time, entitled 'Declaratio Astrologiae,' and Martin of Olkusz, who terminated his studies at Cracow, 1459, became afterwards physician and astrologer of Mathias Corvinus, king of Hungary, and assisted Regiomontanus in the composition of his 'Tabulae Directionum Planetarum.'

King Casimir Jagellon (1445-1492) determined that every superior magistrate should be conversant with Latin and the sciences of that time. He intrusted the education of his children to Dlugosz, who may be considered as the first historian of Poland (1415-80). He was a man of great learning and superior talents, which is proved by the numerous diplomatic missions in which he was employed. He collected the ancient chronicles, and formed of them a whole system of history, supplying their deficiencies from different public and private records. His work reaches to the year 1480, in which he died, and it becomes much more detailed and displays better judgment towards the end than in the early part. His Latin is not better than that which generally prevailed at that period. As a proof of his industry we may mention that he learned Russian at an advanced age, in order to profit by the chronicles written in that language. He tells us with sincerity what he believes to be the truth, without sparing the clergy, and this is supposed to be reason why his work was printed so late (1615): it has been reprinted many times. After Dlugosz's death the education of the royal princes was continued by the Italian scholar Buonacorsi, better known under the name of Callimachus Experiens, who published some works in his adopted country.

Augustan Era of Polish Literature.—The brilliant era of Polish literature begins with the sixteenth century and extends to the early part of the seventeenth: it may be considered as commencing with the accession of Sigismund I., in 1506. It was during this reign that the human mind received a new impulse from the Reformation, and the translation of the Bible tended in Poland, as well as elsewhere, to improve the national language. Poland was well prepared for this revolution by the Hussite doctrines which had circulated there widely during the preceding century. Sigismund I. was of a tolerant disposition, and his answer to Eckius, the antagonist of Luther, who had sent him the book of Henry VIII. against that reformer, 'Permitte mihi aviam et hircorum rex esse,' shows his opinion on this then all-engrossing subject. By an ordinance in 1539 he established the liberty of the press, but this permission was only required for the royal towns, as the privileges of the nobles prevented the king and the clergy from interfering with anything on their own estates. These privileges, which paralysed the power of the clergy, facilitated the diffusion of the Reformation, as every noble who had embraced its doctrines gave the Roman Catholic church to a Protestant minister. Under the reign of his son and successor Sigismund Augustus, Protestantism made further progress, and the states, which assembled after his death in 1573, acknowledged the perfect equality of all Christian confessions.

The translation of the Scriptures into the vernacular languages was the first general consequence of the Reformation, and Poland was no exception to this universal rule. Not only did Protestants make great efforts to spread the Scriptures, but the Roman Catholics, in order to counterbalance the influence of the Protestant versions, published their own. The first translation of the Scriptures into Polish was the New Testament, by Seklucyan, a Lutheran version, published in 1552 at Königsberg. It was followed by the

---

* For some time it was customary to choose [illegible] from the professors of the university of Cracow, a circumstance which [illegible] the Polish prelates [illegible] for their learning, and several of them distinguished themselves [illegible] of the council of Constance (1414-1418). Zbigniew, bishop of Cracow (1423 to 1455), was celebrated for his learning, and [illegible] by Aeneas Sylvius Piccolomini, afterwards Pope Pius II.

New Testament of Scharfenberger, a Roman Catholic version, Cracow, 1556; in 1561 appeared a Roman Catholic version of the whole Bible by John Leopolita, and in 1563 a Protestant version was published at Brest in Lithuania; this last-mentioned Bible, being published at the expense of Prince Radziwill, is also known under the name of the 'Radziwillian Bible.' In 1566 a Socinian version of the New Testament, by Falconius, appeared at Brest; and in 1572 a version of the whole Bible at Zaslav in Lithuania, by Budny, a Socinian; this latter translation is considered exceedingly correct, but the notes which Budny added were of such a character that he was expelled by the Socinians from their congregation as an infidel. In 1577 there appeared at Rakow a New Testament, by Czechowicz, a Socinian; in 1599, at Cracow, the Bible, by Wujek, a Jesuit—this edition, which was accompanied by a copious commentary, is considered canonical. In 1606 appeared at Rakow a New Testament by Smalcius, a Socinian; in 1617, at Cracow, the Bible, by Justus Rabe, a Jesuit; and in 1632, at Danzig, the Bible, by Paliurus, a Protestant. Thus Poland has eleven versions of the Bible and New Testament, which together have gone through more than forty editions. The chief productions of that period were polemical writings, which, although they did not immediately promote the national literature, contributed greatly to the general diffusion of knowledge by obliging the authors of those writings to severe study in order to answer the attacks of their antagonists.

Schools were also generally established by the Protestants; but the most celebrated was that of Rakow, a Socinian academy, which was attended by students of different confessions, and had a reputation all through Europe. The principal theological authors of that period among the Roman Catholics are, Hosius, Novicampianus (Nowopolski), Kuczborski, but particularly the Jesuit Skarga, the most eloquent preacher of that country, and the author of several works against the Protestants, and Sawicki, also a Jesuit, who wrote under the assumed name of Cichovius. Among the Protestants, there were Turnowski, Gregory of Zarnowietz, Dambrowski, Volanus, and John Laski or Alasco, who was invited by Cranmer to assist at the Reformation of the Anglican church.

The national language, having received a new impulse from the translation of the Scriptures, began to be generally cultivated. The first compositions were spiritual hymns and polemical and religious works. Nicholas Rey (1515-1568), having become a zealous Protestant, published a translation of the Psalms, a Postilla or explanation of several parts of the Scriptures, and other works of a religious as well as purely literary character; his style is now obsolete. John Kochanowski (1530-1584) received a superior education at Padua and Paris. On his return to his native country he was much patronised by the king and the first grandees: he rejected all the brilliant offers of preferment both in the church and in civil employment, and settling on his paternal estate, devoted himself to literature. His poetry is still classical, and it breathes a particular sweetness.* He translated the Psalms, the 'Phænomena' of Aratus, the third book of the 'Iliad,' and Vida's poem on Chess. Among his original productions several lyrical poems, but particularly his elegiac lines on the death of his young daughter, are beautiful. He wrote several occasional poems, satires, and the first drama in Polish, on the Greek model, with chorusses. The subject was the dismissal of the Greek ambassadors who came to claim Helena from the Trojans. He also wrote various fragments in prose, and four books of Latin elegies, as well as other poems in the same language, all of which are much admired. His brother Andrew Kochanowski translated the 'Æneid,' which was published in 1590; and Peter Kochanowski made a translation of the 'Gierusalemme Liberata' of Tasso, and the 'Orlando' of Ariosto. Szarzynski, a young man (died in 1581), who left some sonnets, hymns, and a translation of a few Psalms, is only second to Kochanowski. Valentine Brzozowski, a Protestant clergyman, published (1554) the first Polish collection of sacred hymns set to music. Mathias Rybinski, also a Protestant clergyman, published a translation of the Psalms which was adopted by the Protestant congregations of Poland. His son John Rybinski wrote some beautiful descriptive poems, one of which is 'Spring.' Zbylitowski was the author of the 'Village,' a didactic poem on rural economy, besides other productions chiefly of a satirical character. Grochowski, Miaskowski, and Klonowicz, are renowned for the beauty of their verses. Szymonowicz or Simonides, who belonged to a burgher family of Leopol (1558), distinguished himself not only by his beautiful Polish eclogues, but acquired a European reputation by his Latin poems. Justus Lipsius called him the Catullus of Poland. From his youth he was known to the great Zamoyski, who attached him to his person, made him the tutor of his son, and liberally provided for his support. Pope Clement VIII., who had been nuncio in Poland, held him in great esteem, and conferred on him the honour of a laurel wreath. His earliest works have gone through several editions; his Latin poems were collected and published at Warsaw in 1772, by the papal nuncio in Poland, Angelo Durini, who bestows on him the appellation of the Latin Pindar. Zimorowicz (died in 1624, at the early age of 25) translated Moschus, and wrote several original idyls. We may add to the Bucolic poets of that time Gawinski and Chelchowski.

The Latin poets of that period, besides J. Kochanowski and Simonides, are the following:—Krzycki, archbishop of Gnezno, and primate of Poland, distinguished himself in diplomacy; and when king Sigismund I. acknowledged as sovereign duke of Prussia, under the suzerainty of Poland, Albert of Brandenburg, the last grand-master of the Teutonic order, who had become a Protestant, Krzycki wrote a pamphlet in defence of that transaction, which was the first legal recognition of the secularization of a Roman Catholic religious order by its conversion to Protestantism. It was therefore no wonder that the clergy said that his pamphlet was more politic than Catholic. Krzycki corresponded with many eminent scholars of his time, but particularly with Erasmus, who bestowed extraordinary praise on his accomplishments, and particularly on his Latin poetry, which is compared by all competent judges with the best productions of antient Rome. Dantiscus, son of a burgher of Danzig, rose by his services to the episcopal dignity of Varmia, was employed principally on diplomatic missions, and became such a favourite of Charles V. that he was the only foreign ambassador who accompanied him to Spain after the battle of Pavia, A.D. 1525. He died in 1548, at 83 years of age, and left several Latin poems which were much commended by contemporary scholars, and particularly by Erasmus. Janicki, the son of a peasant (1516-1543), was educated by the liberality of Krzycki, and gained a great reputation when only ten years old. He remained a long time at Padua, and in other parts of Italy, and when he was only twenty years old, Pope Clement VII. crowned him with a laurel wreath. His poems are compared by many Polish and foreign authors with those of Tibullus and Catullus: they were collected and published at Leipzig by Böhm, in 1755, with the following title: 'Janitii Poloni Poetae Laureati Poemata,' &c. The best of them are of an elegiac character. The poems of Casimir Sarbiewski are well known to every lover of Latin literature, and he is universally admitted to be the first modern Latin poet. The other Latin poets of that period are Malinski, Szamotalski, Marszewski, and Kobylinski.

We must not omit mentioning a remarkable person, the particulars of whose life are unknown to us, but it appears that he lived for some time at Venice, and was a great friend of Aldus Manutius. His facility of making verses seems to have been extraordinary. He published a program in which he offered to answer on Candlemas-day, 1584, in the church of St. Paul at Venice, in verse, any question that was addressed to him on divinity or Aristotelian philosophy. He published at Venice, in Latin, a laudatory poem on Zamoyski, surnamed the Great, to which are appended six dithyrambs in the following languages: on Gideon, in Hebrew; Epaminondas, in Greek, Fabius Maximus, in Latin; Gran Capitan Hernando Gonzales de Cordoba, in Spanish; Marco Antonio Colonna, in Italian; and John Tarnowski, in Polish.

The same period produced many eminent prose writers in the Latin as well as in the native language. The most deservedly celebrated of them is Andrew Modrzewski, who was born in 1506. He early embraced the opinions of the Reformers, although he never publicly joined any of the Protestant confessions which were established during his lifetime. In 1534 he went to Wittemberg, where he completed his studies under the direction of Melanchthon, whose friendship he fully possessed. After having resided in several parts of Germany, he returned to his country, and having honorary secretary to Sigismund Augustus, gained the unlimited confidence of that king. His most celebrated work is 'De Republica Emendanda,' which was declared by John Justiniani, a celebrated professor of Padua, Peter Martyr, and many other eminent scholars to be the best political work of that period. It has been translated into German, French, and Spanish; a Polish translation appeared in 1577. The work is divided into 5 books: 1, De Moribus; 2, De Legibus; 3, De Bello; 4, De Ecclesia; 5, De Schola. This last is decidedly of an anti Roman Catholic tendency. It was published at Cracow in 1551, and at Basel in 1554-1559.

---

* Some of his poetry has been translated into English by Dr. Bowring.

Orzechowski (Orichovius), born in 1519, was a Roman Catholic priest, who, having married a wife, maintained an animated dispute with Rome about the lawfulness of the marriage of priests, and became celebrated over all Europe by the eloquent invectives with which he attacked the papal power. He was afterwards reconciled to the church, and became as zealous an advocate of the papal authority as he had formerly been its opponent. Besides his polemical writings, he wrote several works of a political and historical character. His writings in Latin as well as Polish are distinguished by great beauty of style, but disgraced by extreme violence, which was however perhaps well calculated for producing a momentary effect. Being a zealous advocate for a war with the Turks, he supported his views by pamphlets; he wrote also Annals of Poland, but comprising only a short period. The number of pamphlets which he published on several occasions is about 50; the most remarkable is entitled 'Chimaera,' which was directed against the opponents of Rome, in which he attempts to establish the temporal authority of the pope.

Goslicki, bishop of Posnania (1537-1607), is the author of a valuable political treatise entitled 'De Optimo Senatore,' Venice, 1568. It was translated into English by Mr. Oldisworth, and published under the title of the 'Accomplished Senator,' in 1733, London. Adam Burski published, in Latin, at Zamosc, 1604, the philosophy of Cicero, entitled 'Dialectica Ciceronis quae disperse in scriptis reliquit,' &c., a much esteemed work, which is attributed by many to the great general and statesman Zamoyski, who was an intimate friend and patron of Burski. Mscicki was the author of a treatise on logic, besides many theological works. Gorski published, in 1563, 'Commentarii Artis Dialecticae;' and left in manuscript several works on history and politics. The Jesuit Smiglecki published a work on logic, which was long used not only in the schools of Poland, but also abroad; it has been often reprinted, and among other places at Oxford. Petrycy published at Cracow, 1605-1618, a beautiful Polish translation of Aristotle's politics, ethics, &c.

The principal historians of this period are Mathias of Miechow (died in 1523), who wrote 'Descriptio Sarmatiarum Asiaticae et Europaeae,' and 'Chronica Polonorum usque ad annum 1504;' both these works had for some time great celebrity, being the first Polish histories which were printed, and they went through several editions in different countries. In the first work he defended his country against the aspersions of Æneas Sylvius, who wrote against Poland out of spite for the loss of the rich bishopric of Varmia, which was refused to him by the king, although granted by the pope. Martin Kromer (1512-89) was the son of a peasant, but rose by his services, chiefly in the diplomatic line, to the dignity of a bishop. He was the author of a work, 'De Origine et Rebus Gestis Polonorum Libri xxx.,' Basil., 1555, which has been often reprinted; and 2, 'Polonia, sive de Situ, Populis, Moribus, Magistratibus, et Republicâ Regni Poloniae Libri Duo,' Basil., 1568, also often reprinted, and among others by the Elzevirs. It is an admirable geographical and statistical sketch of Poland. Herburt, an accomplished lawyer, wrote a history of Poland in Latin, Basil., 1571; it was reprinted several times, and a French translation of it appeared at Paris in 1573. Neugebauer (died in 1616), a native of Prussia, left two works: 1, 'Historiae Rerum Polonicarum Libri vii.,' Francofurti, 1611; and a continuation of the same work, entitled 'Hist. Rer. Pol. concinnata et ad Sigismundum III. usque Libris x. deducta,' Hanover, 1618. In addition to an historical sketch, these works contain a political and physical description of Poland; they had considerable reputation abroad, although they are in fact nothing better than abridgements of Kromer and some other Polish historians, a fact which the author does not state.

Count Alexander Guagnini was a native of Italy, but having long served in the army of Poland, he was naturalized, and died in that country in 1614. He wrote 'Sarmatiae Europeae Descriptio,' Cracow, 1578, which has often been reprinted in the original text, and in Italian in Ramusio's collection, Venice, 1583. Guagnini was accused by Stryjkowski, who had served under his orders, of having published his manuscript under his name. This accusation, made by a contemporary author, and not contradicted by Guagnini himself, appeared to be so well founded, that Mizler, in his collection of Polish historians, printed this work under the name of Stryjkowski, without even mentioning that of Guagnini; yet the critical acuteness of the learned Lelewel has disproved the imputation of this gross plagiarism against Guagnini, whose work is composed with much more method and order than that of Stryjkowski. This last-named author published in Polish a 'Chronicle of Poland, Lithuania, and Russia,' Königsberg, 1582, and Warsaw, 1766. It is deficient in methodical arrangement, and in historical criticism, and is also disfigured by numerous absurd verses, for the author always describes the most important events in rhyme. Notwithstanding all these defects, it is a valuable work on account of the information which it contains, and which the author collected from traditions, manuscripts, and other sources no longer extant. Stryjkowski himself was a very remarkable character (born 1547). He was educated at the university of Cracow, and continued his studies in several universities of Italy and Germany; for some time he served in the army. Having accompanied a Polish embassy to Constantinople, he made a voyage in the Levant, and was taken by pirates, on which occasion he lost his manuscripts, and remained several years in captivity until his family paid his ransom. On his return to Poland, he took orders, and died in 1600 as archdeacon of Samogitia. The anecdotes and traits of his adventurous life, which he sometimes intermingles in his narrative, give a romantic interest to his work. Lucas Gornicki (1529-59), secretary to king S. Augustus, wrote in Polish a history of his country from 1538 to 1572, which was published in 1637. He is also the author of the following works:—'The Road to a perfect Liberty,' 1590; and a 'Dialogue between a Pole and an Italian, on the Liberty, Laws, and Manners of Poland,' published 1616; 'The Polish Courtier, a free translation of the Libro del Cortegiano of Baltazar Castiglioni, adapted to the Polish court and manners of that time;' a Treatise on Orthography, and several translations of classical authors. His style is a pattern of purity and elegance even in the Augustan age of Polish literature.

Martin Bielski (1500-75) wrote, in Polish, a 'Universal History,' Cracow, 1550, which is characterised by the beauty of its style. He is also the author of a treatise on the art of war, and of several biographies of ancient philosophers. His son, Joachim Bielski, also wrote in Polish a chronicle of his country (Cracow, 1597), which in style is equal to the work of his father. Stanislaus Sarnicki published in 1587, at Cracow, 'Annales Polonorum et Lithuanorum Libri viii.' It contains some absurdities relating to the history of the fabulous times and the origin of nations, but the modern part is judiciously written. He was also the author of 'Descriptio Veteris et Novae Poloniae,' Cracow, 1585. Reynhold Heydenstayn, a learned lawyer, wrote 'De bello Moscovitico quod Stephanus rex Poloniae gessit, commentariorum Libri vi.,' Cracow, 1584, which has often been reprinted. It is a very valuable contribution to the history of Poland, and has all the interest of historical memoirs, as the author was a witness of the events which he describes. His son, John Heydensteyn, castellan of Dantzig, continued the work to the year 1603, from his father's manuscripts, 'Rerum Polonicarum ab excessu Sigismundi Augusti, &c., Libri xii.,' Frankfurt, 1672. Solikowski, archbishop of Leopol (1526-1603), who took an important part in the affairs of his country, was the author of 'Commentarius Brevis Rerum Polonicarum à Morte Sigismundi Augusti,' 1572-1590, Dantzig, 1647, a work not devoid of merit. Paul Piasecki, bishop of Przemysl (1583-1649), wrote a history of Europe, from 1572 till 1645, entitled 'Chronica Rerum Gestarum in Europa,' Cracow, 1645-48, a work distinguished by the soundness of its political views and great impartiality. The author's public career was guided by the principles which he advocated in his work, and his private character was in every respect worthy of praise, yet these very qualities, which give value to his work, brought upon him many bitter enemies, and the Jesuits attacked him violently for having spoken freely of their pernicious influence in Poland, and having called the authors of the Gunpowder Plot in England 'malefactors.' Braun, who wrote a critical work on Polish literature, gives the following judgment: 'This author (Piasecki) told the truth to his countrymen as well as to foreigners; he divulged the intrigues of the papal legate, Annibal of Capua; he discovered the perjury of another legate, Malaspina; he said that the French league had nothing holy but its name; he inveighed against intolerance in Bohemia and Hungary; he raised his eloquent voice in favour of liberty of conscience; he reproached the Jesuits with teaching regicide in the schools of France, and proved the justice of their expulsion from Venice, Bohemia, and England; he brought to light their intrigues at the court of Poland, and maintained that they were the cause of the wars with Sweden, Turkey, Muscovy,' &c. &c.

Among the historians of that period we may mention Bzowski, the continuator of Baronius's 'Ecclesiastical Annals.' He was born of a distinguished family in 1567. Having entered the order of St. Dominic, he was for some time professor of philosophy at Milan, and of divinity at Bologna. On his return to Poland he was made superior of the Dominican convent at Cracow. He went finally to Rome, where he engaged in his 'Ecclesiastical History,' and remained till his death in 1637. The continuation of Baronius, which contains the events from 1198 to 1572, is comprehended in twelve volumes, of which only nine were printed. The work is written with extraordinary research, but it raised much enmity against the author by three circumstances. In the first place, by not having spoken with sufficient respect of John Scotus, surnamed 'Doctor Subtilis,' he offended all the orders which follow the rule of St. Francis; 2dly, having mentioned in a slighting manner a production of St. Hildegarda, he excited the most violent hatred of the Jesuits; and 3dly, the Elector of Bavaria was so angry with him for having written against the emperor Louis IV. of Bavaria, that he ordered his chancellor Hervart to write a refutation of Bzowski, who was ultimately compelled to retract what he had written about the emperor. Bzowski published also a great number of works in Latin, and a few in Polish. Bayle, who gives in his 'Historical Dictionary' a very extensive article on him (under the name of Bzovius), states that it has been remarked of him that it would be no exaggeration to say that Bzowski wrote more works than other persons have read. Lasicki was the author of a history of the Bohemian brethren, and of a 'Treatise on the Samogitian or Lithuanian Mythology.' John Krasinski wrote a description of Poland, entitled 'J. Crassini Polonia,' &c., Bononiæ, 1574: it was written for Henry of Valois (III. of France), when he was elected king of Poland, and contains a political description of that country. It is remarkable for the beauty of its style, and was attributed by Thuanus to the celebrated Sigonius, who was the tutor of Krasinski. This assertion was however proved to be erroneous; Sigonius only induced Krasinski to undertake the work. The celebrated geographer Cluverius (1580-1623), born at Danzig, and partly educated at the court of Poland, belongs also to the authors of that country. We must add to the list of the Polish historians, Paprocki, the author of a genealogical work on the noble families of Poland, published at Cracow, 1578, with many wood-cuts. He also wrote a similar work on Bohemia and Moravia.

Many of the works which have been enumerated were published in the collection of Pistorius, at Basil, 1582, in 3 vols., folio entitled 'Polonicae Historiae Corpus,' &c., and in the Elzevirian collection, 'Rerum Publicarum,' entitled 'Reipublica, sive Status Regni Poloniæ,' &c., Leyden, 1626.

The study of law was not neglected in Poland during this period of its intellectual elevation. A collection of laws was made, containing the code of Casimir the Great (1374), and all the enactments from that time, with the addition of Saxon or Magdeburg law, by which the towns of Poland were governed; this was the work of Raymundus Neapolitanus, and was published, by order of King Alexander I., by the Chancellor John Laski, in 1506, at Cracow. This valuable collection is the only one which obtained a legal sanction. Another collection was published by order of King Sigismund I., at Cracow, 1532; but it never obtained a legal sanction.

James Przyluski was originally a Roman Catholic clergyman, but he embraced Protestantism, and became a public notary of the district of Cracow: he arranged the laws of his country according to the Roman method, 'secundum jus personarum, rerum, et actionum,' Cracow, 1553. This work, although undertaken by order of the king, never obtained a legal sanction, which was mainly owing to the great opposition of the Roman Catholic clergy, on account of the bitter invectives against that body in which Przyluski indulged in his 'Prototypon,' which he had published as a prospectus to his work. John Herburt, castellan of Sanok whom we have mentioned among the historians of his country, published, in 1563, a collection of the laws of Poland in Latin, arranged in alphabetical order. This collection, although never formally sanctioned, was recognised in the courts, and has been reprinted several times. Collections of laws in the national language were published at Cracow in 1560, 1578, and 1581. Stanislaus Sarnicki, already mentioned as an historian, published in Polish a large work, divided into twelve books, on the laws of his country. But the most ample and best collection of the Polish laws, published during this period, is that of Januszowski, Cracow, 1600.

The mathematical sciences and the different branches of natural philosophy were also cultivated with considerable success in Poland during this period. Besides Copernicus, the university of Cracow produced several eminent mathematicians. Martinus of Olkusz (not to be confounded with another mathematician of the same name) received his doctor's degree at Cracow, and became professor of astronomy in the university of that town. This university, being invited by Pope Leo X. to present a project for the reform of the calendar, commissioned Martin of Olkusz to perform this task, which he did in his treatise 'Nova Calendarii Romani Reformatio.' Leo X. signified to the university of Cracow his entire approbation of this work; but the reformation of the calendar was postponed by the important events which agitated Europe, and particularly the church, during Leo's pontificate, and it was not effected till 1583, under Gregory XIII. The change was made however entirely according to the plan proposed by Martin of Olkusz. Although his name was not mentioned on that occasion, an autograph copy of the treatise of Martin of Olkusz has been preserved, and serves as the means of restoring the honour of the reform of the calendar to the real author. He died in 1540.

Stanislaus Grzebski (1526-72) wrote the first work on geometry in Polish, 1566. Peter Slowacki, professor of mathematics in the university of Cracow, assisted in the reformation of the calendar at Rome; and a letter of Pope Gregory XIII., giving great commendation to this mathematician, is still extant; he left almanacs. Broscius, a name Latinized from Brozek (1581-1652), canon of Cracow and rector of the university, was not only deeply versed in the mathematics, but was well acquainted with Greek, Latin, and Hebrew, metaphysics, divinity, medicine, and even music. Besides several works on different subjects, he wrote several mathematical treatises, and a defence of Aristotle and Euclid against Ramus. He was also the author of a severe work against the Jesuits.

Sendzivoy or Sendivogius (1565-1645) acquired a certain reputation over all Europe by his alchemical vagaries. Andreas Mirowski published, in 1596, a 'Theory of Winds.' Willichius, in 1523, a treatise 'De Salinis Cracovianis.' Simon of Lovicz wrote 'De Herbarum Virtutibus,' with figures, 1537; Stephen Falimierz wrote in Polish on different branches of natural history connected with medicine, 1534; Hieronymus Spiczyuski, alderman of Cracow, and physician to King Sigismund Augustus, wrote in Polish a work on animals, plants, and the birth of man, 1534—one part relating to plants, entitled 'Herbarium,' &c., was published with many additions by Siennik, in 1568; the 'Herbarium' of Martin of Urzendow appeared in 1595. But the most remarkable of all the botanical works of that period was that of Simon Sirenski, professor of medicine at Cracow, 'On the Nature and Use of Plants,' Cracow, 1614: it was published at the expense of the Princess Anna Vasa, sister of King Sigismund III., who was a great lover of botany, and left an herbarium, which was collected and arranged with her own hands. The work contains all that was known at that time, and is adorned with many woodcuts. Many authors suppose Zaluzianski, who wrote in the latter part of the sixteenth century his 'Methodus Herbarum,' in which he establishes the sexual differences of plants, a discovery which was neglected till the time of Linnæus, to have been a Pole, but it is more probable that he was a Bohemian.

There were several works on rural economy, the breeding keeping of fishponds, bees, &c.; the best is 'Hippica,' or a work on horses, by Monwid Dorohostayski, grand marshal of Lithuania, an accomplished nobleman. The work was published at Cracow, 1603, with many fine engravings.

Works on medicine were published by Wadzicki, Cyprianus of Lowicz, Peter of Kobylin, and others; but the most distinguished physician of the period was Joseph Strus (1510-1568), who became professor of medicine at Padua, where he acquired a great reputation by reviving the doctrine of Galenus about pulsation, in his treatise 'Artis Sphygmicae, iam mille ducentos annos perditae et desideratae, Libri V, Josephus Posnaniensis,' &c., Venet., 1555, a work which makes an epoch in medicine. He wrote a large number of other works; and his renown was such that he was invited to Constantinople by Sultan Solyman, whom he treated with great success. He died as physician of King Sigismund Augustus.

Military science could not be neglected in a country like Poland, which was constantly involved in war. Albert, duke of Prussia, a vassal of Poland, wrote a great work on the art of war, which he dedicated to King Sigismund Augustus, and sent to him, in German and Polish; the manuscript exists; the work has never been printed. John Tarnowski, grand general of Poland and one of the most eminent soldiers and statesmen whom that country ever produced, published, in his own estate of Tarnow, a treatise entitled 'Consilium Rationis Bellicae,' 1558. A great work on ancient and modern military science in Polish, was published in 1579. Adam Freytag, a native of Thorn, and professor at the Protestant school of Keydany, wrote in German a work on fortification, with many engravings; printed at Leyden by Elzevir, in 1631. It was dedicated to Vladislav prince royal of Poland, and was much esteemed all over Europe.

This is a brief outline of the state of Polish literature during its golden age, which begins with the reign of Sigismund I., 1506, and ends with that of Sigismund III., 1632. We have enumerated the causes of this extraordinary development of the national intellect during that period, which is mainly to be attributed to the prosperous condition of the country, its political importance, the political and religious liberty which did not yet degenerate into licence, and the safety from every kind of oppression enjoyed by its citizens, advantages which attracted to Poland many eminent foreigners, who sought there a refuge from persecutions. The progress of literature and science in Poland was particularly indebted to the exertions of the superior ranks of society, the court, the nobles, and the higher clergy. It is a particular trait which distinguishes this period of Polish civilization, that notwithstanding the bitterness of theological controversy, which divided the country into many parties, there were numerous instances of scientific and literary intercourse carried on with all the marks of friendship and personal esteem, between individuals who were divided by religious tenets, which they warmly defended by their writings. There are indeed instances of eminent noblemen, and even prelates, patronising individuals who professed a different faith. But the reign of Sigismund III. brought a melancholy change in the intellectual condition of Poland. This narrow-minded and bigoted king, during a reign of 45 years, pursued only one object, the extirpation of all the confessions that were opposed to Rome, and the establishment of an undivided papal dominion in Poland. He attained that object by sacrificing every interest of the country; and although the great number of eminent men who were educated during the fortunate reigns of Sigismund Augustus and Stephen Batory counterbalanced for some time the growing evil, the mischievous policy of the king finally prevailed, as those distinguished persons gradually disappeared. Prevented by the laws of Poland, which guaranteed perfect religious liberty to its citizens, from employing open persecution, he, or rather the Jesuits, whose tool he was, advanced this project with great success, by seduction and cunning. Sigismund III. gloried in the nickname of 'the King of the Jesuits,' by whom he was surrounded, and whose patronage was the only road to preferment.

This patronage could only be secured by a display of zeal for the interests of Rome in general, and for those of their order in particular. The king having the distribution of all the chief dignities of the state, and the gift of the starosties, or crown domains, which were granted for life, these dignities were obtained not by services to the country, but by gaining the favour of the Jesuits, whose wealth increased by private donations so rapidly, that in 1627 they had 400,000 dollars (about 100,000*l.* English money) of yearly income. Their colleges spread over all Poland, and at the close of Sigismund's reign they had 50 schools, in which a great part of the children of the nobles were educated. Their riches and the number of their schools went on increasing, for their pupils became the most ardent promoters of their views. The system of education adopted in these schools was calculated not to elevate, but to depress the understanding, and was ably exposed by the learned Broscius, who, although himself a Roman Catholic clergyman and attached to his church, severely attacked (in a book entitled 'Dialogue of a Landowner with the Parish Priest') the retrograde movement which these priests were giving to the national intellect. Unable to avenge themselves on the author, the Jesuits persecuted the printer, who was at their instigation publicly flogged and banished. There were several Protestant schools in Poland, but some of them were destroyed, as well as the churches of the same confession, by a lawless mob excited by the Jesuits, whose protection insured the impunity of these rioters. The Socinian academy of Rakow, which was celebrated all over Europe, and where pupils belonging to different religions were educated, was abolished by a decree of the diet in 1638, in consequence of two pupils of that school being charged with having thrown stones at a cross. This measure, obtained by the growing influence of the Jesuits, was followed by the abolition of the two remaining *Socinian* schools, Kisielin and Beresteczko in Volhynia. The Protestant schools, generally supported by voluntary contribution, were unable to enter into competition with those of their antagonists, which had ample endowments. Many of the former schools, deriving their support from the liberality of great families, ceased to exist, or were converted into Roman Catholic establishments, as soon as their patrons returned to the old faith. The consequences of all this were fatal to the national intellect of Poland; and the literature of that country, which produced so many splendid works in Latin and in Polish, can scarcely boast of any production of merit from that epoch to the second part of the eighteenth century, which was the period during which the Jesuits had unlimited power over the national education. The Polish language, which had attained a high degree of perfection during the preceding period, was soon corrupted by an absurd admixture of Latin and barbaric phrases, called 'macaronic,' which disgraced Polish literary productions for more than a century. As the chief object of the Jesuits was to combat anti-Romanists, the principal subject of their instruction was polemical divinity; and the ablest of their students, instead of acquiring information which might enable them to become useful members of society, lost their time in dialectic subtleties and quibbles. The Jesuits, well aware that vanity is the most accessible of human weaknesses, were as prodigal of praise to their partisans as they were lavish of abuse on their antagonists. Thus the benefactors of their order became the objects of the most fulsome adulation, which nothing but the corrupted taste acquired in their schools could have rendered palatable. Their bombastic panegyrics, lavished on the most insignificant persons, were almost the only literature of the country. The censorship was established in 1617, and the first 'Index Librorum Prohibitorum' was published about that time. Not only the progress of literature was arrested by the influence of the Jesuits, but a great number of valuable productions of the preceding period were destroyed by them, in order to obliterate every vestige of heresy. The families and individuals who passed from Protestantism to Romanism surrendered their libraries to the Jesuits, who delivered them to the flames; they even purchased at a high price all books and documents relating to Protestantism, in order to destroy them. Thus although they were unable to exterminate literary productions belonging to a period of religious liberty with the same violence as they did in Bohemia, they destroyed a great quantity of valuable documents relating particularly to the religious history of Poland.

Notwithstanding this melancholy decline of mental cultivation, Poland produced, in the beginning of this period, some few authors of note. Such were Twardowski (1600-1660), author of several descriptive poems in Polish; Kardzinski, translator of Lucan, and other Latin authors; Birkowski, a celebrated Roman Catholic preacher; Kochowski, a Latin poet, and author of a history of Poland from 1648 to 1673, in Latin; Rudawski, a history of Poland, 1648-

1660. Starovolski, who died in 1656, at a very advanced age, is the author of a great number of historical and biographical works. Wengierski, a Protestant clergyman, is the author of a history of the Slavonian churches; and Lubieniecki, a learned Socinian, is the author of the 'Historia Reformationis Poloniæ.' Siemienowicz, a native of Lithuania, an officer who served a long time in the Dutch armies under the Prince of Nassau, wrote a work on artillery, entitled 'Artis Magnæ Artilleriæ Pars Prima; auctore Cazimiro Siemienowicz, equite Lithuano, olim Reg. Pol. Artilleriæ Propræfecto,' Amstelodam, 1650. Death prevented the author from publishing the second part; but this work, even in its incomplete state, was considered as classical in all Europe, was translated into French and German, and the military authors of the seventeenth century cited Siemienowicz as the most important authority on all that referred to artillery. To this period belongs also the astronomer Hevelius (1611-1687), a native of Danzig, and alderman of that city, where his works were published. He was liberally supported by John Sobieski, in honour of whom he named a constellation Scutum Sobiescianum. The Protestant high school at Leszno or Lissa, supported by the powerful family of Leszczynski, attracted students not only from Poland, but also from Prussia, Silesia, Moravia, Bohemia, and even Hungary. At a time when the university of Cracow and the Jesuits' colleges in Poland, and the Roman Catholic as well as Protestant schools of Germany, followed the old methods of instruction, which were calculated only to waste the precious time of the pupils, the professors of Leszno dared to open a new road in that important field. Comenius, who acquired celebrity over all Europe by his efforts to improve the methods of education, composed for the school of Leszno his celebrated work 'Janua Linguarum reserata,' which greatly facilitated the acquisition of foreign languages. The same school was honoured by the co-operation of another learned individual, Dr. Johnstone, who acquired a great reputation all over Europe by his works, particularly on natural history. He was born in 1603, at Szamotuly or Sambter, in Grand Poland, of a family descended from the Johnstones of Craigbourne in Scotland, and which like many other Scotch families have settled in Poland. After having received a preparatory education in the schools of his native land, he went, in 1622, to England, and continued his studies there and in Scotland till 1625. He returned thence to Lissa, which he left in 1628, and studied medicine in some of the universities of Germany, and in Leyden, London, and Cambridge. Having returned to Poland, he left it after some time again as tutor of two Polish noblemen, with whom he revisited London and Cambridge, where he received the degree of Doctor of Medicine, after which he continued to travel over other parts of Europe till 1636, when he settled at Lissa. He refused the chairs of medicine which were offered to him in 1642 by the universities of Leyden and Frankfort on the Oder; but the wars which agitated Poland from 1653 to 1660 compelled him to leave that country. He retired to Silesia and remained on an estate which he had purchased, till his death in 1675. His principal works are:—'Thaumatographia Naturalis in 10 classes divisa,' &c., Amsterdam, 1632, 34, 61, and 66; 'Historia Universalis, Civilis, et Ecclesiastica, ab orbe condito ad 1633,' Leyden, 1633 and 34, Amsterdam, 1648; Frankfort, 1678, continued till that year; 'De Naturæ Constantia,' &c., Amsterdam, 1632; translated into English and published at London, 1657, under the title 'The History of the Constancy of Nature,' wherein, by comparing the latter ages with the former, it is maintained that the world does not universally decay, &c. 'Systema Dendrologicum,' &c., Lissa, 1648; 'Historia Naturalis de Piscibus et Cetis,' Frankfort, 1646; 'De Quadrupedibus, Piscibus, Avibus, Insectis, et Serpentibus,' 2 vols., Frankfort, 1650; this edition is much praised on account of the plates executed by the celebrated Merian; 'Idea Medicinæ Universæ Practicæ,' &c., Amst., 1652-64; Leyden, 1659. 'Hist. Nat. de Insectis,' Frankfort, 1653; 'Hist. Nat. Animalium, cum figuris,' 1657, 2 vols., translated into English and published at Amsterdam, under the title 'A Description of four-footed Beasts, illustrated by copper-plates,' &c. 'Notitia Regni Vegetalis,' Lipsiæ, 1661; 'Dendrographia, seu Hist. Nat. de Arboribus et Fructibus, Syntagma Medicinæ,' Jena, 1674; 'Idea Hygeinæ,' Jenæ, 1674. 'Notitia Regni Mineralis,' Lips., 1661; 'De Festis Hebræorum et Græcorum,' Breslau, 1660; 'Polyhistor, seu Rerum ab Ortu Universi usque ad nostra Tempora, per Europam, Asiam, Africam, et Americam, in sacris et profanis gestarum, succincta et methodica Enarratio,' Jena, 1660. The number of books which Johnstone published, and that of their editions, prove his great talents and learning, as well as the high esteem in which he was held by his contemporaries.

The wars in which Poland became involved under the reign of John Casimir extinguished the remnant of learning in that country, which was overrun by Swedes, Muscovites, Transylvanians, and the revolted Cossacks; and it was also distracted by domestic factions. Leszno was burnt with its school, in 1656, and many learned establishments, private and public libraries, shared the same fate. From that time Poland continued to be agitated by foreign and domestic wars, till it found a momentary interval of repose under the rule of the heroic John Sobieski, whose brilliant victories threw a halo of glory over the declining fortunes of Poland, although they assured no real or permanent advantage to the country. The first part of the reign of king Augustus II., elector of Saxony (elected in 1696), was agitated by the invasion of Charles XII., who dethroned him, and by his misunderstandings with the nation, which were settled by the diet of 1717. The calamities of every kind which had desolated Poland during nearly 70 years, plunged that country into a stupor, and the profound peace which it enjoyed from 1717 to the demise of Augustus III., 1763, except the transient disturbance which took place at his election, deprived it of all its energy. Poland had still a large territory, and preserved its antient institutions, but it was plunged into a kind of intellectual and political lethargy.

There were some individuals, educated chiefly abroad, who deeply felt the moral degradation of their country, and exerted themselves to awake the slumbering energies of the nation. Stanislaus Lesczinski, having been expelled from the throne of his country for the second time in 1733, became sovereign of Lorraine, where his paternal and enlightened rule proved what a misfortune it was for Poland to have lost such a king. He educated many young Polish nobles at Luneville, and made them into useful and patriotic citizens, who greatly contributed to the restoration of learning in their country. The man to whom Poland owes most in that respect was Stanislaus Konarski, who was born in 1700, of a distinguished family. At the age of seventeen he entered the congregation of the Patres Pii; and in his 25th year went to Rome, where he continued his studies for four years. He afterwards travelled through Italy and France, and remained for some time at Paris. On his return to his country he was struck with the miserable state into which it was plunged; and he perceived that among the numerous causes of mischief there was the want of a regular code of laws, and that the existing collection served only to increase the confusion. Resolving therefore to obviate that defect, he collected with great care all the laws of Poland from the time of Casimir the Great to the year 1739, which he published under the title of 'Volumina Legum,' with a learned preface on the legislation of Poland. Having joined the party of Lesczinski during the interregnum of 1733, he followed him to Lotaryngia; but returned to Poland in 1738, and devoted himself to teaching in the schools of his congregation. Being entrusted with the office of the provincial of his order in Poland during the years 1742-3-4, he reorganised its schools, and introduced a better system of instruction. He established a college at Warsaw under his own direction, wherein he educated, with the assistance of the most enlightened members of his congregation, a great number of youths, who became most useful citizens. In his works he attacked not only the corrupt state of literature and of public eloquence, but even dared to point out the vices of the constitution, and particularly the mischief of the 'Liberum Veto.' This brought on him a great number of enemies, but created at the same time many friends and admirers. His house became a point of union for the most enlightened patriots. Konarski refused the episcopal dignity, which had been offered to him several times, lest he might be disturbed in the pursuit of his useful avocation, which he continued till his death, at the age of seventy-three. This enlightened and patriotic clergyman was also a pattern of Christian piety and charity. The impulse which he gave to his congregation of the Patres Pii continued for a long time, and this congregation ranked among its members many eminent authors. Next to Konarski, the two brothers, Andreas Zaluski, bishop of Kioff, and Stanislaus, bishop of Cracow, did great service to learning in Poland by collecting at their own expense an immense library of 200,000 vols., of which 20,000 were Polish works. The former of them, who possessed extraordinary erudition, particularly in all that related to Poland, was the author of several works. They gave this splendid library to the public in 1747. Many distinguished persons patronised literature, but none so much as the family of the Princes Czartoryski. This powerful family undertook to effect a great and salutary revolution in Poland by transforming the disorderly republic into a well-organised monarchy; and as this could only be done by preparing public opinion for such a change, they sought out and patronised men of superior talents, and such as by their writings exerted or might exert an influence on public opinion. This revival of the national intellect continued to advance, notwithstanding the melancholy circumstances of the country, which lost a great part of its territory by the first dismemberment of 1772. King Stanislaus Poniatowski, although a weak man, and unfit to hold the helm of the state in such troubled times, was an accomplished scholar; and Poland owes him a debt of gratitude for having promoted national education, which is the main cause of that unconquerable spirit of nationality which continues to animate the Poles under the most adverse circumstances. He patronised literary men of merit, admitted them to his intimacy, and invited them regularly one day in the week to his table, where a perfect freedom of speech animated a lively and learned conversation. A board of public education, composed of the most eminent men of the country, was instituted in 1775; and Poland thus set the example of establishing a department for the promotion of the most important object of national welfare. The estates of the order of the Jesuits, which was abolished in 1773, were assigned to the support of schools, which were organised chiefly by the exertions of Count Ignatius Potocki, who formed a complete plan of instruction for the schools preparatory to the universities. By his advice a society for the composition of school-books was instituted, and programs for that object were issued, by which all the authors of Europe were invited to enter into competition for the prizes which were offered. The school-books which were written in consequence of this measure were introduced into the schools. The Institute of Cadets was established under the superintendence of Prince Czartoryski, where the union of a classical and military education produced many distinguished individuals, several of whom, like Kosciusko and Niemcewicz, reflected honour on their country during the eventful times which preceded its destruction. The universities of Cracow and Vilna, which had fallen into a state of decay, were entirely re-organized and rendered highly efficient, the chairs being supplied with able professors, both natives and foreigners. The libraries and cabinets were also increased by the acquisition of books and instruments.

The Polish clergy participated in the intellectual movement which animated Poland, and the church of that country may claim for many of its members the honour of having greatly contributed to the moral and intellectual progress of the nation. Several individuals who had belonged to the order of the Jesuits distinguished themselves by their literary labours.

Adam Naruszewicz, born in 1733, of an antient Lithuanian family, entered the order of the Jesuits in 1748. He continued his studies at their college at Lyon in France; and on his return to Poland, was professor in the schools of the same order till its abolition. He was created, by King Stanislaus Poniatowski, bishop and secretary of state of Lithuania, and died in 1796. His translation of Tacitus (1772), in the conciseness and energy of the style, is equal to the original. His History of Poland, which contains the period from the establishment of the Christian religion to the death of Louis of Hungary (965-1382), first edition 1780-1786, from vol. 2 to 7, is written in a style equal to his translation of Tacitus, with much impartiality and sound criticism; and it is founded on materials collected with immense research. Death prevented Naruszewicz from completing this work; and the first volume, containing his valuable researches on the state of Poland previous to the introduction of Christianity, was published from his manuscripts only in 1824. Naruszewicz occupies an equal rank as a poet by his satires, odes, eclogues, and many successful translations of the classics, particularly of Horace and Anacreon.

Count Ignatius Krasicki, born in 1734, of a distinguished family, and destined for the church from his earliest youth, received a part of his education at Rome, travelled over different parts of Europe, and, having taken orders, was rapidly advanced, and became bishop of Warmia or Ermeland, an exceedingly rich see, with the title of prince attached to it. The diocese being seized by Prussia at the first dismemberment of Poland, he could no longer take any active part in the affairs of his country, but he continued to render it great services by his literary productions. In 1795 he was created archbishop of Gnezno, and died at Berlin in 1801. Krasicki is the most remarkable, and deservedly the most popular author of Poland. His fables, which all the children in Poland know by heart, are generally so short that they resemble epigrams: they are characterised by great wit, charming simplicity, and a pure morality. His satires may vie with the best productions of this kind in any language, and are written in the most beautiful and easy verse: they are free from every personality; they attack national but not individual foibles. He strictly adheres to the following precept, established by himself in one of his satires: 'Satire tells the truth, but insults no person: it honours the government, reverences the king, but judges the man.' These satires, although they scourge vice in all its forms, are written in such a tone that they may be safely read by persons of every age and sex, a praise which unfortunately cannot be bestowed on the satires of Naruszewicz. Myszeis, that is, the 'Mouseide,' or the 'War of Cats and Mice,' an heroic-comic poem, full of wit, animated description, and cutting raillery against the national faults. 'Monachomachia,' or the 'War of Monks,' a burlesque poem in six cantos, contains a witty satire on the ignorance and laziness of the religious orders. Yet although the clergy are severely lashed in this poem, the author is never guilty of throwing ridicule on religion. It is related that when the author came on a visit to Frederick II. at Potsdam, he lodged him at Sans Souci, in the same apartments which had been occupied by Voltaire, saying that he should write there something very clever, and it was in that apartment that the 'Monachomachia' was composed. This poem having irritated many persons, Krasicki wrote his 'Antimonachomachia,' in which he attacked the offended parties with so much wit and good satire, that they became reconciled to him. His epic poem, the 'War of Khotzim,' which describes the memorable events of 1621, cannot claim the name of a real epic poem, but it contains many beautiful images, and some passages which may called sublime. He also made an excellent poetical translation of 'Fingal' and some other parts of Ossian, which rendered these poems exceedingly popular in Poland, and he wrote a great number of fugitive poems. Among his prose works the most remarkable are 'Podstoli,' which exhibits a virtuous landowner, a work designed to correct the defects of the Polish gentry, and which contains a beautiful picture of the national manners and customs; and a novel entitled 'Doswiadczynski' (that is, The Experienced), of a moral and satirical description. He left several comedies, which were published under the name of his secretary, Mowinski. Bohomolec (died in 1790) wrote the first comedies in Polish, the 'Lives of John Zamoyski and George Ossolinski,' &c., and he edited 'A Collection of National Chronicles.' John Albertrandy, a bishop, born of an Italian parent, devoted his long life (1732-1808) to archaeological studies and historical researches relating to Poland, for which purpose he visited several countries, and particularly Sweden. He left some valuable works on national history, of which the greatest part remain still in manuscript. Wyrwicz was the author of several esteemed historical and geographical works. Wengierski (died in 1787), was a witty and agreeable, but sarcastic poet, whose works are unfortunately tainted with the loose morality of the French school of that age. Kniaznin was a successful writer of odes, eclogues, and fables. Trembecki, who died at a very advanced age (1812), has not written much, but his poems, chiefly lyrical and descriptive, are splendid. The best is 'Sophiofka,' or a poetical description of a celebrated park in the Ukraine belonging to the countess Sophia Potocki. Francis Karpinski translated the Psalms, and wrote eclogues and songs, which are characterised by great simplicity and deep feeling, and have become so popular, that they are sung by the common people in all parts of Poland. Having received, in 1771, an estate from the king, situated in the forest of Bialovieja, a wild part of Lithuania, he remained in that rural retreat till his death in 1825, devoted to literature and to the welfare of his tenantry. He wrote also several other works, and among them an 'Autobiography,' published at Wilna, 1834.

Many literary journals appeared during this period, but the best was the 'Monitor,' which was continued from 1764 to 1784, on the same plan as the English 'Spectator,' from which it contains many translations adapted to circumstances and the national manners.

The political dissolution of Poland in 1795 did not arrest the intellectual movement by which the nation was animated. A number of patriotic citizens founded at Warsaw the Philomathic Society, with the object of promoting science and national literature. The university of Wilna, which was included in that part of Poland that was taken by Russia, received a new and superior organization, and an excellent system of public education was established, under the superintendence of the same university, in all the provinces dismembered from Poland. This was done chiefly by the instrumentality of Prince Adam Czartoryski, as a preparatory measure for the restoration of Poland under the sovereignty of the emperor Alexander, an idea which was suggested by Prince Czartoryski, and which seems to have been fondly cherished for some time by Alexander.

The patriotic exertions of Prince Czartoryski were powerfully supported by those of Count Czacki, who by his exertions established the High School of Krzemieniec, in Volhynia, which has promoted education in a very effective manner in the southern provinces of antient Poland that have been incorporated with Russia. The same Count Czacki is the author of a 'History of the Polish and Lithuanian Laws,' and other justly esteemed works.

Niemcewicz, born in 1765, and educated in the School of Cadets, distinguished himself by his eloquent arguments in favour of the introduction of useful reforms, and the abolition of antient abuses, at the diet, which lasted four years (1788-92), and which established a new constitution, by which the 'liberum veto' was abolished, and the hereditary character of the throne established. In 1794 he fought for the independence of his country as an aide-de-camp of Kosciuszko, was made prisoner with him, and kept in the dungeons of St. Petersburg till the emperor Paul released them both on his accession to the throne. He accompanied Kosciuszko to England and the United States, where he married and remained several years. He returned to his country only after the creation of the duchy of Warsaw in 1807, in order to devote his service to the re-awakened hopes of the national restoration. He filled several important offices, and after the establishment of the kingdom of Poland by the congress of Vienna, he was made secretary of the senate. During the national insurrection of 1830-31, he was created a senator by a decree of the national representation, and died in 1841, as a refugee at Paris, occupied, till his last moments, with literary pursuits tending to patriotic subjects. The numerous works published by this eminent individual are not only written with great talent, but have always a patriotic object. His principal productions are 'Historical Songs of Poland, with Music and Engravings,' a work composed with the view of rendering popular the most important events of the national history, and which has been attended with the greatest success; 'The History of the Times of Sigismund III.,' 3 vols., with engravings; 'A Collection of Memoirs relating to the Ancient History of Poland;' 'Levi and Sara, a Novel in Letters, or a Picture of the Condition of the Polish Jews,' which has been translated into English; 'John of Tenczyn,' an historical novel; 'Fables and Tales in Verse,' distinguished by their beauty, wit, and agreeable versification. He has also translated many poems from foreign languages, amongst others, that of the 'Rape of the Lock,' by Pope. John Sniadecki is equally distinguished by his works on astronomy and on literature; and his brother Andrew, by his works on different branches of natural philosophy. Woronicz (died in 1829, as archbishop of Warsaw) was an eminent poet and a first-rate preacher; but the authors who have exercised the greatest influence on their countrymen, and who enjoy the highest reputation among the Polish writers, are Lelevel and Mickiewicz.

Joachim Lelewel, born at Warsaw in 1786, was educated in his native town. He completed his studies at the university of Wilna in 1809. He became professor of history, at Krzemienietz in Volhynia in 1814, and public lecturer on the same subject at Wilna. In 1816 he was called to the newly created university of Warsaw as professor and librarian, and in 1821 he obtained the chair of history at Wilna. His popularity continued unabated till 1824, when the Russian government, taking the alarm, deprived Lelevel of his chair. He retired to his native town, and continued to devote himself to his literary pursuits; but he was elected nuncio to the diet of 1829, and the revolution of 1830 called him to great activity. He was elected member of the supreme executive government, and retired, after the fall of the Polish cause, to Paris, which he was obliged to leave in 1832, at the instigation of the Russian ambassador; he remained for some time in the country-seat of his friend General Lafayette, but was finally obliged to retire to Belgium. The number of his works, which are full of the deepest historical research, is startling. The principal are a 'History of the Nations which inhabited central Europe previously to the tenth century;' 'Researches on the Geography of the Antients;' 'The History of Antient India and of its Influence on the Nations of the West;' 'The Discoveries of the Carthaginians and Greeks in the Atlantic;' besides many other works relating to the history, bibliography, legislation, and diplomacy of Poland. During his exile, he published at Brussels 'Numismatique de l'Europe en Moyen Age;' 'Histoire Numismatique de la Gaule,' &c. Many of his works are translated into German.

Adam Mickiewicz was born at Nowogrodek, in Lithuania, in 1798, of an antient family. He entered the university of Wilna in 1815, and was appointed a few years afterwards teacher in the school of Kowno. His poetical talent developed itself at an early age, but although he became in the course of his studies thoroughly acquainted not only with the beauties of classical poets, but also with those of the modern nations of Europe, his muse chose the hitherto untrodden path of the popular poetry. Mickiewicz perceived the beauties which were contained in the songs, traditions and tales of the people of Lithuania, and he created from those materials a really national poetry. His ballads and other poems of a similar description, published in 1822, obtained at once a great and deserved popularity throughout all parts of Poland. In 1823, when the Russian government began to oppress the university of Wilna, Mickiewicz, being accused of belonging to a secret patriotic society, was kept for some time in prison, and afterwards sent, with many other young men, into the interior of Russia. His talents, agreeable manners, and high moral qualities inspired the Russians among whom he was placed with the greatest respect, and his exile proved to him a source of triumph, for he was treated with the greatest distinction, and Russians learned Polish in order to read the productions of Mickiewicz, which were translated into their language, and were no less admired by them than by the Poles. Prince Gallitzin, general governor of Moscow, attached him to his person, paid him the greatest attention, and took him to St. Petersburg, where he met with the most flattering reception in the drawing-rooms of that capital. Yet neither the favour of the Russian public, nor the most flattering distinction of the powerful, which insured for him a rapid preferment and a situation of comfort and ease, could shake for a moment the patriotic feeling of Mickiewicz, which breathes in all his productions written and published during his residence in Russia. The principal of these productions are, 'Dziady,' that is, 'Ancestors,' founded on the festival of that name, which has been retained from the pagan times to the present day in Lithuania, and the object of which is to propitiate the souls of departed ancestors with meat and drink. This wild and original poem contains many beauties of the first order. 'Grazyna, a tale;' 'Ode to the Youths,' and 'Faris, or the Arabian Horseman,' both splendid compositions; a beautiful English translation of the last appeared in the 'Metropolitan Magazine,' November, 1831. 'The Polish Mother,' is a heart-rending elegy; Conrad Wallenrod,' a tale in verse, from the history of Lithuania, displays great poetical beauties, and is full of patriotic allusions to the present times. It has been translated into several languages, and a fine metrical translation in English by Mr. Catley appeared in 1841, besides one in prose at Edinburgh in the same year by Jablonski. The 'Books of the Polish Pilgrimage,' of which an English translation appeared in 1833, is a pure imitation of the Biblical language, and contains a poetical image of the past of Poland, and a prediction of its futurity. The Abbé de Lammenais took from it the idea of his 'Paroles d'un Croyant.' Both these productions, although full of a deep religious feeling, were condemned by the pope as having a democratic tendency. 'Pan, or Mr. Thaddeus,' a tale in verse, contains an exceedingly clever picture of country-life in Lithuania, and has a great value on account of its truly national character. Mickiewicz, who has been for some time professor of Latin literature at the university of Lausanne in Switzerland, was lately appointed professor of the Slavonic languages and literature at Paris.

Casimir Brodzinski (1791-1835) served in all the French wars from 1809 to 1813, as an officer of Polish artillery, and was afterwards professor of literature at the university of Warsaw. He perceived, even before Mickiewicz, that the songs of the Polish people presented rich materials for a truly national poetry, and in 1811 he published his 'Village Songs.' When Mickiewicz's poems appeared, they created a great sensation, and found not only warm admirers, but also violent antagonists, chiefly amongst the adherents of the French school, who, calling themselves classical, condemned the opposite, or Romantic school; Brodzinski warmly espoused the latter, and contributed greatly to its success by his writings, being one of the best critics in Poland. He left a great number of works on different branches of literature which have not yet been collected: several of his poems have been translated into English by Dr. Bowring. Louis Osinski, who was for a long time director of the theatre at Warsaw, translated several tragedies of Corneille and Racine. Felinski wrote a tragedy called 'Barbara Radziwill,' which, with that of 'Ludgarda,' by Kropinski, are considered the best in the Polish language. The greatest services to the national theatre were however rendered by Boguslawski, who began his dramatic career in 1778, and continued it almost to his death, in 1829. He left about eighty plays, original and translations, and was himself an excellent performer. To the principal authors of this period we may add Kozmian, Madame Hofman, Wenzyk, Morawski, and Odyniec, who made a beautiful translation of Byron's 'Corsair,' and many equally successful ones from Scott, Moore, Southey, &c. Great service was rendered to the Polish language by the Lexicon of Samuel Linde, 6 vols. 4to., Warsaw, 1807-14. It contains not only all the Polish words, with their etymology and quotations from the writers who have employed them, after the manner of Johnson's 'Dictionary,' but also their translation into all the written Slavonian dialects, as well as Latin and German: it is perhaps the most extensive and complete work of its kind.

The unsuccessful insurrection of 1831 was followed by the most melancholy consequences to the national language and literature of Poland. The university of Warsaw was abolished, and its library and collections, as well as those of the Philomathic Society, were transferred to St. Petersburg. The splendid library of Prince Czartoryski at Pulawy shared the same fate. The university of Wilna was also abolished, and the library and museum transferred to Kieff, where a new university was founded. The same was done with many schools. The Russian language was substituted for the Polish in the schools of the antient provinces of Poland incorporated with Russia, where the Polish language was also abolished in judicial proceedings, in which it had been hitherto preserved. Yet notwithstanding these unfavourable circumstances, many Polish works, some of which are of considerable merit, continue to be published. The refugees in Paris have published a great number of books and pamphlets, the most remarkable of which is the 'History of the Insurrection of Poland in 1831,' Paris, 1834, 2 vols., by Mauritius Mochnacki, a young man of eminent talent. Death prevented him from completing this work, which belongs to the most valuable modern historical productions. He had published in Poland a work on the literature of that country in the eighteenth century. Wrotnowski, Pietkiewicz, and Jelowicki have also furnished valuable contributions to the history of the same insurrection. Czaykowski wrote some historical romances not devoid of merit, particularly those which relate to the Ukraine. This country, which literally signifies 'borders,' being on the boundaries of Poland, Russia, and Turkey, was for a long time the scene of many daring adventures, and the abode of a bold and enterprising but lawless race. It furnishes therefore a fine field for romance and poetry; this latter was cultivated with great success by Goszczynski, Malczewski, and Zaleski, whose poems are founded on local traditions, songs, and tales. Padura composed ballads in the dialect of the Ukraine, which frequently unite the wildness of the original poetry of that country with beauties of a higher order. The national songs and traditions of all parts of Poland have been recently collected and published at Warsaw, Wilna, and Leopol, 1833-1840.

Count Alexander Fredro published, in 1839, five volumes of comedies, which are considered the best in the Polish language, and have been performed with great success. His brother, Count Maximilian, produced, in 1837, at Leipzig, several tragedies. Many plays of Shakspere, translated by Holowinski, were lately published at Wilna. Two dramatic poems, although written in prose, and not calculated for the stage, produced a considerable sensation by the boldness of their conception and ideas, as well as the many beautiful images which they contain, and the profound grief of a wounded mind, which revolts against the existing order of things, and of which his country is a victim. One of them, 'Nieboska Komedia,' the 'Not Divine Comedy,' represents a deadly struggle between the old and new ideas which are now agitating the world. The other entitled 'Irydion' represents a young Greek born of a Scandinavian woman, who is with his sister at Rome in its most corrupted time under Heliogabalus, and who devotes all his energies in order to avenge the wrongs of his own and other conquered nations by destroying Rome through a conspiracy of gladiators and barbarians. These productions were published anonymously, but their author is known to be Count Sigismund Krasinski, a young man of great talent, who has written some historical novels. Witwicki, Gorecki, and Slowacki have recently published at Paris many successful minor poems.

Historical researches are not neglected by Polish writers. The history of Slavonian legislation, by Macieyowski, and his Memoirs on the history, literature, and legislation of the Slavonians, produced a great sensation not only among all the Slavonian nations, but among the learned Germans, into whose language they were translated. Kuchavski's work on the most antient monuments of Slavonian legislation, in 1838, was no less successful. Count Edouard Raczynski published a description of Polish and French medals with engravings. He also published at his own expense several inedited memoirs and other historical documents. The same Count Raczynski established at his own expense a public library at Posen, and supported its librarian Mr. Lukaszewicz, in his researches into the religious history of Poland, the result of which was several valuable contributions to the history of the Reformation in that country. Narbutt published in 1837, at Wilna, a detailed history of Lithuania, and many other historical contributions have recently appeared, and several literary periodicals continue to appear in different parts of Poland. We may conclude this article by observing that it is a striking proof that the love of national literature continues unabated in Poland notwithstanding its unfortunate political condition, that many works in the Polish language are frequently published and reprinted at Leipzig, and are excellent speculations.

The sources for the study of the history of the Polish language and literature are—Bentkowski's *History of Polish Literature*, Warsaw, 1814; Ossolinski's *Critical Notices on the History of Polish Literature*, 4 vols.; Juszynski's *Dictionary of the Polish Poets*; Chodyniecki's *Dictionary of Learned Poles*; Wiszniewski's *History of Polish Literature*, of which the first volume appeared in 1840.

Bohemian Literature.—The national literature of Bohemia is older than that of any other Slavonian country, and its monuments extend as far back as the tenth century. The most valuable remnants of antient Bohemian literature were however only recently discovered; they consist chiefly of the so-called *Kralodvorski* (queen's court manuscript), discovered by Professor Hanka in 1817, which contains the fragments of a collection of epic and lyric poems, composed apparently in the thirteenth century. This collection must have been considerable, as the fragments contain only the twenty-sixth and the twenty-eighth chapters of the third book: the loss of the remainder is much to be lamented, as the fourteen songs which have been preserved surpass all similar productions of the middle ages in their poetical beauties, deep and tender feeling, and purity of language; the form in which they are composed is peculiar, and truly national. Besides this collection of poems, there are extant about twenty poetical and more than fifty prose compositions, belonging to the earliest period of Bohemian literature, that is, before the time of John Huss. Dalimil's 'Rhymed Chronicle of Bohemia' was written in 1314; the 'Book of Instruction to his Children,' by the knight Thomas of Sztitny, in 1376; the fabulous poem entitled 'The Council of Animals,' by an unknown author of the same period, is still in general repute; a work on the judicial organization of Bohemia, by the Baron Andreas of Duba, chief-justice of the country, was written in 1402; and a politico-didactic poem by the Baron Smil Flaszka of Richebourg, chief-secretary of state in 1403. To the beginning of the fourteenth century there belong several historical songs, as, for instance, on the battle of Cressy, where king John of Bohemia was killed. Many foreign works were also translated into Bohemian during that period, as, for instance, the 'Alexandreide;' 'King Arthur's Round Table;' the story of 'Tristram;' the 'Travels of Marco Polo,' &c. The emperor Charles IV. king of Bohemia founded the university of Prague, and was a zealous promoter of the national language, of which he was so fond, that he recommended in his golden bull that the electors of the empire should acquire a knowledge of it.

John Huss commenced a new period of literature for Bohemia, as Luther did afterwards for Germany. He introduced that simple and precise orthography of the Bohemian language which is still used, and it is to be regretted that the treatise which he wrote on that subject has not been printed. Huss wrote several pieces in Bohemian hexameters; he revised and corrected the old Bohemian version of the Bible, and left in his native tongue about twenty compositions. The followers of Huss produced an extraordinary number of religious works, and there are still extant many tracts of a polemical, dogmatical, and ascetical nature, written by the several sects of Hussites during the fifteenth century. Many of these tracts, by no means devoid of merit, were composed by common mechanics, peasants, and women. Several of the Hussite religious compositions, which were much valued in the time, are however lost, having been chiefly destroyed by the enemies of that sect. Some of the religious hymns of the Hussites contain high poetical beauties, but in general the national poetry of that period degenerates into a mere rhyming; although the imperfectly preserved poems of Prince Hynek, son of king George Podiebrad (who reigned from 1458 to 1471), are not devoid of merit. But although the poetical literature of Bohemia declined during the fifteenth century, the prose style was developed, as the national language was exclusively used in all public transactions in Bohemia, instead of the Latin. The state papers of Bohemia, and the letters of the Bohemian statesmen during that period, are considered patterns of concise, clear, and energetic language, but unfortunately the Bohemian chancery, towards the end of the fifteenth century, abandoned this fine style, and began gradually to imitate the diffuse pomposity of the Germans. The national language, the study of which was promoted by the University of Prague and the example of the court, acquired a high degree of perfection, and a great superiority over all the Slavonian dialects, which were at that time in an uncultivated state, and without almost any national literature. Owing to this circumstance, its use began to spread over other Slavonian countries, but particularly Poland, the idiom of which country is very similar to that of Bohemia. The Poles also resorted in great numbers to the university of Prague, where they had a separate college.

Besides these religious compositions, the national literature of Bohemia contains other important works belonging to this period. Ziska, the celebrated leader of the Hussites, was also an author. He composed a war-song to animate his soldiers, and military institutions for their use. A work of the same kind, which contains more particulars about the military science of that time, was written by his contemporary the knight Hajek of Hodetin. Venceslav Wilczek of Czenow, an experienced commander, wrote, in the second part of the fifteenth century, a strategic work, which has been recently discovered, and which throws great light on the tactics of the Hussites; but it contains numerous technical expressions, now entirely obsolete, which often render the work unintelligible. The national history was however not cultivated in a manner as it would have been desirable on account of the great events which took place in Bohemia during that period. A collection of the histories of that time was published by Palacky, in his 'Scriptores Rerum Bohem.,' Prague, 1829. A great deal of very interesting information on the geography of several countries, as well as the manners and customs of that period, is contained in the following travels:—Baron Albrecht Kostka of Postupic, to France, 1464; Baron Leon of Rosmittal, over Europe, 1469; the Bohemian brother (a member of a sect of the Hussites) Martin Kabatnik, to the East and Egypt, 1491; and of Baron John Lobkowitz, to Palestine, 1493. Among the political works of that period the most remarkable are those of the governor of Moravia, Baron Ctibor, of Cimburg and Tobitchow (died in 1494), which are characterised by great talent and powerful eloquence; and that of the knight Victorin Cornelius of Visehrad, the eloquence and precision of whose style almost equals the best writers of antiquity. The 'Art of Governing,' by Paul Zidek, canon of Prague, dedicated to King George Podiebrod, is a composition of superior merit, as well as his great encyclopædical work. There are also many works on various branches of economy, and other similar subjects, belonging to this period.

The period from 1520 to 1620 is called by the Bohemians the golden age of their literature, and indeed science, literature, and art were cultivated in Bohemia during that period with much success. Public instruction in Bohemia was in a more flourishing state than in other countries. Prague alone contained, besides three universities, sixteen educational institutes, among which there were several for girls; and parochial as well as higher schools were established over all the country. The Bohemian language attained its perfection, and the number of works of every description published in that language increased very greatly. But notwithstanding this universal diffusion of information, and the great number of native works produced at that period, few of them are of superior merit. Not a single native has distinguished himself in science, although Kepler and Tycho Brahe had for some time the care of the observatory of Prague.

No truly great poetical genius appeared in Bohemia during this period. George Streyc translated the Psalms, and Symon Lemnicki, of Budecz, was the poet-laureate of the emperor Rudolph II. Oratory however acquired during the same period an eminent degree of perfection, and the few productions of that description which have reached us make us regret the loss of the remainder. The 'Memoirs' of Baron Charles of Zerotin, governor of Moravia (1574-1614), and his 'Bohemian Letters,' are still patterns of a finished epistolary style. The next celebrated historian of that period is Venceslav Hajek, of Luboczan (died in 1553), but his 'Chronicle of Bohemia' is rather an historical romance than a trustworthy history. Considerable merit is displayed by the following historians, whose works still remain in manuscript:—Bartosz of Prague, public notary (died in 1544), who depicted in glowing colours the religious disturbances of Bohemia in 1524; and Sixtus of Ottersdorf, chancellor of the old city of Prague (died in 1583), who gives a very circumstantial account of the events that brought about the celebrated bloody diet of 1547. John Blahoslav (died in 1521), the author of a history of the Bohemian brethren; the anonymous author of a Universal History, of which only the first volume, preserved at Stockholm in Sweden in MS., is extant; and finally Vaclav of Brzezan, an excellent genealogist and biographer, whose works are distinguished by clearness of exposition, brevity of style, and deep research. Among the historians of that period whose works were printed were, Daniel Adam of Veleslavin, an industrious and patriotic writer; and the Pole Paprocki, who wrote an account of the noble families of Bohemia and Moravia. Valuable materials are furnished by the travels and adventures in the East of the knight Ulrich, prefect of Wlkanowa, 1546; as well as by the travels of Mitrovic, 1599; and those of Christopher Harant of Palzic, 1608. The other remarkable authors of that period are, Nicholas Konac of Hodislav (died in 1546) one of the superior judges of the country; the bishop of the Bohemian brethren, John Augustus (died in 1572), the cathedral canon of Prague; Thomas Bavorowski, an eloquent preacher (died about 1560); the senator of Prague, Paul Koldin (died in 1589); the linguist Mathias Benesowsky (died in 1587); the eminent classical scholar Abraham of Ginterod; the justice baron of Budova (died in 1621); and the two distinguished religious writers, Martinus Philadelphus Zamrsky (died in 1592), and Gallus Zalansky (died in 1620). Perhaps the most remarkable production of that period is the Bible of Kralic. Baron John Zerotin assembled in his castle of Kralic, situated in Moravia, eight of the most learned men of the Bohemian brethren, who, in the course of fifteen years, made a new version of the Scriptures from the original tongues, with a commentary: the work was published in six 4to. volumes, 1579-1594. No nation at that time could boast of a similar work. The Bible of Kralic was always considered a pattern of a pure, elegant, and correct style: its merits were even admitted by enlightened Jesuits, and it is studied now by all those who wish to write the Bohemian language with purity and correctness.

A melancholy period for the language and literature of Bohemia began with the Thirty Years' War, and particularly from the battle of Weisenberg, when the Palatine of the Rhine, who was elected king of Bohemia by the Protestant party, was defeated by the Imperialists; and the rapidity with which Bohemia fell from a high degree of civilization into an almost barbarous state is unexampled in history. The most distinguished individuals of the nation perished either on the scaffold, or on the field of battle, or from pestilence. Others who were distinguished for talent and superior education left the country; first the clergy and the teachers, then the burghers, and finally the nobles. The places of those exiles could not be easily supplied, and the want of able men was particularly felt in the schools, which were provided with teachers who either distinguished themselves by their zeal for the dominant party, or were employed only for want of better. Crowds of Spanish, Italian, Belgian, and Irish adventurers flocked to Bohemia, and became principal landowners, occupying public places, and giving the tone to society. The Bohemian nationality was morally destroyed. A native Bohemian was, according to the new order of things, synonymous with rebel and heretic. Many natives, in order to avoid suspicion, renounced their nation, Germanised their Bohemian names, and feigned a foreign origin. The emissaries of the Jesuits, who ruled the country, accompanied by soldiers, visited every house in order to take away and to destroy all books suspected of heresy. As it was an admitted principle that all books written from 1414 to 1625 might be heterodoxical, it was no wonder that the emissaries, who did not make a scrupulous examination amongst so great a number, and chiefly their companions the soldiers, committed all Bohemian works to the flames. Some enlightened Jesuits, as Balbinus, protested in vain against this barbarous persecution, which was continued till about the middle of the eighteenth century. The Jesuit Anthony Kenios, who died in 1760, boasted of having burnt about sixty thousand books. It is indeed astonishing that, notwithstanding this destruction, there are any monuments of old Bohemian literature extant. A mental darkness spread over the country was a natural consequence of those proceedings. There were still however some able writers, who had received their education previously to the beginning of the Thirty Years' War. Count Slavata, who died in 1658, wrote in Bohemian a history of his own time, in fifteen volumes in folio: this work has not been printed. The exile Paul Skal of Zbor wrote from 1620 to 1642, first at Lübeck, then at Freyberg in Saxony, a Universal Ecclesiastical History, in ten large folios, filled with a small hand-writing. This work also is still in manuscript; it contains much important information about the ecclesiastical affairs of Bohemia up to the year 1624. Amos Comenius, the last bishop of the Bohemian brethren in his country, was also the last ornament of the national literature.

The emperor Joseph II., by the decrees of 1774 and 1784, ordered the introduction of the German language into all the schools of Bohemia, and the inhabitants were no longer permitted to learn in their national language anything except reading, writing, the catechism, and the elements of arithmetic. This was a severe blow to the Bohemian language and literature, and the more dangerous as the decrees promoted real information, though they established the superiority of German over Bohemian civilization by introducing the exclusive use of the German language in all matters of administration. Yet this measure appears to have awakened the slumbering energies of the nation, and to have stimulated it to new exertions. The first man who raised his voice in behalf of the nationality of his country was General Count Francis Kinsky, who rendered great services to the military organization of Austria, and to the civilization in Bohemia. He advocated the cause of Bohemian nationality in a work written in German in 1774; 'Recollections on an important subject.' His example was followed in 1775 by Pelzel, the author of an excellent history of his country in the national language. In 1779 the government found it necessary to recommend instruction in the Bohemian language in the superior military schools. The awakened intellect of the nation, promoted by the improved system of public education, began to exercise a salutary influence on the study of the national language and on its literature; new original compositions were written; foreign works of merit were translated; and many valuable monuments of the antient literature were brought to light. The following individuals also distinguished themselves in the noble work of regenerating their national literature: Franz Faustus Prochazka, a Pauline monk, 1792-1804; Waclaw Kramerus (died in 1808), who published many excellent popular works; Albert Vincent Parizek (died in 1823), who composed and translated many valuable works for schools and the use of children; and particularly Joseph Dobrowsky, who is justly considered the patriarch of Slavonian literature in modern times, not only by his own countrymen, but by the scholars of all other nations of that race. He was born of Bohemian parents at Gyomar in Hungary, in 1753, and entered the church in 1772, after having received an excellent classical education. He continued his theological study at Prague, and became about 1776 rector of the seminary of Olmütz. He soon however left that place, and became tutor in the family of Count Nostitz. He settled after that time at Prague, and the study of Slavonian became his passion and the object of his life. He was noticed by the first families of the country, who wished to attract him to their circle; but Dobrowsky, fond of independence, was rarely induced to receive any assistance. His habits were of the utmost simplicity, and he travelled a great deal about the country on foot, visiting the most remote corners, in order to observe any antient ruin or monument, or place remarkable for any historical event; and to collect at the same time the remains of national language and history, preserved in the local songs and traditions. Having acquired a considerable reputation in his country, supported by some powerful friends, he made a journey to Sweden in 1792, in order to examine the manuscripts which were carried from Bohemia by the Swedes during the Thirty Years' War. He returned from that country by St. Petersburg and Moscow, where he examined the collections of Slavonian manuscripts. In 1796 he published an account of his literary researches made during these travels. In order to restore his health he went to reside in a country-house of his former pupil Nostitz, and during that time studied botany with so much success, that he was able to write a very clever botanical dissertation. Universally beloved on account of his great learning and the simplicity and honesty of his character, he spent his life among his friends, constantly engaged in the pursuit of his favourite studies, and he kept up a learned correspondence with several of the most eminent scholars of his time. He died at Vienna in 1827, in the 78th year of his age. He left a great number of works, chiefly on Slavonian subjects, the most important of which are, a 'History of the Bohemian Language and Literature,' last edition, Prague, 1818; 'Slavina, a message from Bohemia to all the Slavonian nations,' containing a collection of treatises on Slavonian subjects; on Cyrillus and Methodius, the apostles of the Slavonian nation, &c.: the number of his works on different subjects is about forty.

Francis Tomsa (died in 1814) was the author of some excellent grammars, and several valuable works for popular instruction. There were also Waclaw Stach, John Rulik, the brothers Tham, and several others. This literary movement was shared by the Slovaks of Hungary, who use the Bohemian language; and the principal writers among them who may claim merit for their services to the national language and literature are Leski, Rybay, Tablic, Palkowic, and Roznay.

The labours of the authors who have been enumerated, were chiefly directed to promote education and the national language, and were confined to prose. But the learned clergyman Anthony Puchmayer attempted (1795), with considerable success, to revive the poetry of Bohemia, and he also made his countrymen acquainted with the cognate literatures of Poland and Russia. The example was followed by others, and amongst them chiefly by the brothers Albert and John Negedly, Joseph Rautin, Kranz, Francis Stepniscka, Sebast Hnewkowsky, Francis Swoboda, &c., but particularly Joseph Jungman, professor in the university of Prague. The persevering efforts of these patriotic writers were however, for a long time, unproductive of any important result, as the nobility and the greater part of the more educated classes had become complete strangers to the language of their forefathers. They had therefore to contend with great difficulties; and it is owing only to their unwearied exertions, assisted by some fortunate circumstances, that the national literature of Bohemia begins finally to assume a steady progress in its own country. The year 1818 may be considered as opening a new æra for Bohemian literature, by the publication of the antient national poems, contained in the 'Kraledworsky' manuscript, which has been already mentioned, and which produced a powerful effect on the literature of Bohemia. The establishment of a national museum at Prague, by Count Kolvrat in 1829, has exercised a most salutary influence on the progress of the national intellect. Several decrees of the government, published in 1816-1818, recommended the study of the Bohemian language in the gymnasia of the country; but these dêcrees were annulled in 1821. Since that time, the language and literature of Bohemia have been advancing with great rapidity. A scientific terminology for all the branches of human knowledge, and which the western languages of Europe have chiefly derived from the Greek, was created from pure Slavonic roots; and the merit of this difficult task belongs to the professors of the university of Prague, Joseph Jungman and John Presl. The poetical diction was much improved by the study of the Kraledworsky manuscript, and the successful imitation of its metre, an improvement which is mainly due to the efforts of the historian Palaly, Schaffarik, and Hanka, the most eminent Slavonian scholars of their time. Many alterations in the Bohemian orthography were introduced according to a plan recommended by Dobrowsky. This innovation was however strongly opposed by several zealous partisans of the antient orthography, and particularly by the professors of the Bohemian language, Negedly at Prague, and Palkowic at Presburg. This difference, although relating to a subject of minor importance, created a violent dispute. The advocates of the new orthography were accused by their opponents of promoting innovations dangerous to religion and morality; and the study of the other Slavonian dialects was considered by some as implying a political tendency to the interest of Russia. Fortunately these absurd accusations vanished before the good sense of the public and of the government, and the Bohemian literature has continued to advance in its development, and to increase in popularity among all classes.

The following is a brief notice of recent Bohemian authors:—Francis Vladislaw Celakowsky, born in 1799, possesses a vigorous and highly cultivated talent, original and thoroughly national. His principal works are:—'Various Poems,' Prague, 2nd edition, 1830; 'Echo of Russian Songs,' ibid., 1829; 'Echo of Bohemian Songs,' ibid., 1830. His productions are considered equal in merit to the best poetical compositions of modern times. Vaclaw Klicpera, born in 1792, has composed more than thirty dramatic works, of which several have obtained great success.

John Kollar, born in 1793, of a Slavonian family in Transylvania, received his preparatory education in his native land. In 1817 he went to study divinity at the university of Jena, where he became passionately attached to the daughter of a clergyman. This love inspired his muse, and in his 'Slavy Dczera' (the daughter of glory), (Ofen, 1824), he expressed his feelings for his beloved Mina, whom circumstances permitted him to marry only in 1835. This production, which established his reputation as the first poet in the Bohemian language, comprises 150 sonnets, of which many contain the description of his love, whilst in others he deplores the fall of several Slavonian nations which had once occupied the shores of the Baltic and the banks of the Elbe. Many of these sonnets may be compared with those of Petrarca, and it is admitted that he has created a new poetical language for the Bohemians. In 1832 these sonnets were republished, with the addition of new ones, which describe the Slavonian heaven and the deeds of the Slavonian heroes received into it, while others depict the Slavonian hell, the abode of the unworthy Slavonians and of the enemies of their race. A great knowledge of the Slavonian history is displayed in these compositions, but this very circumstance renders them on the whole cold and prosaic, notwithstanding many beautiful passages. He has also published a collection of minor poems and songs. In 1819 he became clergyman to a newly created Slavonian Protestant congregation at Pesth, and the great difficulties with which he had to struggle in the discharge of his duty are said to have changed the animated poet into a serious and even morose person. The collection of sermons which he had preached before his congregation, and which he published in 1831, display profound piety and an extraordinary knowledge of the human heart, as well as great beauty of language. He has paid much attention to the schools of his parish, and composed some books for their use. Kollar occupies also a distinguished place among Slavonian philologers and historians. He is the author of 'Dobre wlasnosti narodu Slovanskeho,' *i.e.* 'the good qualities of the Slavonian nation,' Pesth, 1821, and of Researches on the names and antiquities of the Slavonian nation and its branches. He has rendered great service to Slavonian literature by his collection of the national songs of the Slovaks of the Carpathian mountains. Kollar is one of those who have perceived the necessity of an understanding among all Slavonian scholars, in order to promote by their united efforts the progress of their literature, and he made an appeal to them for that object in his work, in 1828, 'O wzajimnosti Slowanu,' on the reciprocity of the Slavonians. Kollar's merits as a Slavonian scholar are universally acknowledged, and he is continuing his labours with the greatest success.

J. Lauger, born in 1806, is an original writer, but has not had sufficient cultivation. He has written clever national eclogues and tales, and several satirical poems. Charles Machacek, born in 1799, is the author of the best Bohemian comedy, entitled the 'Wooer;' the national opera owes likewise to him the great improvement which it has received since 1822. Charles Schueller, a pòpular author, wrote the best Bohemian ballads, published in 2 vols., 1823-30. J. N. Stzepanck, born in 1783, director of the national theatre at Prague, is the creator and promoter of the Bohemian theatre, for which he has written 16 volumes of plays. Vincent Zahradnia, a clergyman, born in 1790, has distinguished himself by his fables. Tales and songs have been written by Winarecky, Kamaryt, Chmelensky, Marek, and Swobada, as well as Magdalena Retty, and the nun of St. Elizabeth, Maria Antonia.

Scientific subjects have been treated chiefly by J. Presl, director of the national museum at Prague, born in 1791, who has published several works on different branches of natural philosophy: works of a similar description have also been published by Charles Schadek and Professor Albert Sedlacek. Eminent service has been rendered to the national language by Joseph Jungman, professor of the university of Prague, by his great critical dictionary of the Bohemian language, on which he was occupied more than thirty years; he has published also 'Slovestnost,' or 'literature,' Prague, 1820; a history of the Bohemian literature, in 1825; besides many other compositions of less importance. Francis Palacky, born in 1798, is now one of the most accomplished writers of Bohemia; he has published several works on literary subjects, and made a particular study of the national history. The states of Bohemia commissioned him to write a complete history of Bohemia, and settled on him a pension for life, in order to enable him to devote himself entirely to the task: for that purpose he made extensive researches not only in his own country, but even abroad, and particularly in the archives of Italy. The result of his labours is a history of Bohemia, in German, of which two volumes, already published at Prague, bring it down to the extinction of the national dynasty of the Przemyslaus, 1306. It is founded on original documents chiefly in manuscript.

We shall conclude with a short notice of the most celebrated Slavonian living scholar, Paul Joseph Schaffaric, born in 1795, in Northern Hungary. After having gone through his preparatory studies in his native land, he completed them at the university of Jena, where he applied himself to divinity, metaphysics, general literature, and natural philosophy. His first work was a collection of the national songs of the Slovacks (Slavonians of Northern Hungary), published in 1819. He also translated into Bohemian the 'Clouds' of Aristophanes, and 'Maria Stuart' of Schiller. After his return to Hungary he diligently continued his Slavonian studies, and was appointed professor in and director of the Non-united Greek gymnasium at Neusatz, established by the Austrian government for its Servian subjects. He resigned however, in 1825, the direction of that school; but he retained the professorship till 1833. His residence in that place afforded him ample opportunities for the study of the dialects of the Southern Slavonians, Servians, Croatians, and Bulgarians, the result of which was his historico-critical researches on those dialects, which appeared in 1833, at Pesth, in German, under the title of 'Serbische Lesekörner,' &c. He had previously published in the same language a manual of the history of the Slavonian languages and literature, at Ofen, in 1826, which was well received. He also published in German, 1828, at Ofen, 'Researches on the Origin of the Slavonians,' which is a revised and enlarged edition of a similar work published in Polish by Surowiecki. Since 1833 Schaffarik has settled in Bohemia, and prosecutes his literary labours in the language of that country, in which he had published in 1818, conjointly with his friend the historian Palacky, 'Elements of Bohemian Poetry.' His principal work is his 'Slavonian Antiquities,' published in Bohemian, at Prague, 1837, a production distinguished by extensive learning, as well as sound criticism, and which has been received with unanimous approbation by the first scholars of all the Slavonian nations. Since 1838 he has edited the 'Journal of the National Museum of Prague.' He is now employed in publishing the monuments of the Servian and Bulgarian languages of the eighteenth century, and on an extensive history of the literature of all the Slavonian dialects.

Servian Language and Literature.—The Servian language has more resemblance to the Russian than to the Polish or Bohemian languages. It is considered more melodious than any other Slavonian dialect, a circumstance which is ascribed to the influence of the Greeks, by whom the Servians were converted to the Christian religion, as well as to that of the Italians, with whom they had many commercial relations. The dominion of the Turks was also not without influence on the Servian language. It has however preserved all the characteristics of other Slavonian languages. It is spoken by a population of about five millions, and it may be divided, according to Vook Stephanovich, into three dialects: 1, that of Herzegovina (comprehending Montenegro); 2, Resava; and 3, of Sirmia and Slavonia (provinces of Hungary). The Bulgarian language, which is spoken by about half a million of Slavonians, who inhabit Bulgaria and some parts of Macedonia, may also be considered a dialect of the Servian, although it differs in grammatical construction from all the other Slavonian idioms, being the only one which has adopted the article. The Servians, as well as the Bulgarians, make use of the Cyrillic alphabet. Some works, however, which have been recently published in Servia, are printed in the Russian character, with some slight alterations which are required by the peculiarities of the Servian language. A dictionary of this language, containing more than thirty thousand words, with a German and Latin translation, was published by Vook Stephanovich at Vienna in 1818. The same author published also a Servian grammar (Vienna, 1814), of which a translation, by J. Grimm, with a preface and annotations by Vater, appeared at Berlin in 1824.

The oldest monuments of Servian literature date from the thirteenth century, and are composed in the Slavonian idiom, which was employed in the version of the Scriptures by Cyrillus and Methodius, with some admixture of the language which is now spoken by the Servians. There is a great probability that the Slavonian of the Bible was originally in common use among the population of the present Servia, as it constituted a part of the kingdom of Great Moravia, where the Slavonian version of the Scriptures was made by Cyrillus and Methodius in the ninth century; but that it became by degrees estranged from its original, through the various revolutions to which that country was subject.

The monuments of the Servian literature to which we have alluded are, the 'Rodoslov,' that is, genealogical register, by Daniel, archbishop of Servia, which contains the history of the reigns of the kings Urosh, Dragutin, Milutin, and Dechanski (1272-1336). The manuscript is preserved in the monastery of Mount Athos. The Servian king (czar) Stephen Dushan the Great (1336-56) gave to his nation a code of laws, which bear a purer stamp of the Slavonian character than the laws of any other nations belonging to the same race, and are drawn up in a spirit of great moderation. There are also some religious books of the same period. The defeat of the Servians by the sultan Murad I. destroyed their national independence, and created in their literature a chasm of two centuries.

A new era for Servian literature was commenced by George Brankovich (born in 1645), who was ambassador of the emperor Leopold I. at Constantinople, but having afterwards fallen into disgrace with the court, died, in 1711, a state prisoner. He wrote in Slavonian a history of the Servians from their origin to the reign of the emperor Leopold I. The manuscript is preserved in the archiepiscopal library at Carlovitz. Many years however elapsed from the death of Brankovich before any other works were added to Servian literature. The archimandrite John Raich (1726-1801) wrote a history of the Slavonians in general, and of the Servians, Croatians, and Bulgarians in particular (four volumes, Vienna, 1792-95). It is composed in the Slavonian of the Bible, but much intermingled with Russian and Servian words.

The Servian was employed as a written language for the first time by Dositheus Obradovich (born in 1739), who, after having spent twenty-five years in different parts of Europe, died in 1811 at Belgrade, where he occupied the post of senator, and was at the same time tutor of the children of the celebrated Servian leader George Cherny. The example of Obradovich was only partially followed by other Servian authors; and it created such confusion in their literature, that among the 380 Servian works which had been published since 1750, only a few are written either in pure Slavonian or Servian, the remainder of them being written in a mixture of the two above-mentioned idioms, exhibiting a great variety of orthography and grammatical construction. This mongrel style was strongly combated by Demetrius Davidovich, secretary to Prince Milosh, who edited (1814-22) a Servian gazette and a Servian annual at Vienna. The same object has been successfully promoted by Vook Stephanovich Karadgich, who is the first Servian scholar of the age, and has rendered the greatest services to the language and literature of his country. He was born in 1786, in Servia. At an early period he devoted himself to the noble task of raising his native language to the same degree of perfection which has been attained by other Slavonian tongues, and he has promoted his object without intermission, particularly by his continual travels among all the populations which speak the different dialects of the Servian. After many efforts, he succeeded, with the assistance of Davidovich, in persuading the Servian writers to abandon the Slavonian of the Bible for the exclusive use of their national language. The greatest service which he has rendered to the literature of his country is the collection of national songs which he published at Leipzig in 1823. A German translation of these songs by Mrs. Robinson,* under the assumed name of Talvi, appeared at Halle in 1825. Some of these songs had already been known to the public through a collection of them made by the Franciscan monk Cacich Miossich, printed at Venice in 1759. The songs however published by Vook Stephanovich were chiefly collected by himself during his travels, and he added to them valuable critical and explanatory notes. These songs, inspired by the splendid scenery of Servia, the patriarchal life of the inhabitants, and the recollections of their eventful history, are considered the finest of all the Slavonian national songs. Full of the wildest romance, they admirably depict scenes of love and war, and express in the most animated manner feelings of a simple and tender, as well as of a glowing and impassioned character. Some of them belong to a period previous to the arrival of the Turks in Europe. Several allude to the seat of the Ottoman empire at Adrianople; whilst many are of a much more recent date, describing the oppression exercised by the Turks, as well as different scenes of intercourse with that nation. The same author published in 1836, at Cettigne in Montenegro, a collection of Servian proverbs, amounting to about 4000, with a preface, containing much valuable information on the Slavonian idioms spoken in the vicinity of the Adriatic; and he edited (1826-34) at Vienna five numbers of a Servian annual, called 'Danitza,' i.e. 'the morning star.' Simeon Milutinovich, born at Sarayevo in Bosnia, received some education in the gymnasium at Carlovitz in Hungary; and after having spent the early part of his life among very agitated and trying circumstances, which have perhaps contributed to develop his poetical genius, he received assistance from the Russian government, which enabled him to devote himself to literature. He composed a series of lyrical and heroic poems on subjects taken from the history of the Servian insurrection in 1804-15. These poems, which imitate the tone of the songs published by V. Stephanovich, appeared under the name of 'Serbianka,' at Leipzig, 1826, in 4 volumes, 12mo. He also added some new poetry, published at the same place in 1826 and 1827. All his productions are characterised by a bold originality, warmth of feeling, and a glowing patriotism. Having studied for some time at the university of Leipzig, he retired into Montenegro, where the metropolitan's patronage afforded him the means of pursuing literature. He collected there the national songs of Montenegro and Herzegovia, and wrote a history of Servia during the years 1804-1815. Both these works were published at Leipzig in 1837. Among the other Servian authors we may mention the present vladika, or metropolitan, of Montenegro, who is considered to be a very accomplished poet. Anna Obrenovich, niece of Prince Milosh, has published some works, original and translations.

---

* Mrs. Robinson is the wife of the Rev. Edward Robinson, professor and librarian at Andover College, Massachusetts, U. States, and well known as the editor of the 'Biblical Repository,' as well as the translator from German of several works relating to the study of the Scriptures and the author of a recently published work on Palestine. She is the daughter of Professor Jacob, author of several political works of considerable reputation. Having spent her early youth in Russia, where her father was successively employed (1807-1816) at the University of Kharkov and of St. Petersburg, she had an opportunity of learning the Russian language. After her return to Germany she devoted herself to literary pursuits. She became acquainted with Vook Stephanovich at Halle, and translated, with his assistance, the Servian songs mentioned in the text. Having married Mr. Robinson in 1828, she followed him to the United States, where she began to write English, and published several valuable articles on Slavonian literature in the 'North American Quarterly Review,' as well as a very valuable work on the same subject in the 'Historical View of the Slavic Languages,' Andover, 1834.

Prince Milosh Obrenovich has done much for promoting the education of his countrymen, having established sixteen schools for the training of teachers, and founded a printing-office at Kragoyevatz, the place of his residence. The Austrian government pays great attention to the education of its Servian subjects, for which purpose it has established gymnasia or higher schools at Karlovitz and Neusatz in Hungary. There are now Servian printing establishments, besides that of Kragoyevatz, at Vienna, Buda, Venice, and at Cettigne, the residence of the metropolitan of Montenegro.

A society for the promotion of Servian literature by giving prizes for the best works has been recently established, under the name of the 'Servian Mother,' and a periodical is published in the same language.

SLEAFORD. [LINCOLNSHIRE.]

SLEEP, the periodical repose of the organs of the senses, and of the greater number of the intellectual faculties and voluntary movements. The above indeed is by no means a satisfactory definition; but it is, as with life, far easier to describe its phenomena than to define its nature.

True sleep is peculiar to the mammalia and to birds; the lower animals, indeed, rest from time to time, and withdraw themselves from the external world, but having no external eyelids, they cannot exclude all influence from without. Fish conceal themselves behind a stone or near the bank of a river, crocodiles hide themselves in the mud, and tortoises creep into holes. The higher animals likewise usually seek out some place of retirement to sleep in, and dispose themselves in a posture which either is maintained with little muscular effort, or is favourable to the preservation of warmth.

The approach of sleep is announced by diminished activity of mind and loss of the power of attention. The senses become blunted to external impressions, and we feel an unconquerable desire for stillness and repose. Our ideas grow more confused, our sensations more obscure, our sight fails us, and if our ears still perceive sounds, they are indistinct, and seem as though distant. The eyelids close, the joints relax, we instinctively assume an easy position, and fall into a sleep, which at first is deep, then soft and gentle, and becomes gradually less sound as the time for waking approaches.

Physiologists are accustomed to distinguish what are termed the organic or vegetative from the animal properties of living beings. By the former are understood development, growth, excitability, &c., those powers in short which are common to plants and animals; by the latter, those properties which are peculiar to animals, such as sensation and voluntary motion. During sleep the organs of vegetative life continue to discharge their functions with scarcely less activity than in the waking state. Their repose is independent of sleep, and occurs at very different times. The heart rests between each pulsation, the muscles of expiration and inspiration are in a state of alternate action and repose, and the peristaltic motions of the intestines have their distinct periods of remission. The pulse and respiration however become slower during sleep, and digestion seems to go on then less perfectly than in the waking state. The temperature of the body sinks during sleep, owing to diminished nervous energy, and to the same cause may be ascribed the increased susceptibility of persons to rheumatism and other effects of cold when asleep.

Not only are the functions of organic life little affected by sleep, but even those of animal life are not in a state of complete repose. It would not be possible to make a dead body remain in those postures which we assume when asleep, and our eyelids are not closed except by muscular action. Some animals sleep standing, as the horse; birds do so also, sometimes standing on one leg. When very weary, we sleep even in the most constrained positions: soldiers have been known to sleep while marching, postilions on horsebask, and fiddlers at a fair have continued to play even when through weariness they had fallen asleep. The numerous instances of somnambulism on record shew how high a degree of activity of the animal functions is compatible with sleep. For remarks on this subject however, as well as on the condition of the senses during sleep, we refer to the article DREAMS.

Animals in general require less sleep than man; thus, for instance, four hours are sufficient for the horse. Those animals whose blood circulates very rapidly, whose motions are peculiarly energetic, and their senses very acute, usually sleep more lightly, and for a shorter time than others. The timid herbivorous animals sleep less, and less profoundly than the bolder carnivora. In man the want of sleep varies at different ages; the new-born infant sleeps almost continually, while persons in middle life can do with less sleep than children or very old persons, and women require less sleep than men. From six to eight hours a-day are usually passed in sleep, but habit exercises a great influence in determining the amount of repose required. John Hunter and Frederick the Great did not sleep for more than four hours daily, while some sluggish persons spend nearly half their time in sleep. In extreme old age much sleep sometimes becomes necessary. De Moivre, when eighty-three years old, was awake only during four hours out of the twenty-four, and Thomas Parr towards the close of his life was almost constantly asleep. Children sleep very soundly, old persons are easily disturbed, men sleep more profoundly than women, and sleep is always sounder after considerable weariness.

There are some conditions which favour the occurrence of sleep. Stout and full-blooded persons, and those of an excitable but easily exhausted frame, require more sleep than such as are thin, or who, though equally excitable, are more energetic, and less easily tired. Abundant food induces sleepiness, and also wine and other stimulants. A class of medicines are known by the name of narcotics, whose peculiar action is to induce sleep. Ease and quiet of mind conduce to it, but the weariness of hopeless grief is likewise followed by sleep. Certain external causes favour sleep, such as the warm bath or friction of the surface of the body. Extreme cold is a powerful and most dangerous narcotic; it induces a sleep from which there is no waking. Such a sleep it was which nearly proved fatal to Dr. Solander when with Sir J. Banks in Tierra del Fuego.

We have not yet noticed one very important character of sleep—its periodical return once in every twenty-four hours. The idle person sleeps as well as the diligent, who has passed his time in exerting his powers of mind or body. Sleep usually occurs at night-time, and we are awake during the day, but the day may become the time for sleep, and night for watching, if a person's occupations so require. Many animals sleep during the day, and watch or pursue their prey at night. We cannot then regard the periodical return of sleep as dependent on the simple alternation of day and night, or merely as the result of bodily fatigue, since it is known that extreme weariness will prevent sleep. The alternation of sleep and waking is essentially connected with something in the nature of animals, to which there are many analogies. The succession of the seasons and of day and night, the ebb and flow of the sea, the daily variations in the electricity of the air, in the rise and fall of the barometer, and the regular declination of the magnetic needle eastward and westward, at different hours, illustrate the same law of periodical action which is displayed in the unvarying alternation of sleep and waking. 'We may,' says Professor Müller, one of the most eminent physiologists of the present day, 'regard sleep and the waking state as the result of a species of antagonism between the organic and the animal life, in which the animal functions, governed by the mind, become free to act, while at other times they are repressed by the organic force acting in obedience to a law of creative nature. In sleep, when the animal functions entirely or for the most part cease, the organic processes are almost the only ones which continue, and during that state even the organs of animal life are rendered capable of renewed action by the organising force which proceeds without the consciousness of the animal, though accordant with a well-constituted plan and with reason.'

Little need be said of the uses of sleep. 'Nature's soft nurse,' it invigorates body and mind when worn out by toil, and the occurrence of sleep in the course of a disease is one of the most favourable signs of returning health. After a night's sleep we are nearly an inch taller than before; the intervertebral cartilages, which had been compressed by bearing the weight of the body during the day, having regained their natural form and proportions. The powers exhausted by our intercourse with the external world, recover themselves during sleep, and our senses in the morning are alive to all impressions. It is however preeminently the rest of the brain, which, when fatigued by the constant action of the mind, becomes incapable of continuing that action, just as the eye, if long fixed upon one spot, ceases to perceive any object distinctly.

Since then sleep is not a mere torpor of the system induced by fatigue, long watching, or any external cause, but a natural state whose periodical recurrence is essential to the harmonious performance of our functions, it need excite in us no surprise to find that in certain animals this condition lasts for a long time, even for months; and that in it the activity of the organs of animal life is suspended more completely than in diurnal sleep. To this state the name of

Winter Sleep, or Hybernation, is applied. Hybernation occurs in some mammalia, in all the amphibia, and in some of the molluscous and insect tribes. Birds do not hybernate, and the vulgar notion with reference to the sleep of the swallow in winter is erroneous. Hybernation is either perfect or imperfect. In the former, of which the marmot affords an instance, the lethargy is profound and undisturbed by any sense of thirst or hunger, and the animals do not awake until the period of sleep is completely past. In the latter, intervals of wakefulness occur, during which the creatures rouse themselves and seek for food, as in the case of many insects and spiders, also the hedgehog, bat, and dormouse. The time during which hybernation continues varies much. In some animals it lasts for four months only; in others for five or six; but almost all awake either in March or April. The situations which animals select for hybernation, and the position in which they await it, differ, as might be expected, in accordance with their various habits, but all seem to subserve one great purpose, the preservation of a moderate and equable temperature. Most creatures hybernate in solitude, but some, as the marmot, pass the winter in company.

The approach of winter sleep is not sudden, but it comes on gradually; the activity of the animals diminishing as their sense of hunger grows less keen. In some animals, as in the hedgehog, a diminution or total loss of appetite precedes hybernation for some weeks. When hybernation is perfect, the senses become so completely blunted, that severe wounds and electric shocks are insufficient to rouse the animal.

The phenomena of organic life go on far more sluggishly during hybernation than in diurnal sleep. The pulsations of the heart sink to a fourth or even a tenth of their natural frequency. The respiration becomes slow, intermits frequently and for a long time, or even becomes altogether imperceptible. An animal in this condition, if placed in a pneumatometer, will produce no change in the air which it contains, or may be kept for a considerable time in irrespirable gases without sustaining any inconvenience. The temperature of the body depends on the activity with which respiration and circulation are carried on; hence during hybernation it sinks greatly, and in some animals is not higher than that of the surrounding atmosphere.

Hybernation is not mere torpor from cold; all animals may be benumbed by cold, but those which hybernate are comparatively few in number. A moderately low temperature indeed is favourable to hybernation, but instinct teaches the animals to defend themselves from the cold, and their death results from exposure to its severity. Suspended animation from cold is a morbid state; hybernation and sleep are preceded by similar phenomena, and both terminate alike, after a certain time, in renewed activity.

If, lastly, we inquire what uses are answered by winter sleep, we shall see that it is a provision for the maintenance of life at a season when those animals in which it occurs would be unable to obtain their natural food. It serves likewise for their protection against a degree of cold to which they could not bear to be exposed. Nor is it merely against extreme cold that annual sleep and the instinctive preparations of animals for that condition supply a defence, but extreme heat is followed in some animals by a lethargy similar to hybernation. Thus the Tanrec, or rat of Madagascar, sleeps during the height of summer. Changes in the system generally, and renewed activity of the various functions, follow hybernation, as they do diurnal sleep. It would lead us into discussions beyond our limits, if we were to examine the various peculiarities of hybernating animals, or to inquire into what may be termed the proximate cause of annual sleep.

The revolutions of the seasons produce changes in plants not unlike those which we have just noticed in hybernating animals. There is however a still closer analogy between diurnal sleep and the so-called

Sleep of Plants, a condition first discovered by Linnæus to be general, though some of the phenomena had long been noted in the tamarind-tree, and in some leguminous plants with pinnated leaves, natives of Egypt.

The attention of Linnæus was called to this phenomenon by the following circumstance:—Having sown some lotus seed, he watched the progress of the plants, and at length discovered upon one of them two flowers. When evening came, he could not find the flowers again, and supposed that some one had plucked them. On the following morning he again observed them, and they once more disappeared at evening. He then examined the plants with care, and saw that at evening the leaflets had approached each other, and thus concealed the flowers from view. Struck by this fact, he took a lantern in his hand and visited his flower-beds, when to his surprise he found the appearance of all things changed, and thus discovered the sleep of plants.

As night approaches, flowers close, the leaves of plants become more erect and fold themselves together, while vitality seems to retire from the periphery. Thus during sleep the leaves of the sensitive-plant lose their peculiar sensibility, which retires to the petiole. With the approach of night too an important change takes place in the functions of plants, for instead of exhaling oxygen and absorbing carbon from the atmosphere, as in the day time, their action at night is directly the reverse.

The sleep of plants usually occurs at night time, owing to the withdrawal of the stimulus of light, to which they are subjected during the day. The experiments of De Candolle indeed have proved that by producing artificial day and night it is possible to change the time for the sleep and waking of plants. There must however be some cause of sleep more intimately connected with their organism than the mere withdrawal of light; for not only are there plants which, like certain animals, sleep through the day and are awake at night, but it has been ascertained that the leaves of plants kept constantly in the dark open and close at regular intervals, as during sleep.

Much information concerning sleep and hybernation will be found in Müller's 'Physiology,' translated by Dr. Baly, vol. ii., p. 1410, &c.; in the article 'Hybernation,' by Dr. M. Hall, in the 'Cyclopædia of Anatomy and Physiology;' and in the 'Dictionnaire des Sciences Medicales,' under the word 'Sommeil.'

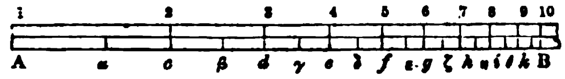
SLEEP OF PLANTS. [SLEEP.]

SLEEP-WALKING. [SOMNAMBULISM.]

SLESWICK. [SCHLESWIG.]

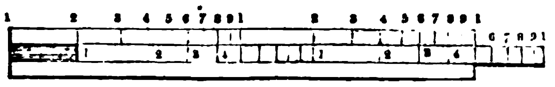
SLIDE (or SLIDING) RULE. The sliding-rule is an instrument for the mechanical performance of addition and subtraction, which is converted into an instrument for the mechanical performance of multiplication and division by the use of logarithmic scales, instead of scales of equal parts.

This instrument has been greatly undervalued in our country, in which it was invented, and is very little known on the Continent: for though a French work on the subject, published in 1825, which is followed by the writer of a very recent mathematical dictionary in the same language, assures us that in England the sliding-rule is taught at schools at the same time with the letters of the alphabet, we feel safer in saying that nine Englishmen out of ten would not know what the instrument was for if they saw it, and that of those who even know what it is for, not one in a hundred would be able to work a simple question by means of it. For a few shillings most persons might put into their pockets some hundred times as much power of calculation as they have in their heads: and the use of the instrument is attainable without any knowledge of the properties of logarithms, on which its principle depends.

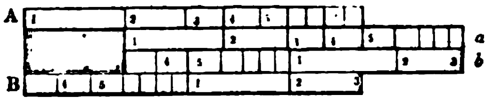


We have before us a logarithmic scale, of which AB, called the *radius*, may stand for the logarithm of 10, 100, 1000, &c.: but if AB should be, say the logarithm of 100, then A*c* is that of 20, A*d* of 30, and so on. If this scale be repeated several times, beginning again at B, and if it be also large enough to be subdivided to a greater extent than can be shown in the diagram, any multiplication can be approximately performed by addition, and any division by subtraction; which may be done with a pair of compasses. That is to say, the figures of the product may be found, exactly or approximately, and the meaning of the figures must be settled from the known character of the result. For example, to find 4 times 15·—First let AB mean the logarithm of 100, then A*a* is that of 15: next let AB mean the logarithm of 10, then A*e* is that of 4. Take A*a* on the compasses, and set it on to the right of *e*; it will be found that the point *g* is attained, directly under 6. But 4 times 15 must be tens; therefore 60 is meant, or $4\times15=60$. Next to divide 90 by 45: from A*k* take A*δ*, or set off A*δ* from *k* towards the left. The point *c* will be attained, under 2, which is the quotient. Next to find 7 times 5; set off A*f* from *h* towards the right, and the point γ of the scale following B will be attained, and 35 is the answer. But had it been to multiply 7 by ·5 or 5-tenths, this 35 would have meant 3·5 or 3½. Attempts are made in works professing to explain the sliding-rule to give rules for the determination of the character of the figures in the answer, but without any success. It is all very well for a few chosen examples, but an attempt to do without the book soon shows the insufficiency of rules. If, on a large scale, 653 should be the figures of an answer, common sense, applied to the problem, must say whether it is ·0653, ·653, 6·53, 65·3, 653, 6530, 65300, &c. which is meant. A knowledge of decimal fractions is therefore indispensable.

Now these additions and substractions might be performed by a pair of rulers made to slide each along the other; but whether they are kept together by the hand, or whether the one ruler slides in a groove along the edge of the other, matters nothing to the explanation. The following diagram represents the two rulers in one relative position. Here 1 on the slide is made to match 2 on the fixed ruler, and the instrument is now in a position to multiply by 2, to perform every division in which the quotient is 2, and to work every question in the rule of three in which the ratio of the first term to either the second or third is that of 2 to 1, or of 1 to 2. And here let us observe, that much the best way of beginning to use the sliding-rule is not by working given questions, but by setting the slide at hazard, and learning to read the questions which are thus fortuitously worked.

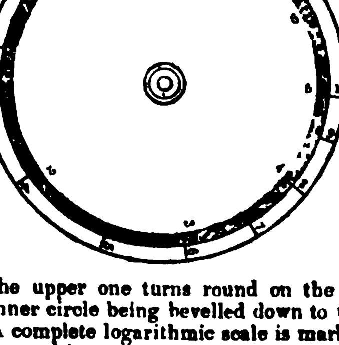


In the cut before us we have the 1 of the slide placed at 2 of the fixed ruler; consequently 6 on the slide comes under what would be 12 of the fixed ruler if the secondary graduations were inserted. Again, 4 comes over 2, and 9 over 45, giving 4 : 2 : : 9 : 4·5, the decimal point being inserted by intuition. To show the sort of results which we obtain from such a slide of 5½ inches radius (or from 1 to 1), we take one of this sort, and throw 1 of the slide at hazard between 225 and 230 on the fixed ruler, a little farther to the right than it is on the preceding diagram; guessing at the interval, it seems 228·5. We detect it more exactly by looking at 5 on the slide, which is hardly visibly in advance of 114 on the scale. As far then as the divisions, aided by our judgment of this interval, inform us, we have $114\div5=22{\cdot}85$, the truth being 22·8. Again we find 628 (fixed) just over 275 (slide), the 8 being estimated: hence, by the scales we learn that $628\div275=2{\cdot}285$: the truth being 2·2836. Thirdly, we estimate that 1725 (fixed) falls over 757 (slide), and that 276 (fixed) falls over 121 (slide). That is, the ruler informs us that 1725 : 757 : : 276 : 121; the fourth term should be 121·12, as found by computation. We take a larger scale, having 7½ inches of radius, and setting 1 on the slide to 228·5, we find 1725 appears to fall over what we should judge to be 756 rather than 757. Now $1725\div757=2{\cdot}2787$, and $1725\div756=2{\cdot}2818$. Both give on the scales 2·285, so that the advantage is slightly in favour of the larger scale, but not so much as we should have expected. We now try one of 24 inches radius, and setting 1 on the slide to 2·285 on the fixed ruler, we find that 1725 (fixed) falls over 754·7 (slide), the last 7 being estimation. Now $1725\div754{\cdot}7=2{\cdot}2857$, which gives the advantage again (but not so decidedly as might have been expected) to the large rule. The fact is, that it is rather ease than proportionate accuracy which is gained by the large rules: the preceding results required care and close attention on the 5½-inch rule; were obtained with moderate care on the 7½-inch; and taken off instantly from the 24-inch rule. Moreover, divisions on wood, made in the usual way, do not allow accuracy to increase with the size: if these rulers were divided on brass, and with the precautions taken in astronomical instruments, it would be a very different thing; but after all, the wonder is that the common wooden rules should be so accurate as they are.



The next step in the description is as follows:—It matters nothing whether the second scale be really made consecutive with the first, or occupy any other part of space, provided that when 1 and 1 are brought together on the first scale, 1 and 1 also come together on the second, and that the first slide and its continuation slide equally. We see this in the diagram before us: *a b* is one slide, and A B are two rulers on opposite sides of the groove. When *a b* is pushed home, A and *a* present coinciding scales, as do B and *b*: we should rather say, that the last is not one scale, but the end of one and the beginning of another; the 1 of B and *b* being in the middle. The consequence is, that as long as 1 of the scale *b* is not pushed out so far as to fall out of the groove (which is never necessary, since there is a whole scale on B), there is always the power of reading every result of the multiplication in hand. In the diagram, 1 on *b* is pushed out to 2 on B, and on the upper scales (A and *a*) we see $2\times2=4$, $2\times3=6$, $2\times4=8$, $2\times5=10$; on the lower (B and *b*), $2\times4=8$, $2\times5=10$, $2\times6=12$, $2\times7=14$, $2\times8=16$, $2\times9=18$, $2\times10=20$. This modification was invented by Mr. Silvanus Bevan (Nicholson's *Journal*, vol. xlix., p. 187); but thirty years before this Mr. Nicholson (*Phil. Trans.*, 1787, p. 246) had pointed out how to divide the whole radius into four parts, two on each face.

But the most simple plan, and, but for difficulty of dividing, the best, is to make a revolving circle turn upon a fixed one, in which case the scale is its own continuation, as in the following diagram. The two circles have a common pivot, and the upper one turns round on the lower; the rim of the inner circle being bevelled down to the plane of the lower. A complete logarithmic scale is marked on each circumference, and it will readily be seen that the scales are



placed so as to point out multiplications by 2, as in the former instances, and also that the recommencement of the scale begins its continuation. Instead of two circles there might be two thin cylinders, turning on a common axis, the graduations being made on the rims. Twelve or fifteen years ago, an instrument-maker at Paris laid down logarithmic scales on the rims of the box and lid of a common circular snuff-box; one of two inches diameter would be as good an aid to calculation as the common engineer's rule. But either calculators disliked snuff, or snuff-takers calculation, or the scheme was not found to answer, and the apparatus was broken up. There can, we think, be little doubt that when the knowledge of this instrument is extended, and consequently its sale, a pair of well-graduated brass circles will be the form it will take.

The form first proposed by Oughtred (presently to be mentioned) was a modification of the preceding. Instead of two circles, two pointing radii were attached to the centre of one circle, on which a number of concentric circles were drawn, each charged with a logarithmic scale. These pointers would either move round together united by friction, or open and shut by the application of pressure: they were in fact a pair of compasses, laid flat on the circle, with their pivot at its centre. Calling these pointers antecedent and consequent, to multiply A and B the consequent arm must be brought to point to 1, and the antecedent arm then made to point to A. If the pointers be then moved together until the consequent arm points to B, the antecedent arm will point to the product of A and B.

It will be observed that in every construction the logarithmic spaces are very unequal, those near the end of the scale being small when compared with those at the beginning. This is not so great a disadvantage as might be supposed, for it makes the liability to error increase in nearly the same proportion with the result, so that the *per-centage* of error in the sliding-rule is nearly the same thing in all its parts. *For example*, the scale going from 10 to 100, the interval from 10 to 11 is to that from 99 to 100 as 207 to 22, nearly in the proportion of 10 to 1. The tendency to absolute error will be inversely as these intervals, or nearly in the proportion of 1 to 10; the tendency to error is therefore about ten times as great precisely when the result estimated becomes ten times as great. Oughtred appropriated two circles to his logarithms of sines, and it would be easy in his construction of the 'circles of proportion,' as he called them, to distribute the scale among different circles in such a manner that the graduations should be nearly equal throughout. But the mathematician will easily see that the most perfect mode of developing this idea would be to lay down the scale on a revolution of a logarithmic spiral, having the pointers joined at its pole. The graduations would then be absolutely at equal distances from each other on the arc of the spiral.

Another modification of the principle of the sliding-rule is as follows:—Let the divisions be all made equal, and the numbers written upon the divisions in geometrical proportion. If this were done to a sufficient extent, any number might be found exactly or nearly enough upon the scale; the only difficulty being that very small divisions do not give room enough to write the numbers. This modification of the principle has been applied in two very useful scales by Mr MacFarlane. In the first, two cylinders moving on the same axis, on one side and the other of a third, give the means of instantaneously proposing and solving any one out of several millions of arithmetical questions for the use of schools and teachers. In the second, one circle revolving upon another gives the interest upon any sum, for any number of days, at any rate of interest under ten per cent.

The rules for using the sliding-rule, in its most simple form, may be symbolically expressed in the following manner:—

1	B	A	B	A	C
A	AB	1	B÷A	B	C×B÷A

Thus, if 1 on either ruler be brought opposite to A on the other, B on the first ruler is brought opposite to AB on the other. But if the slide be taken out and inverted, we have the following rules:—

1	B	A	B	A	C
A	A÷B	1	A÷B	B	A×B÷C

We now proceed to some of the additions which are frequently made to sliding-rules, premising that we do not describe any one in particular, but refer for detail to the treatises which are afterwards cited. For the extraction of square or cube roots, or the formation of squares or cubes, the following method is adopted:—In the case of squares and square roots, *for instance*, there is a pair of scales, one on the slide and one on the fixed ruler, of different radii, the radius of one being twice as long as that on the other: for cubes and cube roots the radius of one is three times as long as the other. On the former scale (that of squares and square roots) the rules are now as follows:—

Longer Rad.	1	A	√A	1	B	√(B÷A)
Shorter Rad.	1	AA	A	A	AB²	B
	A	B	A√B	A	C	A√(C÷B)
	1	B²÷A²	B	B	BC²÷A²	C

The denomination of the answer, or the place of the decimal point, must be determined by independent consideration, as before; but there is one circumstance to be attended to in every case in which two of the data are to be read on the shorter scale. For example,* suppose it is required to calculate √(2÷7). By the second formula, 7 on the shorter scale is placed opposite to 1 on the longer, and 2 on the shorter scale is then opposite to 1690 on the longer. The answer from the scale is then ·1690, to all appearance; but this is *not* √(2÷7), but √(2÷70). The place on the longer scale which should give the answer has no slide opposite to it, but only empty groove. But mark where 1 on the shorter scale is opposite to a part of the longer (between 110 and 120), and push the slide in from left to right till the first 1 on the shorter scale comes where the second now is; then look under the second 2 of the shorter scale, we have 534; and ·534 is the true answer as far as the scale will give it. We have taken the most straight-forward plan of reading the rule, and have not space for all the details which are in works on the subject, particularly the method of using the slide of numbers with a scale of numbers above and of square roots below. The following is the general principle applicable to the preceding case:—

It is well known that whereas in common division the place of the decimal point has nothing to do with the significant figures of the quotient; yet in extracting the square, cube, &c. roots, the figures of the root are altered by a change of the decimal point, unless it be changed by an even number of places in extracting the square root, by three or a multiple of three places in the cube root, and so on. In extracting the square root, a number may either have two figures in its first period, or one; thus ·07610 and ·7610 must (in the rule for extraction) be pointed

$$\cdot0\dot{7}6\dot{1}0\dot{0} \quad\text{and}\quad \cdot\dot{7}6\dot{1}0.$$

Let us call numbers *unidigital* or *bidigital*, according as there are one or two significant figures in the first period. Then the application to the sliding-rule is, that on the shorter scale numbers of the same name must be read either on the same radius or with a whole radius intervening, while numbers of different names must be read on different radii. In the scale for the extraction of the cube root, numbers must be distinguished into unidigital, bidigital, and tridigital; and signifying these by their initial letters, and taking the succession UBTUBT, &c., there must be the same relation between the scales on which they are read that there is between the places of their letters in the preceding list. Thus if U be read on one radius, T must either be read on that immediately preceding, or on the next but one. Thus in the preceding question, which we first solved wrongly, we have 2 and 7 to consider on the shorter scale, the pointing of which is—

$$\dot{2}\cdot0\dot{0}0\dot{0} \quad\text{and}\quad \dot{7}\cdot0\dot{0}0\dot{0},$$

and both are unidigital numbers. Bringing 7 on the shorter scale to 1 on the longer, we see that the next 2 is on a different radius: it would do then for 70, or ·7, or ·007, but not for 7. By the process we followed we took not indeed a 2 on the same radius with our 7, but on the next radius but one; and thus obtained the correct answer. These points, and others (such as the meanings of the lines of sines, tangents, &c., annuities, &c., which are found on several rules) can only be mastered by those who are acquainted theoretically with logarithms, trigonometry, &c.; for after all the sliding-rule will not teach the method of working any question, but will only afford aid in computation—in common multiplication and division, to any one; in higher rules, to those who understand their principles. Oughtred, the inventor, kept the instrument by him many years, out of a settled contempt for those who would apply it without knowledge, having 'onely the superficiall scumme and froth of instrumentall trickes and practises:' and wishing to encourage 'the way of rationall scientiallists, not of ground-creeping Methodicks.' A little distinction between that portion of its use which is generally attainable, and that which requires mathematical knowledge, would have been more reasonable.

---

* The reader will not understand this, unless with the scale in his hand. The common carpenter's rule, or Bevan's rule will do, in which two consecutive radii are on the shorter scale, and one radius of twice the length on the longer.

On the carpenter's and engineer's sliding-rule are engraved a number of numerals in columns with headings, of which the following is a specimen:—

	SQUARE.			CYLINDER.		GLOBE.	
	FFF	FII	III	FI	II	F	I
CAST IRON	·0022	·323	3·878	·411	4·935	·0043	7·406

These divisors (called gauge-points) are intended to convert into pounds the weight of a rectangular prism, cylinder, or globe, of cast-iron; the first, on three suppositions, namely, all dimensions in feet, one in feet and two in inches, and all in inches; the second, on the suppositions that the length is in feet and the diameter in inches, and that both are in inches; the third, on the supposition that the diameter is either in feet or in inches. We shall here content ourselves with verifying one of these, say the first of those marked 'cylinder,' which will show the nature of the divisor.

The specific gravity of cast-iron is 7·207, and the content of a cylinder of D *inches* diameter and L *feet* of length is $·7854 \times D^2L$ divided by 144, in cubic feet. A cubic foot of water weighs 62·321 pounds avoirdupois; one of cast-iron therefore weighs $62·321 \times 7·207$; whence the weight of the cylinder is, in pounds,

$$62·321 \times 7·207 \times ·7854\, D^2L \div 144, \text{ or } \frac{D^2L}{G};$$

$$\text{where } G = \frac{144}{62·321 \times 7·207 \times ·7854}, \text{ or } ·4082;$$

near enough to ·411 to illustrate our object, but showing that the computer of this divisor used a specific gravity slightly differing from the above. The rule in all the cases is to multiply the three dimensions together, diameters or lengths, and to divide by the divisor given in the table. The term gauge-point, which properly belongs to the part of the scale on which the divisor is marked, has passed to the divisor itself.

The following list of sliding-rules, now on sale in London, contains all or nearly all which can be useful to any one:—

1. Common Engineer's Rule, or Carpenter's Rule in its best form. A double 12-inch rule, a slide of two radii with the same scale on one side, and a scale of one radius of double length on the other, with divisors (sold by all rule-makers). The newest description is Kentish's 'Treatise on a Box of Instruments,' &c., London, 1839.

2. Bevan's Engineer's Rule, 12 inches. Has slides on both faces (which may be exchanged), and serves for squares, cubes, square roots of cubes, &c. There are scales on the backs of the slides and in the grooves, for sines, tangents, inverted numbers, compound interest and annuities at 5 per cent. (Cary, Strand; with an explanatory treatise.)

3. Henderson's Double-Slide Rule, 12 inches. Has two parallel contiguous slides, with scales of numbers fixed above and below, and solves at one operation most sets of multiplications and divisions not exceeding five operations. At the back are tables of divisors for solids. (Jones, Holborn.)

4. Woollgar's Pocket Calculator, 8 inches. The two slides work in either of the grooves: the backs and the grooves have scales of sines, tangents, areas of polygons, circular segments; interest, annuities, certain and for lives, at several rates of interest. An addition may be made by a metal slip, giving the solution of the same questions as the last rule. (Rooker, Little Queen Street; with an explanatory tract.)

5. Woollgar's Pocket-Book Rule, 6 and 8 inches. Two radii, one under the other, as described in the preceding part[*] of the article; a line for sines, and duplicate proportions at the back of the slide. At the bottom of the groove are sometimes inserted lines for finding the relations of right-angled triangles, for cask-gauging, and for cuttings and embankments. (Rooker.)

6. Excise Officer's Sliding Rule, modern form. Sold at the Excise Store-office, and by some of the instrument-makers. The old Excise rule was a thick block, with a slide on each face.

Among separate treatises not yet noted are Flower's, 8vo., London, 1768; Mackay's, 8vo., 2nd edit., London, 1811; do., Leith, 1812; 'Instruction sur la Manière de se servir de la Regle à Calcul.,' petit-in-8vo., Paris et Dijon, 1825; 'The Universal Ready-Reckoner,' by an Idle Gentleman, 12mo., London, 1839; and there is a good deal on the subject in Ingram's 'Concise System of Mathematics,' 12mo., Edinburgh, 1830; and Bateman's 'Excise Officer's Manual,' 12mo., London, 1840.

Between the sliding-rule and the book of logarithms comes the card of four-figure logarithms, published by Messrs Taylor and Walton (explained in the 'Companion to the Almanac' for 1841), to which has very recently been added a similar card for sines and tangents. A sliding-rule which would *in all parts* compete with these tables in accuracy must have a radius of from 8 to 10 feet, and would be unmanageable. At what length the card begins to be more easily used than the rule we cannot determine, but we should suspect that the former would be preferable to a rule of four feet radius. We have found the rule of 24 inches extremely useful in checking the material figures of more minute calculations, particularly when there are many divisions by the same divisor.

The history of the sliding-rule, had it ever been properly given, would be matter for a few lines of our work, in the way of abbreviation and reference. As it is, we have not only to establish the main points, but also to point out a specimen of the manner in which the account of early English science has been written. Harris's 'Lexicon Technicum' (1716) informs us that sliding-rules 'are very ingeniously contrived and applied by Gunter, Partridge, Cogshall, Everard, Hunt, and others, who have written particular treatises about their use and application.' Stone's 'Mathematical Dictionary' (1743) has the same words. Dr. Hutton (*Math. Dict.*, 1815) informs us that they are variously (not ingeniously) contrived and applied by different authors, particularly Gunter, Partridge, Hunt, Everard, and Coggleshall. Other writers repeat this sentence in their own ways, and the summing up is this:—the recognised history of the sliding-rule consists in the names of five persons; all our best English authorities are unanimous in stating that these men 'contrived and applied' sliding-rules, either ingeniously or variously; but to the credit of this century be it spoken, that it was our historian who altered the chronological order, and spelt Coggleshall's name right: had it not been for the research of Dr. Hutton, it might have been Cogshall to this day.

We now go on to something more like history. It is generally stated that Gunter invented the sliding-rule. This is not correct; Gunter neither invented this rule nor wrote about it; and though he was the first (*On the Crosse-staffe*, book i., cap. 6) who used a logarithmic scale, it was in the manner described at the beginning of this article, compasses being used to make the additions and subtractions. Gunter's rule is used up to the present time, under that name, in the navy, without any slides.

The real inventor of the slide was OUGHTRED, who was also the first writer upon it. He was a man who set but little value upon instrumental aids, unless in the hands of those who had previously learned sound principles, which (as we have seen) he himself testifies. In the year 1630 he showed it to his pupil William Forster, who obtained his consent to translate and publish his own description of the instrument, and rules for using it. This was done under the following title: 'The Circles of Proportion and the Horizontal Instrument,' London, 1632; followed, in 1633, by an 'Addition, &c.,' with an appendix, having title, 'The Declaration of the Two Rulers for Calculation.' The following extract from W. Forster's[*] dedication to Sir Kenelm Digby will explain the whole:—

'Being in the time of the long vacation 1630, in the Country, at the house of the Reverend, and my most worthy friend, and Teacher, Mr. William Oughtred (to whose instruction I owe both my initiation, and whole progresse in these Sciences), I upon occasion of speech told him of a Ruler of Numbers, Sines, and Tangents, which one had be-ruler to be made (such as is usually called Mr. Gunter's Ruler) 6 feet long, to be used with a payre of beame-compasses. He answered that was a poore invention, and the performance very troublesome: But, said he, seeing you are taken with such mechanicall wayes of Instruments, I will shew you what devises I have had by mee these many yeares. And first, hee brought to mee two Rulers of that sort, to be used by applying one to the other, without any compasses: and after that he shewed mee those lines cast into a circle or Ring, with another moveable circle upon it. I seeing the great expeditenesse of both those wayes, but especially of the latter, wherein it farre excelleth any other Instrument which hath bin knowne; told him, I wondered that he could so many yeares conceale such usefull inventions, not onely from the world, but from my selfe, to whom in other parts and mysteries of Art he had bin so liberall. He answered, That the true way of Art* is not by Instruments, but by Demonstration; and that it is a preposterous course of vulgar Teachers, to begin with Instruments, and not with the Sciences, and so in stead of Artists, to make their Schollers onely doers of tricks, and as it were Juglers: to the despite of Art, losse of precious time, and betraying of willing and industrious wits unto ignorance, and idlenesse. That the use of Instruments is indeed excellent, if a man be an Artist: but contemptible, being set and opposed to Art. And lastly, that he meant to commend to me the skill of Instruments, but first he would have me well instructed in the Sciences. He also shewed me many notes, and Rules for the use of those circles, and of his Horizontall Instrument (which he had projected about 30 yeares before) the most part written in Latine. All which I obtained of him leave to translate into English, and make publique, for the use, and benefit of such as were studious, and lovers of these excellent Sciences.'

---

[*] The maker of this slide has them of various lengths up to 24 inches.

[*] This man must not be confounded with the Gresham professor of the name; nothing more than his connection with Oughtred is known of him. The one whose name is so much connected with Gunter is Samuel Foster (died 1652), Gresham professor of astronomy.

Oughtred gave his right in the invention (as soon as it was settled to be published) to Elias Allen, a well-known instrument-maker, near St. Clement's church, in the Strand. In walking to and fro from this shop, he communicated his invention to one Richard Delamain, a mathematical teacher whom he used to assist in his studies. This Delamain not only tried to appropriate the invention to himself, but wrote a pamphlet of no small scurrility against Oughtred, which the latter answered in an 'Apologeticall Epistle' fully as vituperative; which epistle was printed at the end of W. Forster's translation. It contains some quantity of biographical allusion, and must not be forgotten by a mathematical historian of the times. W. Forster's work was republished in 1660, by A. H. (Arthur Haughton, another pupil of Oughtred), with Oughtred's consent, but the dedication and epistle were omitted.

The next writer whom we can find is Seth Partridge, in a 'Description, &c. of the Double Scale of Proportion,' London, 1662. He studiously conceals Oughtred's name: the rulers of the latter were separate, and made to keep together in sliding by the hand; perhaps Partridge considered the invention his own, in right of one ruler sliding between two others kept together by bits of brass. Coggeshall's ruler was made in both ways, that is, with the rulers attached and unattached; it appears to have come in at the end of the seventeenth century. Since that time several works have been written, and various modifications of the rule proposed. Ward (*Lives of Gresham Professors*) is incorrect in saying that Wingate carried the sliding-rule into France in 1624; it was Gunter's scale which he introduced there. In fact the slide was little used and little known till the end of the century. Leybourn, himself a framer of instruments, and an improver (as he supposed) of the sector, has 30 folio pages of what he calls instrumental arithmetic in his 'Cursus Mathematicus' (1690), but not one word of any sliding-rule, though he puts fixed lines of squares and cubes against the line of numbers in his version of Gunter's scale.

Finding so meagre an account on this matter in publications professedly mathematical, we did not at first think of having recourse to any others. When we had finished the preceding, however, we thought of consulting the 'Biographia Britannica,' and there we found, in the middle of a very full life of Oughtred, the whole account of the invention of the sliding-rule, exactly as above, and from the same authorities. On looking at Dr. Hutton's account in the Dictionary, we perceive that he has either used this memoir or some copy of it; but without giving any information on the subject of the present article.

We shall conclude this article by some account of a new species of sliding rule, invented by Dr. Roget (*Phil. Trans.* for 1815), which would be very useful in the hands of writers on statistics, and would sometimes save much trouble to the mathematician. The slide contains a common logarithmic line of two radii, each 10 inches in length. The fixed ruler has not logarithms, but logarithms of logarithms denoted by its spaces. For instance, reckoning from 10 (remembering that log log 10 = 0), the space from 10 to 100 is log log 100, or log 2, the same space as from 1 to 2 on the slide. And since log log x is positive or negative, according as x is greater or less than 10, we have the *logo-logarithms* laid down on the left for numbers less than 10, and on the right for numbers greater. This instrument is constructed by Mr. Rooker (Little Queen Street), and in this manner: 10 is on the middle of the upper ruler, which ends on the right at 10_{10}, or ten thousand millions; and on the left at 1·25. At the extreme right of the lower ruler we find 1·25 again, from which we revert to 1·0233 on the extreme left. The upper and lower rulers are so adjusted that from the end of one to the beginning of the other it is exactly two radii, so that a setting on the upper ruler applies also to the lower, but it may be necessary first to slip the slide a whole radius forwards or backwards, in the manner described in the preceding part of the article. And here again the meaning of the reading on the slide must frequently be determined by common sense applied to the problem.

When 1 on the slide is placed opposite to a on the ruler, we have b on the slide opposite to a^b on the ruler. Or using the preceding notation:—

Rule	a	a^b	a	$\sqrt[b]{a}$	a	$\sqrt[b]{a^c}$
Slide	1	b	b	1	b	c

The approximations of this rule are equally easy whether applied to fractional or integer exponents, and Dr. Roget justly observes that it gives a much better idea of the rapid increase of powers than simple reflexion. It is so little known even to mathematicians, that we put down some of its results as specimens of its powers. Set 1 on the slide opposite to 3·14 on the rule, and we find for the approximate powers of this number by simple inspection 9·86, 31, 97, 306, 960, 3000, 9300, 29,500, 93,000, &c. The square root is 1·772, the cube root 1·465, the fourth root 1·331, the fifth root 1·257. We must now change the slide, as above directed, so as to put it in connection with the lower scale, and the proceeding roots are 1·210, 1·178, &c. All questions of increase of money, population, &c. are in this manner reduced to simple inspection, and very easy trial gives that approximate solution of exponential equations which the mathematician must find before he applies his more extensive methods. Thus, to form the table of logarithms in SCALE (p. 506) the base of which is $\sqrt[12]{2}$:—Set 12 on the slide opposite to 2 on the ruler, and the table is ready, as far as the instrument will give it. Thus, opposite to 3, 4, 5, &c. we find 19·0, 24, 27·9, 31·0, 33·7, 36·0, &c. almost exactly as in the table cited. It is also worth notice that each division of the upper fixed ruler answers to the hundredth power of the division directly beneath it on the lower fixed ruler. Thus, wishing to know what effect would be produced in 100 years upon a population which increases 3·46 per cent., we set unity to 1·0346 on the lower scale, and find at once 30·023 on the upper ruler, being the number by which the present population must be multiplied.

Mr. Woolgar (to whom we are indebted for much information in this article, and who has made a particular study of the sliding-rule) has carried to a considerable extent the principle of making the slide or the rule (no matter which) bear not the logarithms of the numbers marked on its graduation, but those of the values of a function of those numbers (*Mechanics' Magazine*, No. 849, vol. xxxii.). Let a slide be so graduated that the interval from a given point in the graduation x represents log ϕx. When x is then ascertained (by the common scale, if necessary), the formula $a\phi x$ is immediately deduced from the common scale and the new slide. Nor need there be a new slide: for any scale being laid down in the groove, the common slide, by having its end made to coincide with one or another division of the scale in the groove, may be rendered capable of answering the purpose of a new slide.

Since the above article was written, we have obtained from Paris a circular logarithmic scale in brass, altogether resembling the one figured and described in the preceding part of this article, with the addition only of a clamping screw. This instrument, the scale of which is 4½ inches in diameter, is so well divided that it will stand tests which the wooden rules would not bear without showing the error of the divisions. But here arise disadvantages which we had not contemplated. In the first place, no subdivision can be well made or read by estimation, unless the part of the scale on which it comes is uppermost or undermost, which requires a continual and wearisome turning of the instrument. In the next place, to make the best use of it, and bring out all its power, requires (we should rather say renders worth while) such care in setting and reading, as, unless a microscope and tangent screw were used, makes the employment of the four-figure logarithm card both shorter and less toilsome. For rough purposes, then, a wooden rule is as good; for more exact ones, the card is better. We made a fair trial of both on the tables in SOLAR SYSTEM, and are perfectly satisfied that though the French brass arithmometer did, with great care, bring out the results required, the four-figure card did the work more easily. But, had we wished to abandon two or three units in the last places of figures, there would then have been no doubt that the instrument would have been the easier of the two: but then a straight wooden rule of the same radius would have done quite as well, and been more convenient still. (*Mechanics' Magazine*, No. 949.)

---

* That is, in the old use of the word art; we should now say science. [SCIENCE.]

SLIGO, an Irish county in the province of Connaught, extending along the southern shore of that great inlet of the Atlantic Ocean which separates the provinces of Ulster and Connaught, and of which Donegal, Sligo, and Killala bays are subordinate parts. The county is bounded on the north by the sea, on the north-east by the county of Leitrim, on the south-east by that of Roscommon, and on the south-west and west by that of Mayo. Its form is tolerably compact: the greatest length is in a direction nearly east and west, from the junction of the three counties of Leitrim, Roscommon, and Sligo, to the mouth of the river Moy in Killala Bay, thirty-five miles; the greatest breadth at right angles to the length is from the village of Clossibawn, on the Atlantic, to the shore of Lough Gara, thirty-four miles. (*Ordnance Survey.*) The gross area, according to the Ordnance Survey, is 461,753 acres, or 721½ square miles; of which 12,740 acres, or 20 square miles, are loughs, leaving 449,013 acres, or 701½ square miles, of land. The gross area is about equal to the area of the English county of Worcester. The population, in 1831, was 171,765, which gave nearly 245 inhabitants to a square mile of land. It is the smallest and least populous county in Connaught except Leitrim, but the population is more dense than in any other except Roscommon. Sligo, the county town, is at the bottom of Sligo Bay, in 54° 18′ N. lat. and 8° 25′ W. long., 109 miles in a direct line north-west of Dublin, or 132 miles by the road through Lucan, Leixlip, Mullingar, Longford, Carrick-on-Shannon, and Boyle.

Coast-Line, Bays, and Islands.—The coast from the mouth of the river Moy, at the western extremity of the county, runs north-north-east seven miles in a tolerably direct line, forming the eastern side of Killala Bay, and terminating in Lenadoon Point. From Lenadoon Point the coast runs eastward to Cooanmore Head five miles, and then south-east for as much more, to the neighbourhood of the post-town of Dromore West, at which point it turns to the north-east, and runs twenty or twenty-two miles in that direction to the headland near the small harbour of Clossibawn or Classybaun, the outline being broken in this part by Sligo Bay. From the neighbourhood of Clossibawn the coast runs for about five miles first south, then east to the mouth of the little river Duff, which forms the boundary between this county and Leitrim. Except in Sligo Bay and along the coast eastward from it the shore is rocky. There are cliffs in some places on the shore of Killala Bay, and between Lenadoon Point and Dromore West, and near the entrance of Sligo Bay on each side, and again about the headland near Clossibawn. Off that part of the coast which extends north-eastward from Sligo Bay, distant between three and four miles, is Innis Murray, a small island, about a mile long from east to west. It rises precipitously on every side except just at the east point; and it is highest on the north and west sides (74 to 77 feet), where it faces the open sea. It contains about 209 acres of cultivable land, chiefly pasturage, and is inhabited by about a score families. About two or three miles farther out to sea are the Boabinshy rocks. Sligo Bay is nearly six miles across at the entrance, and about ten miles deep to the town of Sligo. On the south-west side of the entrance is Aughris Head, and on the north-east side is Roskeeragh Point. The bay is divided by projecting headlands into three smaller bays which penetrate inland in an east or south-east direction. The northernmost of these smaller bays is called Drumcliffe Bay: it is useless as a harbour from its being shallow, but has an oyster-bank on its northern shore near Lissadill House, which yields good oysters. The middlemost bay is that at the bottom of which the town of Sligo stands; it is in great part occupied by a large bank called Cummeen Strand, but has a channel navigable up to Sligo town for vessels of small burden. The mouth of this bay is protected by Coney Island (area 388 acres), which stretches across the entrance, and forms a natural breakwater, within which large vessels, which cannot get up to the town, lie at anchor. There is another much smaller island in the bay, called Oyster Island, on which are two lighthouses; and westward from Coney Island extends a reef, on the western extremity of which, the Black Rock, dry at low-water, a lighthouse has been built. There is another still smaller island, Maguin's Island, off the headland between this bay and that of Ballysadere. The southernmost of the three bays, Ballysadere or Ballysadare Bay, forms the æstuary of the Ballysadere river: it is shallow, except just in the channel of the river, by which ships of 100 tons burden can get up to the village of Ballysadere. There are extensive sands or other strands in Killala and Sligo bays, and along the coast eastward of Sligo Bay. A narrow channel in the strand between Sligo Bay and Clossibawn, the mouth of a small rivulet, runs for several miles nearly parallel to the coast, and is known as Milk Haven. Two small islands lie between it and the sea.

Surface and Geology.—The mountains of this county form three principal groups. The Ox Mountains extend from the river Moy at Foxford, in the county of Mayo, north-east to the shore of Ballysadere Bay. The mountains which overspread the counties of Fermanagh and Leitrim extend into this county and occupy the north-eastern border: these form the second group. The third group consists of such portions of the Braughlieve and Curlew Mountains [ROSCOMMON] and the mountains round Lake Gara as are in the county. The Ox Mountains (to which, in the Map of Ireland, published by the Useful Knowledge Society, the name of Slievh Gauff is also given) form a considerable range, about twenty-five miles long and five or six in breadth. They consist chiefly of mica slate, with occasionally granite, hornblende slate, gneiss, and quartz rock; the strata dip rapidly towards the south. The summits have a mean height of 1300 feet above the level of the sea at low-water; on the north-west side they present abrupt rocky peaks, with intervening ravines of no great depth. On the south-east the ascent is more gradual and less rocky. Knock-a-Chree, the highest of the peaks, near the north-eastern termination of the range, is 1778 feet high; it is composed of hornblende slate. Streams are more abundant on the south-eastern slope than on the north-western; and amid the group are two small lakes, Lough Easkey and Lough Talt, the former 607 feet and the latter 455 feet above the level of the sea at low-water. The mica slate, of which the Ox Mountains are composed, extends eastward across the Ballysadere river, and along the south side of Lough Gill into the county of Leitrim, forming a range of hills which may be regarded as a prolongation of the Ox Mountains. At the base of the Ox Mountains the old red-sandstone and conglomerate are observed skirting on both sides of the range the primary rocks, and sinking below the carboniferous limestone, which occupies the lower lands extending on one side to the sea and on the other to the Curlew and other mountains on the border of Roscommon. The strata are generally very distinct; in some places however the conglomerate graduates insensibly into the subjacent quartz rock, especially on the south-east side of the range, where the two formations lie conformably on the inferior beds; but on the north-western slope the conglomerate rests on the outcrop or edge of the older beds. Garnets are found near Lough Easkey in the Ox Mountains.

Of the mountains on the border of Roscommon, the Braughlieve Mountains, which rise in one part 1346 feet above the level of the sea at low-water, belong to the carboniferous group, and the Curlew Mountains, which rise in one part 1062 feet above the level of the sea, to the old red-sandstone group.

The same group (the sandstone) occupies the headland on the north-western side of the entrance of Sligo Bay. The rest of the county is occupied by the formations of the carboniferous limestone group. A ridge of mountains west of Lough Gara consists of the yellow sandstone which constitutes the lowest member of this group; but very little of this ridge, if any part of it, is within the county. The lower limestone, the member next above the yellow sandstone, is found at the base of the Curlew Mountains near Lough Arrow, and yields grey and dove-coloured marble. The mountains on the north-eastern border of the county are formed of the calp and shale division, which is next above the lower limestone, and of the upper limestone, which is the uppermost division of the group. These mountains form part of the mountain district of Fermanagh, Cavan, Leitrim, Roscommon, and Sligo, the limestone of which bears a striking resemblance in character and composition to the mountain limestone of Derbyshire, Cumberland, and the north-west of Yorkshire, and which exhibits in perfection the whole series of formations belonging to the carboniferous limestone and the millstone-grit series of Ireland. In Benbulben, one of the loftiest mountains of the group (1722 feet above the level of the sea), situated several miles north of Sligo, the upper limestone is 900 feet thick. Its upper strata are frequently associated with irregular beds of semi-crystalline brown-spar rock, the disintegrated surfaces of which so much resemble ordinary grey sandstone in appearance that this rock has frequently been mistaken for it. Brown spar of this kind occurs on the summit of the mountain Knocknarea, or Knock-narea (1057 feet high), which occupies part of the headland that separates Sligo Bay from Ballysadare Bay. The northern face of the mountain Benbulben is nearly perpendicular, while on the south side a more gradual slope leads to the summit, which is a table-land of some extent. The other principal mountains of the north-eastern and eastern group are Truck More (2113 feet high), Truck Beg, Ben Weskin, King's Mountain (1965 ft.), Castlegal (1417 ft.), and Cullogue Boy (1430 ft.).

This county and the adjacent one of Mayo are traversed by trap dykes unexampled for length, directness, and parallelism. Their direction is nearly east and west. Trachyte, a formation not observed elsewhere in the British Isles, is found on the shore of Killala Bay. (Archdeacon Verschoyle, *On the North Coast of Mayo and Sligo*, in *Geol. Transactions, second series*, vol. v., pp. 149, &c.; Griffiths, *On the Geology of Ireland*, in *Appendix to Second Report of Irish Railway Commissioners*. The heights are from the *Ordnance Survey*.)

Copper and lead mines were formerly wrought in the primary district in which the Ox Mountains belong; but there are not any carried on at present. Garnets abound near Lough Easkey, and asbestos is found to the eastward. The Arigna coal-works are just beyond the boundary of this county. A considerable part of the district extending northward from the foot of the Ox Mountains to the sea is covered with bog; and there is a considerable extent of bog in the southern part of the county, but very little in the part which lies north of the town of Sligo.

Hydrography and Communications.—The western side of the county is watered by the Moy and other smaller streams which flow into Killala Bay, or into the open sea. A stream, called by some authorities the Moy, but in the Society's map the Owengarrow, has part of its course in this county and part in Mayo. It joins what is marked in the Society's map as the Moy, above Foxford. The united stream touches the western border of the county just below the town of Ballina, and forms the boundary of the county of Sligo and Mayo, until it falls into Killala Bay. It is navigable for vessels of considerable burden up to Ballina. Nearly all the rest of the county is drained by the streams which flow into Sligo Bay, of which the most important are the Ballysadare, and the river Sligo or Garvogue, which, flowing from Lough Gill, passes the town of Sligo. The Ballysadare is formed by two streams, the Owenmore and the Arrow or Unshin or Avnaduan (the latter flowing from Lough Arrow), which unite near the town of Collooney, and, falling over a ledge of rock which crosses the bed, enter Ballysadare Bay. These rivers are all small, and of little use for navigation.

The lakes are tolerably numerous, and have an aggregate area of 28 square miles. The principal are—Lough Gara, on the southern boundary, 232 feet above the level of the sea at low-water, and having an area in this county of 3384 acres, or above 5¼ square miles; Lough Arrow, in the south-eastern corner, 184 feet above the level of the sea, area in this county 2917 acres, or 4½ square miles; and Lough Gill, on the eastern boundary, 20 feet above the level of the sea, and having an area of 3131 acres, or nearly 5 square miles, in this county, beside a portion in the county of Leitrim. Among the smaller lakes are Lough Talt, or Tait, 432 feet above the sea, and Lough Easkey, 607 feet above the sea, area 168 acres, in the Ox Mountains; and Lough Car, or Glencar, 97 feet above the sea, having an area of 113 acres in this county, and a still larger area in the county of Leitrim, on the north-eastern border. Lough Gill is nearly six miles long from east by north to west by south, and about two miles wide. It is studded with islands, some of them richly wooded, and two of them, Church island (42 acres) and Cottage island (14 acres), inhabited. Lough Arrow, and Lough Gara, nearly as large as Lough Gill, but of more irregular outline, are also picturesque and studded with islands. Lough Arrow affords fine fishing in the spring; Lough Talt, imbedded amid precipices, abounds with trout, and is much frequented in the summer by water-fowl.

The principal roads are the mail-road from Dublin to Sligo, with a branch mail-road to Ballina and Castlebar; and the mail-road from Sligo to Ballyshannon (county of Donegal), from which place it continues to Donegal, Lifford, Strabane, and Londonderry, with a branch road to Enniskillen. The inland traffic to and from Sligo is very considerable, greater than to and from any other town in Ireland, except these six: Dublin, Cork, Belfast, Limerick, Galway, and Waterford. There are a mail-coach daily and another coach three times a week from Dublin to Sligo; a mail-coach daily from Sligo to Castlebar, and one from Sligo to Londonderry; a mail-car daily from Sligo to Enniskillen, and cars from the same town six times a week to Ballyshannon, and twice a week to Ballinacarrow, about nine Irish (between eleven and twelve English) miles south of Sligo. (*Appendix to Second Report of Irish Railroad Commissioners.*) The Ox Mountains are traversed by several passes; that through which the Dublin and Sligo mail-road runs presents some very picturesque scenery. The roads on the eastern side of the county are numerous, and those leading to the market-towns are, generally speaking, well laid out and well kept. Much has been done of late years, partly at the cost of the landlords, but in some places much remains to be done. There is scarcely any inland water-carriage, but in the parts about Sligo Bay produce is carried to market by water.

Soil; State of Agriculture; Condition of the People.—A considerable part of the soil, 168,711 acres, is occupied by unimproved bog or mountain; 257,217 acres are under cultivation. In the north the soil is thin and poor, but it improves as we advance southward. The vicinity of Sligo is a plain of great fertility: in the west the soil is light and gravelly, with large tracts of bog. The following particulars, extracted from the *Appendix to the First Report of the Commissioners for inquiring into the State of the Poor in Ireland*, apply to the barony of Carbury, which includes the town and neighbourhood of Sligo, and all that part of the county which lies north of that town, but may probably be taken as applying to most other parts of it.

About one half of the barony is held under resident landlords, the greater part of the remainder under landlords who have agents resident in the barony. About one-half of the land is held under middlemen, but as their leases expire, the landlords are putting down the system. The generality of farms are held under leases; these never exceed 21 years, and the general tendency is to shorten the term. One extensive landowner grants no leases, or scarcely any. The consolidation of small holdings has been actively going on for some years, but the farms are still very small. On the large estate of Sir R. G. Booth there were no farms over 30 acres, not six over 20, and the majority between 5 and 10. In the parish of Drumcliffe, the tithes are levied on holdings which average 3¼ acres each; and the holding on the average of the barony is estimated at from 3 to 5 acres: some few have 30, 40, or 50 acres of tillage, and grazing-farms average 80 acres. Want of capital, combined with want of skill and the quantity of ground lost by the numerous and irregular fences, keep down the productiveness of the farms. The people know nothing of artificial manure, and many think of nothing but sea-weed; but the consolidation of farms, and the engagement by some landlords of Scotch agriculturists to instruct their tenantry, will tend to improve the present wretched methods of farming. It is difficult, from want of capital, to find persons to occupy large farms, where an attempt is made to form them. Considerable emigration has taken place of late years, especially to the United States: the emigrants have been chiefly persons possessed of a little money, and a considerable number of them have been Protestants. The competition to obtain land is great, consequently rents are so high as to leave the occupier nothing but a bare subsistence. Yet the destitution of a large part of the population has not been any check to improvident marriages, and the distress prevalent among the people has led to occasional outrages, and created a sense of insecurity which has kept capitalists from taking farms when offered them. The 'con-acre' system is very prevalent; but from the superabundant population, many of the labourers occupy less than a rood of land, and some can obtain none.

The usual course of tillage is potatoes followed by two white crops, then potatoes again, after which a few of the larger farmers allow the land to remain fallow; but among the smaller farmers the course is an alternate crop of potatoes and grain. It is only by the help of sea-weed used as manure, which is often carried 20 miles, that the land is enabled to bear this constant exhausting process. Near Sligo, lime and animal manure are used as well as sea-weed. After gathering the potato crop, the land is manured with sea-weed; and in the spring it is ploughed, and the oats, wheat, or barley sown. Very little wheat is sown in November, as, if the season afterwards should prove wet, it does not succeed; besides it is difficult to get the potatoes off the ground in time. 'Some attention is paid to weeding the corn crops during their growth, but the farmers are not aware of the benefit of rolling the land, and there are consequently but few rollers in the barony; they generally defer cutting the corn till it has become dead ripe, by which delay it becomes thick-skinned, and the sample is greatly deteriorated in appearance and in the produce of flour.' But this delay is often the result of the farmer being obliged to do duty-work, or of other causes arising from his poverty. The same cause obliges him to bring his corn early to market, and thus the market at Sligo (from which port large quantities are shipped both to London and Liverpool) is glutted.

Clover and vetches, turnips, and mangel-wurzel may be seen on the demesnes of the proprietors, and some few patches on the lands of the tenantry, among whom the landlords are striving to introduce them. Few of the farmers require any further help than that of their own families, except in the hurried times of spring and harvest, when it is procured either by an exchange of labour or by hiring the smaller occupiers; when more constant help is required, one or two lads are kept. The grazing farmers are generally men of more capital than the tillage farmers, but the pasture-land is commonly poor. The labourers are placed on the worst land in the farm, from which their con-acre is taken. The number of cows kept varies from one to ten. The butter produced in the district is counted only second or third rate at the Sligo market, which itself ranks in London next below those of Cork and Belfast in the quality of its butter. The quantity of butter sold in Sligo market in 1833 was 53,452 firkins, weighing on the average 2 qrs. 15 lbs., of which 4 lbs. 'tret' is allowed; in 1834 the quantity sold was 48,525 firkins. Not many sheep are kept, except by large farmers, and a few by those who hold mountain farms: no improvement has been made in the breeds kept by the farmers, but there has been an improvement in those kept by gentlemen. The large Irish breed, and the mountain breed, which is smaller, are the most common. The farmers keep the Irish cattle; the proprietors and those persons who live near the town of Sligo, the Ayrshire, or a cross between the Ayrshire and the Irish; the latter are coming more and more into use for the dairy. Few cattle are fattened. The houses both of the dairy and tillage farmers are generally very poor, usually consisting of two or at most three rooms, a kitchen and two bed-rooms, one of which serves also for a dairy. The fences are usually dry stone walls or earthen banks. Draining is little attended to.

The average rent of tillage-land and pasture-land together appears to be from 1*l.* 5*s.* to 1*l.* 10*s.*, rising in some places to 2*l.*, and in others falling to 1*l.* Pasturage alone may be considered to average about 15*s.* The rent of con-acre ground varies from 4*l.* to 10*l.* per acre.

Employment is scarce and precarious, and the demand for labour has of late years much diminished, through the decay or removal of the linen-manufacture, the increase of population, and the subdivision of land. Wages have been decreasing; the farmers pay 5*d.* or 6*d.* a day in summer, and 4*d.* in winter, with diet. Gentlemen give 10*d.* a day in summer, and 8*d.* in winter, without diet. Young men boarded in the house receive 4*l.* or 5*l.* a year. Few men earn more than 6*l.* or 7*l.* a year; and of that less than 4*l.* in money, the rest being rent, &c. received in return for labour. It is the con-acre that maintains them. From the miserable insufficiency of their wages to procure proper sustenance, they are unable to do a full day's work. Early and inconsiderate marriages are exceedingly common; labouring men generally marry under twenty, and it is rare to find an unmarried person, of either sex, above thirty years of age. The labouring class, or cottiers, generally rent a cabin with or without a few perches of land: the rent is frequently paid in labour, so many days in the week. A few of them manage to keep a cow; for grass for which, during the summer half-year, they pay 1*l.* 10*s.* or 2*l.* Women can rarely get any out-of-door labour; a few are employed in harvest or hay-making time, and earn 3*d.* or 4*d.* a day. The earnings obtained by flax-spinning are very trifling, not more than a halfpenny a day. Children get no employment except from their parents. Few of the cottiers keep poultry; and only those who hold above half a rood of land have a sufficiency of refuse potatoes to enable them profitably to keep a pig. Herds are sometimes paid in money, sometimes by giving them a cabin and a small plot of grazing-land, with or without a small sum of money.

The cabins of the peasantry are of the most wretched description, built of sods or of loose stones, coated outside with a mixture of clay and mortar, with a clay floor, and a roof formed by laying branches of trees across the rafters, and covering them with sods of turf, over which is laid a thin and inadequate thatching of straw. The greater part are without chimneys, and are not large enough to be divided into apartments: a small pane of glass, kept in its place by mortar or mud, is the usual window; most have a wooden door on hinges, but others have wicker doors, and in a few the doorway is closed by a hanging of straw mats. Most have pigstyes or cowhouses, however wretched; but privies are not thought necessary, even for new houses built for farmers holding 12 or 13 acres of land. The rent of a cabin with a rood of land varies, according to the quality of the soil, from 1*l.* to 2*l.*, or even more. Turf is the ordinary fuel, and constitutes a serious item in the expenditure of a poor family, when they have not liberty to cut it on the estate.

A large portion of the labouring classes never get any food but potatoes with a little salt, and at prosperous seasons milk: those who live near the sea-shore get less milk, but occasionally they have fish. They get commonly three meals a day, but in scarce times only two. Considerable distress prevails yearly between the decay of the old potato-crop and the coming-in of the new, an interval varying from two to eight weeks. The clothing of the peasantry is very miserable, especially of the women and children; the last are at all times in rags. Many cabins have rude bedsteads, but frequently with no other bedding than straw or hay, with a single quilt or sheet of sacking, or perhaps a blanket for the parents and one or two of the younger children; the other children have often nothing but a little old hay. A table, a few stools, and a chest, perhaps with a metal pot and a pair of tongs, compose in the majority of cases the rest of the furniture. Drinking and illicit distilling have much diminished; though in some parts of the county they are still carried on to a considerable extent.

Division, Towns, &c.—The town is divided into six baronies, as follow:—

Barony.	Situation.	Area in Acres. Land.	Water.	Total.	Population in 1831
Carbery or Carbury	N. and N. E.	76,279	2,605	78,884	48,[illegible]
Coolavin	S.	25,449	3,708	29,157	8,39[illegible]
Corran	Central	44,988	640	45,628	17,431
Leyny or Leney	Central and S.W.	120,624	1,062	121,686	32,849
Tirraghrill or Tireirill	E.	75,199	4,397	79,596	28,73[illegible]
Tireragh or Tyreragh	W.	106,474	328	106,802	33,[illegible]56
Total area		449,013	12,740	461,753	171,7[illegible]

Boroughs: the county town of Sligo; the market and post towns of Collooney and Ballymote; the market towns of Coolaney, Tobbercurry, and Easky; and the post town of Dromore West. The principal villages are Ballysadere, Achonry, Grange, and Riverstown.

Sligo, the county-town, is situated on the Garrogue or Garvoge river, which flows from Lough Gill into Sligo Bay, one half a mile above its mouth. It is in the barony of Carbury. This town appears to have owed its importance to a castle and monastery of Dominican friars, built here A.D. 1242 and 1252, by Maurice Fitzgerald, earl of Kildare, and at that time lord justice of Ireland. The town suffered repeated injuries from the hostilities between the English and the native Irish, and from fire. In the reign of James I. it received a grant of a market and two fairs, and was incorporated and made a parliamentary borough. In the civil war of Charles I. the town was occupied by the parliamentarians under Sir Charles Coote (A.D. 1645). They were however attacked by a strong force under the Roman Catholic archbishop of Tuam, but repulsed the assailants. The archbishop was killed in the retreat; and his papers, which were taken, afforded evidence of the king's private treaty (concluded on his behalf by the earl of Glamorgan) with the Catholics. Sir Charles Coote afterwards abandoned the town, which was occupied by the Catholics, and retained by them to the end of the war. In the civil war of James II. it was taken by the Enniskilleners, who, after repelling one attack, were driven out by the Jacobites under Sarsfield; it was again occupied by the Protestants under lord Granard.

The river Garvogue makes a bend just at the town, its course changing from west to north and north-west. Part of the town is situated within the elbow thus formed, but the greater part is on the other side (the south and west side) of the stream. The town extends, in all, about a mile from north to south, and nearly as far from east to west. The streets are irregularly laid out; they are paved, but the pavement is in many parts very indifferent, and they are not lighted. The houses are generally respectable, and some of them very superior. There are two bridges; the old bridge below the bend, and the new bridge above it. The left bank of the river, below the old bridge, is lined with quays; these quays have been extended and some warehouses built within the last few years. That part of the town which is on the south and west side of the river is in the parish of St. John; the church is on the south-west side of the town, near the outskirts: it is an antient cross church, with a massive square tower at the west end. The other part of the town is in Calry parish; the church is at the eastern end of the town: it is a modern building, in the Gothic style, with a well-proportioned spire. There are in the town a Catholic chapel (for St. John's parish), and a small Dominican convent, with a chapel attached to it; and meeting-houses for Methodists (two), Presbyterians, and Independents. Just out of the town, on the east side, are the fever hospital, infirmary, and dispensary, all in one enclosure, and a charter-school; these are near Calry church, north of the river: on the opposite bank is the county gaol. The custom-house is on the new quay, just below the town, and not far from it are the police barracks and the government emigration-office. The town has every prospect of extension and improvement.

The population of the borough, in 1831, was 15,152; viz. 11,411 in St. John's, and 3741 in Calry: the outparts of the two parishes contain a considerable population in addition to the above, viz. St. John's, 9610, and Calry, 2379. There are a few linen and stocking weavers; but the linen manufacture, once very flourishing, is almost extinct, and the linen-hall is unoccupied. There is a large whiskey-distillery on the south bank of the river, above the new bridge, several breweries, with flour-mills, soap-houses, rope-walks, and manufactures of tobacco and snuff, hats, and candles. The trade of the port is very considerable. The exports are chiefly of corn, meal, flour, butter, provisions, and linen yarn; and the imports, West India produce, tobacco, refined sugar, tea, British spirits, wine, flax-seed, tallow, glass and earthenware, coals, iron, timber, and salt. The principal markets for corn and provisions are on Tuesdays and Saturdays, and are well attended: there is a corn and butter market every day; there are five yearly cattle fairs, and a considerable salmon fishery is carried on in the river just above the town. The estimated value of the exports in 1835 was 339,490*l.*; of the imports, 124,692*l.* The amount of customs duty collected at the port in 1832 was 33,094*l.* 12*s.* 7*d.* gross, or 17,123*l.* 12*s.* 5*d.* net, after deducting repayment of trade vouchers, office expenses, and incidental charges; in 1839 the gross amount was 25,450*l.* 2*s.* 8*d.*; the net revenue, 13,748*l.* 11*s.* 5*d.*

The corporation, before the late Irish Municipal Reform Act, consisted of a provost, twelve free burgesses, and commonalty; under that act the borough has been divided into three wards, and has a mayor, six aldermen, and eighteen councillors; the commonalty are now termed the burgesses. The borough has a court of quarter-sessions, which is also a court of record. The municipal borough, as limited by the same act, is much smaller than the parliamentary (and previous municipal) borough, which is bounded by a circular line drawn with a radius of one mile Irish, and having the market-cross as a centre. Sligo returns one member to parliament: before the Union it sent two to the Irish Parliament. The assizes for the county, quarter-sessions for the division, and petty-sessions for the district, are held here. St. John's parish (a rectory) and Calry parish (a vicarage) are included, with the adjacent parishes of Killaspicbrone (rectory and vicarage) and Kilmacowen (rectory and vicarage), in the union of St. John's, Sligo; the gross revenue of which was returned (on the average of three years, ending with 1831) at 842*l.* 13*s.* 9*d.*, the net revenue at 719*l.* 6*s.* 4*d.* There are some ruins of the antient monastery, including three sides of the cloisters, and a portion of the church, the east window of which is of beautiful design and adorned with rich tracery.

Collooney is in that part of the parish of Ballysadere which is in the barony of Tirraghrill or Tyrerill, about seven miles south of Sligo, through Ballysadere. It is a small place, on the right or east bank of the Awinmore (or Owenmore, as it is often written), and consisted, in 1831, of a single street of 90 houses (89 inhabited and one empty), of which about 13 were slated, the rest thatched. The street runs northward to the Awinmore, over which there is a bridge. The population in 1831 was 653. At the southern end of the town are the church, a handsome Gothic building containing some good monuments, the police-barracks, and the market-house; and in other parts of the town a Roman Catholic chapel, a linen-hall, a dispensary, and two schools. Near the town are a large bleach-ground and an oatmeal-mill. The market is on Thursday, and there is one yearly fair. A short distance north-east of the town, at the junction of the Awinmore and Arrow, are the remains of an antient castle. There was a smart skirmish near Collooney (September 5, 1798), between a detachment of the Limerick militia, under Colonel Vereker, and the invading French force, under General Humbert.

Ballymote is in the parish of Emlyfadd or Emlaghfad, in the barony of Corran, about 14 miles south by west from Sligo, by Ballysadere and Collooney. It had formerly a strong castle, built by Richard de Burgo, A.D. 1300, seized by the native Irish in the great civil war of 1641, and retaken by the Parliamentarians, under Ireton and Sir C. Coote, in 1652. The ruins of this building occupy an area 150 feet square; and there are the remains of a Franciscan friary. The town had, in 1831, 140 houses, viz. 124 inhabited, and 16 empty, and a population of 875. It is at the junction of six considerable roads, and is irregularly built. The parish church of Emlyfadd, a good building, in the early English style, with a handsome tower and spire, is in the town; and there are a Catholic chapel, a Methodist meeting, police-barracks, a bridewell, and a court-house in which quarter-sessions for the division and petty sessions are held. The linen manufacture, formerly carried on to some extent, is now nearly extinct; there is a weekly market, and there are six yearly fairs.

Coolaney is in Killoran parish, in the barony of Leyny, about 10 miles south-west of Sligo, through Ballysadere. It stands on the right or south-east bank of the Awin, or Owenbeg, which joins the Awinmore about two miles above Collooney. There were, in 1831, 68 houses, viz. 58 inhabited, 8 uninhabited, and 2 building; the population was 425. The houses form one street, running nearly north and south, parallel to the river, over which, near the north end of the town, is a bridge. There are a dispensary, a court-house for petty sessions, a police barrack, and a small Baptist meeting-house. There is a weekly market, and there are two yearly fairs. There is a penny post, dependent on the post-office at Collooney.

Tobbercurry, or Tobercurry, is in the parish of Achonry and barony of Leney, about 21 miles south-south-west from Sligo, on the road to Swineford and Castlebar, and 10 or 11 miles from Ballymote. The town had, in 1831, 48 houses, viz. 40 inhabited, 6 uninhabited, and 2 building; the population was 210; there are in the place a neat Episcopal chapel, a Roman Catholic chapel, a police-barrack, and a market-house. The market is on Monday, and there are seven yearly fairs. There is a penny-post, dependent on Ballymote.

Easkey is in Easkey parish, in Tyreragh barony, 27 miles west of Sligo, on the old or coast road to Ballina. It is chiefly on the left bank of the river Easkey, about half a mile from its mouth: it is irregularly laid out, but most of the houses are on the Ballina road; there were, in 1831, 76 houses, viz. 61 inhabited, 14 uninhabited, and 1 building; the population was 289. The church is a neat building, and there are a Roman Catholic chapel and a Baptist meeting-house. There are the ruins of an old church, and in the neighbourhood are the remains of two antient castles, and some other antiquities. The market is on Wednesday, and there are two yearly fairs in the town, beside two others at Rosslee in the parish. Petty-sessions are held once a fortnight in a court-house in the town. Quarter-sessions for the division are also held here.

Dromore West is in the parish of Kilmacshalgan, in the barony of Tyreragh, about 22 or 23 miles west of Sligo, on the road through Ballysadere to Ballina. It stands on the little river Dunneill, which flows into the sea about a mile below the town, and consist of about 20 houses; it has a post-office: a short distance east of the village are the present parish church and the remains of the former one; and a short distance south-west is the Roman Catholic chapel.

Ballysadere is on the river of the same name, just above its outfal in Ballysadere Bay, five miles south of Sligo. It is in the parish of Ballysadere, and just on the boundary of the baronies of Tirraghrill and Leney, which are here separated from each other by the river. That part of the village which is on the right bank is in Terraghrill, the part on the left bank in Leney. The village consists of one main street on the right bank, running down to the bridge, and some houses, irregularly grouped, on the other bank; there were, in 1831, 100 houses, 95 inhabited and 5 empty; the population was 546. It a busy little place; on the river below the village are several mills, and in the immediate neighbourhood are a limestone-quarry and a bleach-green. Vessels of 100 tons can enter the river, and there is some export of corn and meal. There is a small pier, and at the mouth of the river a quay. There are seven yearly fairs, besides others at Tubberscanavin, Carricknagatt, and Collooney, all in this parish. At the mouth of the river on the left bank are the remains of an antient church, and near it the ruins of an abbey.

Ardnaree is in the parish of Kilmoremoy, in Tyreragh barony. It is on the right bank of the river Moy, and forms a suburb of the town of Ballina, which is on the opposite bank. It consists of one principal street running westward down to the bridge, which unites it with Ballina, and of some smaller streets or lanes leading from this; there were, in 1831, 512 houses, viz. 432 inhabited, 64 uninhabited, and 16 building: the population was 2482. The parish church is in the town, and the Roman Catholic chapel is very handsome; it is the cathedral of the Roman Catholic bishopric of Killala. There are the remains of an antient Augustinian abbey or monastery. There are a brewery in the town and a salmon-weir and a flour-mill just above it.

Grange is in the parish of Ahamlish and the barony of Carbury. It consisted, in 1831, of 40 houses, 34 inhabited, 4 uninhabited, and 2 building; the population was 221. It has a Catholic chapel, and near the village are a revenue police-barrack, and one for the county constabulary. There are seven yearly fairs.

Riverstown is partly in Drumcollum or Drumcolumb parish and partly in Kilmacallan, in the barony of Tirraghrill. It had, in 1831, 89 houses, viz. 87 inhabited and 2 building; the population was 421. The parish church of Kilmacallan is in the village, and the Catholic chapel; both are plain buildings: there are a Methodist meeting-house near the village and a police-barrack. There are two corn-mills and two kilns.

Divisions for Ecclesiastical and Legal Purposes.—The county was formed on the division of Connaught into counties by Sir Henry Sidney, lord-deputy of Ireland, under Queen Elizabeth, A.D. 1565. With the exception of two parishes, it is divided among the three dioceses of Elphin, Killala, and Achonry, the chief part belongs to the last. All the parishes of the barony of Carbery, except Rossinver, which is in the diocese of Kilmore and province of Armagh, and all those in the barony of Tirraghrill, except Ballysadere and Killery, the latter of which is in the diocese of Ardagh and province of Armagh, are in the diocese of Elphin; all those in the barony of Tyreragh, in the diocese of Killala; and all those in the baronies of Coolavin, Corran, and Leney, with the parish of Ballysadere, which is partly in Leney, partly in Tirraghrill, are in the diocese of Achonry. From the time of Charles I. the two sees of Killala and Achonry were united; and in 1833 they were, in pursuance of the act of 3 and 4 William IV., united to the see of Tuam. By the same act Elphin is, upon its next avoidance, to be added to Kilmore. All these are in the ecclesiastical province of Armagh. The Roman Catholic dioceses nearly coincide with those of the established church, but Killala and Achonry have continued separate. The Catholic bishop of the diocese of Killala has his seat at Ardnaree, a suburb of Ballina, in this county; and the bishop of the diocese of Elphin has his residence at Sligo. The county contains thirty-seven entire parishes and part of four or five others.

It is in the Connaught circuit: the assizes are held at Sligo, where is the county gaol. Quarter-sessions for their respective divisions are held at Sligo, Ballymote, and Easkey at each of the last two places there is a court-house, and at Ballymote there is a bridewell. The Report of the Inspectors of Prisons as to the general management of the county gaol and the Ballymote bridewell (*Parl. Papers*. 1840 is favourable; but the county gaol has no adequate provision for the adoption of the system of separate confinement. The number of persons committed for trial in 1837 was 154, of whom 107 were convicted, 1 found to be insane, and 46 acquitted: of the convictions, only one was for a capital offence. In 1839, 578 persons were committed, of whom 151 were convicted, 1 found to be insane, and 426 acquitted or discharged without trial: of the convictions, not one was for a capital offence. In both years the number of offenders was below the average of the Irish counties, and in the year 1837 very far below it.

It returns two members to parliament for the county, and one for the borough of Sligo. Before the Union, Sligo borough returned two members to the Irish parliament. The county members are elected at Sligo. The number of voters for the county in 1834-5 was 804; for the borough of Sligo 694.

The county constabulary consisted, on the 1st Jan., 1840, of one county inspector, third-rate; five sub-inspectors, one first-rate and the other four third-rate; six head constables, one first-rate and five second-rate; twenty-three constables, and one hundred and forty-nine sub-constables, of whom one hundred and nineteen were first-rate and thirty second-rate: the whole expenditure for this force in the year ending 31st Dec., 1839, was 9598*l*. 18*s*. 3½*d*. The total amount of grand-jury presentments for the same year was 20,825*l*. 18*s*. 5½*d*., consisting of the following items:—New roads, bridges, pipes, gullets, &c., 879*l*. 18*s*. 7*d*.; repairs of roads, bridges, pipes, gullets, &c., 6092*l*. 7*s*. 7½*d*.; erection or repair of court or sessions houses, 110*l*. 15*s*. 6*d*.; building or repairing gaols, bridewells, and houses of correction, 127*l*. 5*s*. 3*d*.; [illegible] other prison and bridewell expenses, 2943*l*. 3*s*. 4*d*.; po[illegible] and police establishments, 4020*l*. 8*s*. 8½*d*.; salaries of [illegible] county officers, not included above, 2374*l*. 12*s*. 11*d*.; public charities, 3145*l*. 11*s*. 8*d*.; repayment of advances to government, 417*l*. 14*s*. 0*d*.; miscellaneous, not included above, 1413*l*. 1*s*. 3½*d*.; together, 21,524*l*. 18*s*. 10*d*.; from which the sum of 699*l*. 0*s*. 4½*d*. is to be deducted for re-presentments. The county is included in the district of the Connaught lunatic asylum at Ballinasloe, in which it had, in the year ending 31st Dec., 1839, 39 patients, at a charge of 623*l*. 4*s*. 0½*d*. The county infirmary and fever hospital are at Sligo; and there are dispensaries at Ballymote, Carney, Castleconnor and Kilglass, Collooney, Coolaney, Dromore West, Riverstown, Tubbercurry, and St. John's, Sligo.

The number of schools in connection with the National Board on the 31st March, 1835, was 18, with 18 teachers, namely, 13 males and 5 females; and 2663 children, namely, 1571 boys and 1092 girls, on the roll.

History and Antiquities.—In the most antient historical period, this part of Ireland is thought to have been inhabited by the people called by Ptolemy Ναγνάται, Μαγνάται, or Μαγνᾶτοι, Nagnatae, or Magnatae, or Magnati; whose chief town, Νάγνατα, Nagnata, or Μάγνατα, Magnata, called by Ptolemy πόλις ἐπίσημος, 'an eminent city,' is supposed by Sir James Ware to have been near Sligo, though Baxter places it at or near Galway. The Λίβνιος or Λίβοιος ποταμὸς, river Libnius or Liboeus of Ptolemy, is supposed to be the river on which Sligo stands; but the correctness of this opinion depends in a great degree on the identity of Nagnata with the town of Sligo. In the territorial arrangement of Ireland which prevailed both before and for long after the establishment of the English dominion in the island, this part of the country was divided as follows·—

Antient Division.	Modern Division.
Calruidhe, or, more usually, *Calrigia*, apparently the modern parish of Calry, near Lough Gill.	Nearly coinciding with the barony of Carbury.
Dartrigia, also near Lough Gill.	
Kinel Cairbré, whence the modern name of the barony.	
Siol Morey, the neighbourhood of Sligo, more antiently called Crioch Carbury: it was the country of O'Connor Sligo.	
Coranna, whence the modern Corran.	Nearly coinciding with the baronies of Corran and Leney.
Luigne (whence the modern Leney), a subdivision of Coranna.	Nearly coinciding with the barony of Leney
Gregraria, in the neighbourhood of Lough Gara, the name of which appears to be an element of the designation Gre-grar-ia.	Nearly coinciding with the barony of Coolavin.

This part of Connaught was made the scene of warfare between the descendants and family of Roderic O'Connor (the last monarch of Ireland), in their struggle for the principality of Connaught. Hugh O'Nial, chieftain of Tir-owen, or Tyrone, was defeated near Ballysadere (A.D. 1200) in the attempt to reinstate Cathal Croobhderg, or Cathal of the Bloody Hand, who had been dethroned by his brother or kinsman Carrach, who was supported by the Anglo-Normans under De Burgh or De Burgo. Some of the Anglo-Norman settlers were engaged on the side of Cathal. In 1245 the castle of Sligo was built, and, having been destroyed by the natives, was restored about the beginning of the next century.

The relics of antiquity are numerous. There are many cromlechs and other (supposed) Druidical monuments; and several remarkable caverns, the origin and purpose of which are unknown. Raths, or hill forts, are numerous in all parts of the county; and at Drumcliffe is one of the 'round towers' which have excited so much discussion: it is distinguished by its small dimensions and coarse construction. The ecclesiastical and castellated ruins of a somewhat later date are also numerous: several of the monastic churches have been converted to parochial use.

In the general rebellion near the close of Elizabeth's reign, the royal forces under Sir Conyers Clifford, president of Connaught, were surprised in this county by the natives under O'Ruarc, or O'Rourke, chieftain of Breffney (now Leitrim), and suffered considerable loss. In the rebellion of 1641 the county was occupied by the insurgents, and though Sligo was taken from them (A.D. 1645), and they were repulsed in an attack upon it by Sir C. Coote, they recovered it afterwards, and held it till nearly the close of the war. In the war of the Revolution the county was held by the Jacobites. A body of them were indeed repulsed on their first advance toward Sligo town by the Protestants of Enniskillen; but on their advance with a superior force, they obtained possession of that town. In the French invasion of 1798, a smart skirmish was fought at Colooney between the invading force, under General Humbert, and a body of the Limerick militia, under Col. Vereker.

(*Ordnance Survey of Sligo;* Lewis's *Topographical Dictionary of Ireland; The History and Antiquities of Ireland*, by Sir James Ware, translated and augmented by Harris; Moore's *History of Ireland;* Gordon's *History of Ireland;· Parliamentary Papers.*)

SLING, an instrument with which stones or other missiles may be thrown to a great distance. In its simplest form the sling consists of a thong of leather, or a piece of cord or some woven fabric, both ends of which are held in the hand of the slinger. The stone or missile is placed in the fold or double of the thong, which is made wide at that part, and sometimes furnished with a slit or socket for the purpose of holding it; and the sling is then whirled round to gain an impetus. When a sufficient degree of centrifugal force is thus generated, the slinger allows one end of the thong to escape, and the stone, being thereby released, flies off with considerable velocity. In the hands of an expert slinger, this instrument may be made to project missiles to a great distance, and with surprising accuracy.

The simplicity and portability of the sling, and the facility with which supplies of ammunition for it might be obtained, led to its extensive use among the antients as a weapon of war, as well as for other purposes. Its common use among the Jews is intimated by several passages of Scripture. In the book of *Judges*, xx. 16, we read of 700 men of the tribe of Benjamin, of whom it is stated that 'every one could sling stones at an hair-breadth, and not miss.' At a later period the account of David's conflict with Goliath indicates his familiarity with this weapon; while the subsequent notices in 1 *Chron.*, xii., and 2 *Chron.*, xxvi., distinctly allude to its use as a weapon of offence. Several antient paintings represent the use of the sling at an early period by the Egyptians. Some of these are given by Wilkinson, who says (vol. i., p. 316, &c.),—'The sling was a thong of leather, or string plaited, broad in the middle, and having a loop at one end, by which it was fixed upon and firmly held with the hand; the other extremity terminating in a lash, which escaped from the fingers as the stone was thrown; and when used, the slinger whirled it two or three times over his head, to steady it and to increase the impetus.' In the Greek and Roman armies the light troops consisted in great part of slingers, who were called σφενδονῆται, or *funditores*, from σφενδόνη, and *funda*, the Greek and Latin names of the weapon. The Carduchi, according to Xenophon, annoyed the retreating army of the Ten Thousand by their powerful slings. (*Anab.*, iv. 1, &c.) There are no slingers mentioned in Homer; and the word which usually means sling (σφενδόνη) occurs only once (*Iliad*, book xiii., line 599), and then not in the sense of sling, but in the primary sense of the word, which means a broad band or bandage. This passage has sometimes been strangely misunderstood. The sling is not mentioned by Herodotus; and it is an error to assign the use of it to the Persians, for which there appears no evidence but a loose expression in Diodorus (xviii. 51), where he speaks of 'Persians, bowmen and slingers, five hundred.' The natives of the Balearic Islands attained the highest reputation for their skill in its management; which is attributed to their custom of teaching their children, while very young, to wield it, and forbidding them, it is said, to taste their food until they had dislodged it from a post or beam by means of a sling. Among the Greeks the sling was used with the greatest expertness by the Achæans and Acarnanians. Besides stones, leaden plummets, cast in moulds, were used as projectiles for the sling. These, which were called *glandes*, or μολυβδίδες, were of an elongated spheroidal form; somewhat resembling that of olives or acorns. They have been often discovered in various parts of Greece, and frequently bear on one side a figure of a thunderbolt, and on the other side either the word ΔΕΞΑΙ (take this), the name of their owner, or some other inscription or device. Some of these were of considerable size, weighing as much as an Attic pound, or 100 drachmæ. Fireballs also have been thrown by slings. Antient Egyptian representations show a small bag, attached to a belt worn over the shoulder of the slinger, for the purpose of holding a supply of stones; and a Roman bas-relief represents a slinger with a supply of stones laid in the folds of his *pallium*, or upper garment, hanging, like the Egyptian bag, upon his breast. Some of the slings used by the antients were managed by more than one cord; one, two, or three being used, according to the size of the missiles to be thrown.

The sling was long used, both as an offensive weapon and otherwise, in England. Strutt observes, 'that it is altogether uncertain whether the antient inhabitants of Britain were acquainted with the use of the sling or not;' but that our Saxon ancestors certainly used it, and seem to have been skilful in its management. Besides the ordinary sling, they used one attached to a staff or truncheon three or four feet long, wielded with both hands. This kind of sling, with which large stones were thrown, appears to have been used principally in sieges and in naval warfare. It is represented in an old drawing, supposed to be by Matthew Paris. Slingers formed a part also of the Anglo-Norman soldiery; and the following lines, quoted by Strutt, show that the sling had not fallen into disuse as a military weapon at the commencement of the fifteenth century. They occur in a MS. poem of that date, entitled 'Knyghthode and Batayle,' which professes to treat upon the duties and exercises necessary for a good soldier. The object of the poet in this passage is to express the destructive effect of stones projected from a sling, even to men cased in armour; and the advantages of the weapon, in being readily carried, and easily supplied with ammunition in any place:

> 'Use eek the cast of stone, with slynge or honde:
> It falleth ofte, yf other shot there none is,
> Men harneysed in steel may not withstonde
> The multitude and mighty cast of stonys:
> And stonys in effecte are every where,
> And slynges are not noyous for to beare.'

In alluding to the more recent use of slings for amusement, Strutt mentions a substitute for the ordinary sling, consisting of a stick of ash or hazel, cleft at one end to receive the stone; which was thus held with sufficient force to keep it from falling out, yet not so firmly as to resist the impulse of the slinger. It required, he states, much practice to make the stone fly out at exactly the right time, so as to strike the mark with precision. The use of the sling may now be considered obsolete in this country, not only as an offensive weapon, but even as a means of amusement.

SLINGELANDT, PETER VAN, was born at Leyden in 1640, and became a pupil of Gerard Douw. He imitated very successfully the highly finished style of his master, whom in this respect he frequently equalled. His colouring is perfectly true to nature, and his chiar'oscuro admirable. Various instances are recorded of his extreme patience in finishing his works. It is related by Houbraken, that he was employed three years, without intermission, on a small picture containing portraits of the family of Meerman, and that he devoted a whole month to the finishing of a ruff. When he introduced a dog, a cat, or a mouse, which he often did, he seemed to have made a point of representing every single hair. It was to be regretted that with all this labour his design and composition are in general indifferent, and far inferior in correctness and expression to his master. His works are however highly valued, as among the best of the Flemish school, and are often mistaken for those of Mieris and Gerard Douw. Dr. Waagen, in his account of the galleries in England, mentions very few of this artist's performances: one in Sir Robert Peel's collection; one in the Bridgewater gallery, distinguished, he says, by the incredible minuteness of detail in the execution, in which it even exceeds Gerard Douw, though far inferior to him in other respects; two in the private collection of George IV., which he highly commends, and which have both been ascribed to G. Douw, and sold as his; and one in the collection of the Marquis of Bute, at Luton House, which he says is far more powerful and warm in the tone, and more spirited in the execution, than is usual with him. Slingelandt died in 1691, aged 51.

SLIP, or BUILDING-SLIP, a piece of ground cut in a direction perpendicular to the bank of a river or harbour, so as to form an inclined plane, descending from the general surface of the land at one end, towards the water at the other end. It is frequently paved with stone, and it is entirely covered by a roof, which is supported on lofty pillars of wood. On this plane ships are built, and therefore its length and breadth must exceed those of the largest vessel for which it is intended. Its slope has about 1 foot in height to every 19 feet in length, so that its surface is inclined to the horizon at an angle of about three degrees. Its lower extremity is considerably below the level of high water, and strong gates keep the slip dry till the vessel is about to be launched.

It has been stated in the article SHIP-BUILDING, that during the construction of a vessel, the keel rests upon blocks of wood placed at intervals in line on the slip. Now when the vessel is to be launched, timbers placed side by side, having their upper surfaces worked to a plane, or to a gentle curve with its convexity upwards, and made very smooth, are disposed on blocks which are also laid on the slip, in a line on each side of the keel, parallel to it, and at the distance of a few feet (usually about one-sixth of the vessel's breadth) from it. These two inclined planes are called the *ways;* each extends through the whole length of the slip, and its breadth is about three feet: its slope is rather greater than that of the slip, having 1 foot in height to about 14 feet in length, so that its inclination to the horizon is above 4 degrees. Previously to the ship being launched, a frame of timbers called a *cradle* is constructed for its support; and this, carrying the vessel with it, is allowed to slide upon the ways till the ship floats upon the water; then the cradle, whose parts are kept together and are attached to the ship only by treenails, either falls to pieces of itself or is removed by the workmen. Along the exterior side of each of the *ways* is a riband or ledge of timber raised above 4 inches above the surface, in order to prevent the frame-work which forms the cradle from being, by any lateral pressure, forced off from the plane.

The cradle is formed by laying upon each of the *ways* one long timber called a *bilge-way*, about 12 inches in breadth, and as much in depth, having its lower surface made quite smooth, and upon this another timber, which is capable of being raised a little from the former by means of numerous wedges placed between them at intervals in its whole length. Above these timbers, about the middle of the ship's length, are laid others longitudinally; and near the two extremities are placed stout props of timber in vertical positions, the upper sides of the former and the upper ends of the latter being in contact with the bottom of the hull. Previously to the completion of the cradle the surfaces of the two inclined planes or ways are covered with a thick coating of soap, tallow, and oil; and when, by driving in all the wedges simultaneously, the upper part of the cradle is made to press against the bottom of the ship, so that the weight of the latter is in a great measure taken off from the blocks under the keel, on cutting away those blocks the ship is ready to descend in its cradle to the water. In fact, the ship is then only prevented from sliding on the ways by two short timbers called the *dog-shoars*, which are placed, one on each of the ways, near the head of the vessel at a small angle of inclination to the plane of the ways. Each of these shoars is kept in its inclined position by a short prop called a *poppet* placed under its extremity (that which is nearest to the head of the vessel), and that extremity, which is covered with iron, abuts against a projection on one side of the cradle, while the lower extremity abuts on a *cleet*, which is spiked down to the surface of the way. When the ship is to be launched, the gates of the slip having been opened, and the water suffered to flow in by the rising of the tide, the poppets of the two dog-shoars are knocked away at the same moment, which is nearly that of the highest water; and should the shoars not drop down, on cutting a slender string at the ship's head a heavy mass of lead on each side becomes disengaged, and descending upon each shoar at the same instant, causes both of them to fall. Then the weight of the ship on the inclined planes, aided by a small elevation of her hull, produced by the water which has entered the slip, causes her to descend gradually into the river or harbour.

SLOANE, SIR HANS, Bart., was born at Killileagh in county Down, on the 16th of April, 1660. Though a native of Ireland, he was of Scotch extraction, his father Alexander Sloane having been the head of a colony of Scots whom James I. settled in Ulster.

While young his health was delicate, and from his sixteenth to his nineteenth year he suffered from spitting of blood. It was however in his youth, and while living at home, that he imbibed a taste for those pursuits in the cultivation of which he afterwards attained such celebrity. As soon as his health would permit, he repaired to London, and during four years which he spent in the metropolis devoted himself to the study of medicine and the collateral sciences. Strafforth, a pupil of the celebrated Stahl, was his instructor in chemistry, and his fondness for botany brought him acquainted with Ray and Robert Boyle. In 1683 he set out for Paris, and during his stay there attended the anatomical lectures of Duverney and those on botany by Tournefort. On his departure for Montpellier he was furnished by Tournefort with introductions to all the celebrated men at that university. Here he passed a year, spending much of his time in collecting plants, and, after having travelled through

Languedoc with the same purpose, returned to London late in the year 1684.

He gave many of the plants and seeds which he had collected to Ray, who described them, and acknowledged his obligations to the donor in his 'Historia Plantarum.' He now settled in London, and the young physician found in the great Sydenham a most valuable friend, who did all in his power to introduce him to practice. In 1685 he was elected a fellow of the Royal Society, and a fellow of the College of Physicians, in April, 1687. His attention had been excited when young by the descriptions of the wonderful productions of tropical climates, and the offer of the appointment of physician to the duke of Albemarle, who was going out as governor to Jamaica, afforded him an opportunity of gratifying his curiosity. He accordingly set sail with the duke on September 12, 1687, and after touching at many of the Caribbee islands, reached Port Royal on the 19th of December in the same year. The death of the duke soon after his arrival diminished Sloane's resources, and compelled him to hasten his return, though he did not leave Jamaica till he had formed in that and the neighbouring islands an immense collection of plants. He arrived in England on the 29th of May, 1689, after a residence in Jamaica of only fifteen months.

The plants which he brought with him amounted to 800 species. Of these he gave his friend Mr. Courten whatever he wanted to complete his collection, and the remainder, with other objects of natural history, formed the nucleus of his museum. Success soon attended him in practice. He was appointed physician to Christ's Hospital in 1694, and held the office for thirty years; and in 1695 he married a lady of considerable wealth, Elizabeth, daughter of Alderman Langley, by whom he had four children, two of whom died young, while two daughters survived their parents, and carried their wealth to the noble families of Stanley and Cadogan.

In 1693 he was chosen secretary to the Royal Society; and in 1712 was elected one of the vice-presidents. The Academy of Sciences in Paris had conferred on him the title of a foreign associate in 1708. George I. created him a baronet in 1716, and appointed him physician-general to the forces; he was elected president of the College of Physicians in 1719, and held the office till 1735. In 1727 he was appointed physician to the king; and in the same year had the honour of succeeding Newton in the president's chair of the Royal Society. He had purchased an estate at Chelsea in 1720, and retired thither in 1740, when eighty years old. His time was now passed in entertaining scientific men, and in examining the treasures he had collected. He died, after a short illness, on January 11, 1753, in the ninety-third year of his age.

Sir Hans Sloane was a man of a benevolent and generous disposition, and active in all schemes for doing good. During the thirty years that he held the appointment of physician to Christ's Hospital he never kept his salary, but always devoted it to charitable purposes. He was very active in establishing the Dispensary set on foot by the College of Physicians for providing the poor with medical attendance and medicines gratuitously, the opposition to which on the part of the apothecaries called forth Garth's talent for satire; but he was so ready to banish the memory of a quarrel, that when he purchased his Chelsea estate in 1722, he presented the Apothecaries' Company with the freehold of their botanic garden. He did all in his power to promote the formation of the colony in Georgia in 1732, and was one of the founders of the Foundling Hospital, and drew up the plans for the management of the children.

Sir Hans Sloane directed that at his death his museum should be offered to the nation for 20,000*l.*, a sum which he says, in a codicil to his will, dated July 20, 1749, did not amount to a fourth part of its real value. This collection, in the purchase of which by government the British Museum originated, was not altogether accumulated by Sir H. Sloane, but had been greatly increased by the bequest, in 1702, of the museum of his friend Mr. Courten. At the time of his death, Sir H. Sloane's cabinet contained 200 volumes of dried plants, and 30,000 other specimens of objects of natural history, besides a library of 50,000 volumes and 2566 manuscripts. [BRITISH MUSEUM.] His fame however does not rest merely on his collection; he contributed many papers to the 'Philosophical Transactions.' Before he was appointed secretary to the Royal Society, the publication of these Transactions had been suspended for six years; he resumed their publication, and continued to superintend it till 1712. He likewise wrote a pamphlet on sore eyes, which had considerable repute for many years. But his great work was the 'Natural History of Jamaica,' which appeared in two volumes, folio, with many plates, of which the first volume was published in 1707, and the second twenty years after. The first volume contains an introduction comprising a description of the island, its climate, products, and the diseases of its inhabitants, followed by an account of the plants indigenous there and in other of the West India Islands; the trees and animals are described in the second volume. He mentions in his preface that the whole undertaking had been submitted to Ray, and met with his approval, though it did not receive any emendations from him. A small Latin catalogue of the plants of Jamaica had been published by him in 1696, and serves as a sort of index to the large work. Notwithstanding his diligence in studying natural history, Sir H. Sloane appears not to have fully appreciated the benefits of scientific arrangement, and he contents himself in his writings with referring plants to genera and species already known, and made no attempt to improve the very defective classification of that day.

SLO'ANEA, a genus of fine trees of the natural family of Tiliaceæ, named by Plumier in honour of Sir Hans Sloane, a former president of the Royal Society, and well entitled to the compliment from his investigation of the Flora of Jamaica, and from his being the founder of the Chelsea Botanic Garden, as well as a patron in general of science. The genus Sloanea is divided into five sections, each of which may probably form a genus. The leaves are large and alternate, the flowers are large, and the fruit as big as chestnuts. The trees are not known to be applied to much use, with the exception of *S. dentata*, of which the wood is sometimes employed for making canoes of a single piece. The inner bark is astringent, and prescribed in dysentery; the fruit is eaten.

SLOBODE UKRAINE, or the government of the Slobodis of Ukraine, in European Russia, is one of the provinces of southern Russia, which, after successive invasions from Lithuanians and Mongols, came into the possession of the Czars about the beginning of the seventeenth century. It appears to have been originally tributary to the grand-duchy of Kieff: it formed part of the government of Bielgorod, which was constituted in 1726, and did not obtain its present appellation until 1765. It bore the name of Kharkof in the interval between 1780 and 1796, in which year Paul I. declared that it should be called the government of the Slobodis of Ukraine. The term *Sloboda* belongs in Malo-Russia to the villages inhabited by Cossacks, who were formerly organised into regiments, free from all taxes, and had no master but their own will. The tract of land of which we are speaking being almost uninhabited in 1651, the emperor Alexey Michaelowich allowed the Cossacks of western Ukraine to settle in it, and to enjoy the privileges guaranteed to them by Stephen Battory, king of Poland. They then founded five large villages or 'Slobodis;' and from this circumstance the name is derived.

The government of the Slobodis of Ukraine is bounded on the north by that of Kursk, on the east by the country of the Don Cossacks, on the south it has the government of Yekaterinoslaf, and on the west that of Poltáva. It contains about 19,000 square miles, 6938 of which are arable land and 2000 forests. The country is generally flat, and the soil fertile, yielding frequently more than five millions chetwerts (2,750,000 quarters) of corn, two millions of which are surplus produce, and may be exported. The forests in this government belong chiefly to the crown; game is scarce, but the forests abound in wolves and foxes.

The population consists of Malo-Russians, Cossacks, Great Russians, German colonists, converted Calmucks, Jews, and Gypsies, and amounts to 1,250,000 (according to an estimate taken in 1835), of whom 35,000 are Cossacks. Besides the military population of Cossacks, there are five colonised regiments of cavalry, who occupy the districts of Chuguyef, Volchansk, Izyum, Kupyansk, and Starobyelsk; the number of districts belonging to the government is eleven, viz. Kharkof, Akhtyrko, Lebedin, Sumy, Valki, Zmiyef, and the above-mentioned military colonies.

The chief occupation of the inhabitants of Slobode Ukraine is agriculture, although various means have been used by the government and the nobles to draw their attention to manufactures and commerce. The cultivation of mulberry-trees for the production of silk was introduced in the reign of Alexander I., but it does not seem to have been successful. It is probable however that the depressed state of commerce in this government is owing to the badness of the roads and the want of navigable rivers. The only stream which could have been made use of for the purpose of transporting goods is obstructed by corn-mills and hide and tallow factories. This is the Syevernoy Donyets, the principal river of the government, which, after receiving the Oskol in the neighbourhood of Izyum, falls into the Don. The other rivers are the Vorskla and the Psiol, both falling into the Dnieper, the former of which belongs to the southern districts, and the latter to the northern.

The inhabitants are all of the Græco-Russian church, with the exception of a few Lutherans and some Jews; they belong to the eparchy of the Slobodās of Ukraine and Kharkof, which was erected towards the end of the last century. This diocese contains 628 churches, seventeen of which are cathedrals, and one monastery and one nunnery.

There were in 1832 thirty schools with 200 masters and 1938 pupils, 133 of whom were girls. These establishments for public instruction are all under the control of the university of Kharkof, which was established in 1805, and has authority over a district comprising the governments of Sloboda Ukraine, Poltâva, Kursk, Orël, and Vorônets.

The chief town is Kharkof, founded in 1652. [Charkow.]

The other towns of this government are the following: Akhtyrka, the chief place of the district which bears its name, situated on a small river which falls into the Vorskla; it contains eight churches, one of which attracts a great number of pilgrims from possessing a miraculous image of the Holy Virgin. Sumy, remarkable for its extensive traffic in horses. Chuguyef, on the Psiol, containing 9000 inhabitants, of whom many are converted Calmucks. Izyum, which is a fortified town containing four churches and about 4000 inhabitants; it is situated between the Oskol and the Donyetz, in the extreme south of the government. Slavyansk, in the neighbourhood of which city there are four saline lakes. Besides these towns there are Lyebedin, Volchansk, Zmiyef, Miropoloye, Nyedrigaylof, Krasnokutsk, Zolochef, Kupyansk, and Valki.

SLOE. [Prunus.]

SLOTH. [Ai; Unau.]

SLOW LEMUR. [Stenops.]

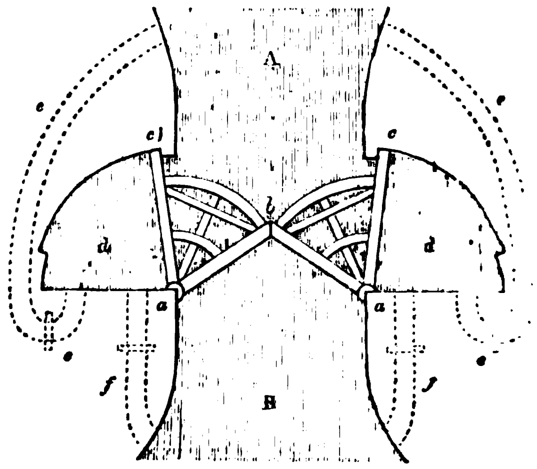
SLOW WORM, one of the English names for the Blind Worm. And see also Orvet; Saurians; Scincoïdians.

SLUGS. [Limax.]

SLUICE. (In Dutch, *Sluis*, in which language it is defined to be 'a mass of masonry and closing doors, to keep water in, or to stop the flow of water. The word *Sluis* occurs in the names of various places in Holland, as Hellevoetsluis.) In a limited sense this name is almost confined to the sliding gates commonly used in mill-streams, ponds, sewers, &c., to retain the water when necessary, or to allow it to escape in any required quantity; such gates being usually raised and lowered by means of a rack and pinion attached to the upper part of the frame in which they slide. In a more extended application of the term, it embraces all kinds of floodgates, flaps, and other apparatus used to stop, collect, or retain water, and to let it off as occasion requires. According to this use of the word, a canal lock may be considered as a double sluice.

Sluices are extensively used in most hydraulic works, and vary much in their construction, according to the purposes for which they are required. In mill-streams they serve to keep back the water when the mill is at rest, and to regulate the supply when it is going. They also act as *wasters*, to allow the surplus water of a reservoir to escape. For these purposes many self-acting sluices have been contrived, to avoid the inconvenience and even danger which might arise from neglect, as well as to save the expense of a sluice-keeper. In Brewster's *Edin. Journal of Science*, vols. ii., iii., and iv., several ingenious arrangements of this sort are described and illustrated; most of which have been successfully used by their inventor, a Scotch gentleman named Thom. Some of these are regulated by floats; and others by the weight of iron cans, so situated as to fill with water when it rises in the reservoir to a certain height, while they are made to empty themselves when it is necessary to close the sluice. In one of the plans for a waster-sluice, the sluice-gate is balanced by a weight, capable of sliding freely up and down in a cylindrical vessel which communicates with the water at the highest required level, and has a small pipe from its lower extremity to allow the water to run out as soon as the water in the reservoir sinks below that level. The weight is so adjusted as to hold the sluice-gate closed so long as the cylinder is empty, while it is insufficient to do so when the cylinder is full of water: the useful effect being produced by the difference between the gravity of the balance-weight when suspended in air and in water.

The construction of an ordinary canal-lock has been described in the article Canal, vol. vi., p. 220. It is necessary to make the large gates meet in an angle in the middle of the stream, in order that they may be able to resist the pressure of the water; and as this pressure would render it impossible to open them against any considerable head of water, small sluices are provided, either in the gates or in the masonry of the lock, by which the water may be let in or out at pleasure. In locks exposed to the sea or to a tide river, a double set of gates are sometimes used; one set pointing outwards, to exclude the high tide, and the other inwards, to bear the pressure of the water in the canal when the tide is below it. An admirable contrivance for meeting all the contingencies of such a situation is the *fan-gate* sluice or lock; of which a full description, with engravings, is given in Brewster's *Edin. Journal of Science*, vol. iii. It was invented by Mr. Blanken, of the Netherlands, and has been found completely successful. The subjoined cut will explain the principle of the apparatus, applied merely as a sluice capable of bearing a head of water in either direction; of being opened against a head of water; or of being closed while the current is rushing through. In this diagram *a, b*, and *b, a*, are the sluice-gates meeting in the centre of the stream, and capable of resisting the pressure of a head of water at A. These gates are pivoted at *a, a*, and are connected, by very strong framing, with the tail-gates *a, c*, which move with them, and fit closely to curved recesses of masonry, *d, d*. The tail-gates are, as shown in the plan, about one-fifth wider than the sluice-gates: *e, e*, are small tunnels in the masonry, communicating between the head of water at A and the spaces *d, d*; these being provided with small sluices by which they may be opened or closed at pleasure: *f, f* are similar tunnels, also provided with sluices, communicating between the water at B and the side spaces *d, d*. If the gates be required to exclude a head of water at A, the tunnels *e, e* are opened, and the water, rushing through them, fills the side spaces to the level of A; the gates being thereby held close. If the head of water to be sustained be at B, the tunnels *e, e* are closed, and those marked *f, f* opened; and then, although the pressure of the water tends to open the sluice-gates, the water rising to the same level in *d, d*, and there acting upon the larger superficies of the tail-gates *a c* keeps them closed. By reversing the use of the tunnels *e, e*, and *f, f*, the gates may be released from pressure in either direction, and therefore be easily opened; while by using them in the order first described the gates may be closed when the stream is rushing through. The illustration given by Brewster is a lock at Gorinchem in Holland,



forming a communication between the tidal river Lingy and the canal of Ghisendeck. The arrangement resembles that of the above diagram, the chamber of the lock being in the place of K, and its other end being closed by a pair of common gates opening towards the river.

SLUR, in Music, a curved line (⌒) more or less extended, as may be required, drawn over two or many notes. If placed over two notes on the same line or space, it signifies that the second is not to be repeated, though to be held out its full time. When drawn over notes on different degrees, it signifies that they are to be *legato*, i.e. tied—played in a smooth, blending manner. This character is sometimes called a *bind*, and also a *tie*.

SLUYS (in French, *L'Ecluse*), is a very strongly fortified town in the province of Zealand, in the kingdom of the Netherlands. It is situated in 51° 18′ 30″ N. lat. and 3° 20′ E. long., on a small bay of the German Ocean called the Zwin, at the mouth of the Schelde, and is connected by a canal with the city of Bruges, which is about 10 miles distant. The harbour, which was formerly deep and clear, is not now capable of admitting any but small vessels. It is surrounded with sluices (whence its name), by which, in case of a siege, all the surrounding country can be laid under water. It has about 1400 inhabitants. It was taken by the French in 1794.

SMALAND. [SWEDEN.]

SMALL-POX (*Variola*). It is a subject of dispute whether this disease was known to the ancients, or whether it has originated at a comparatively recent date. Those who contend for its antiquity refer us to the account of the plague of Athens by Thucydides (ii. 49, B.C. 430), which, they say, is as accurate a description of the leading symptoms of Variola as could possibly be expected from any historian who is not a physician. Those who hold the opposite opinion call in etymology to their aid; the word *pock* or *pox*, they say, is of Saxon origin, and signifies a bag or pouch; the epithet *small* in England, and *petite* in France, were added in the fifteenth century. The term variola is derived from the Latin word *varus*, a pimple, or *varius*, spotted; and, according to Moore, the first authentic passage in which it occurs is to be found in the 'Bertinian Chronicle' of the date 961. The first author however who treats expressly of small-pox is Rhazes, an Arabian physician [RHAZES], but even he confounded it with measles, and these two diseases continued to be considered as modifications of the same disorder till the time of Sydenham. Small-pox, when it occurs naturally, is preceded by the usual premonitory symptoms of eruptive fevers, such as rigors, pains in the back and loins, prostration of strength, loss of appetite, nausea, and sometimes vomiting, and, in young children, frequently convulsions. About forty-eight hours after the commencement of these symptoms an eruption of small, hard, red-coloured pimples makes its appearance about the face and neck, and gradually extends downwards over the trunk and extremities. The primary fever, as it is called, now lessens; but the pimples increase in size, and become converted into whey-coloured pustules with a depression in their centre. On the eighth day they are at their height, and on the eleventh the matter oozes from them and concretes into crusts, which fall off about the fourteenth day, leaving the skin of a brownish-red colour, and studded with slight depressions or pits. As the eruption travels from above downwards, the parts of the body successively attacked by it become affected with swelling, the mouth waters, and the voice is hoarse; when the maturation has taken place, these symptoms subside, but a secondary fever commences, which is sometimes more severe than that which preceded the outbreak of the eruption. Small-pox, according to its severity, is distinguished by authors into two varieties, the *distinct* and the *confluent*, variola discreta and confluens. In the former, the pustules are few in number, well formed, and do not touch each other, and the fever is inflammatory, but mild; in the latter, the disease altogether is more violent, the eruption more general, and the pustules small and unhealthy, run into one another. The fever likewise is greater, and rather of the typhoid character, is not mitigated on the appearance of the eruption, and is much aggravated at its termination; there is delirium, considerable prostration of the vital powers, ptyalism, inflammation of the fauces, and frequently diarrhœa. Petechiæ and an unhealthy exudation from the body often accompany this form of the disease. Among the mucous membranes, the larynx and trachea suffer much, and children often die of suffocation from this cause; the extent of mucous and of cutaneous inflammation however are not always necessarily proportioned to each other. Small-pox rarely attacks the same individual more than once, and, like measles and scarlatina, its consequences are sometimes more to be dreaded than the disease itself. During the secondary fever, an intense form of ophthalmia frequently sets in, which rapidly involves all the structures of the eye, and in the course of a few days destroys its entire organization. Although it is not common to have both eyes thus affected, still a large proportion of the blind at our public institutions owe their misfortune to this disease. Pleurisy, consumption, scrofula, obstinate diarrhœa, and a fetid discharge from the ears attended with more or less deafness, are the principal diseases liable to result from a severe attack of small-pox. The immediate cause of this disease is a peculiar miasm or poison received into the system from an individual labouring under the same affection, and it is said to make its appearance in from twelve to fourteen days after exposure to the contagion; when however it is communicated by inoculation, it appears on the seventh or eighth day. Instances are recorded of mothers who were exposed to the infection of small-pox, communicating the disease to the fœtus in utero, without being themselves affected by it; and, what is equally remarkable, women suffering from small-pox during pregnancy, have brought forth healthy children, who did not take the disease till they were inoculated. Small-pox is frequently epidemic, especially in the spring, and, like all other epidemics, those who are first attacked by it suffer the most severely: it is observed also to be greatly influenced by certain conditions of the atmosphere.

Small-pox can be communicated by inoculation with the matter of its pustules, and the resulting disease being rendered milder by this operation, it was formerly much practised to guard the individual against a spontaneous attack; since however the introduction of vaccination by Dr. Jenner, the practice has been deservedly abandoned. Vaccination was supposed by its discoverer to secure the individual permanently and effectually from the contagion of the small-pox; more extended experience has proved, that although it does not always prevent it, yet it so shortens its duration and moderates its violence, that a death from small-pox after vaccination is a rare occurrence. A difference of opinion prevails respecting the character of the eruption which occasionally appears after exposure to variolous infection in persons previously vaccinated. According to many, it is nothing more than chicken-pox; while others affirm that it is really small-pox, although modified by the controlling influence of the cow-pox. The truth appears to be, that 'modified small-pox' resembles the chicken-pox in its mildness and duration, but differs from it in its originating from the 'variolous germ,' and in its power of communicating the true small-pox to others, as well by inoculation as by infection.

The history of the different epidemics of small-pox shows the mortality to be one in four of those attacked who had not been vaccinated; whilst of those who had undergone vaccination the proportion was not one in 450. From the register kept at the Small-pox Hospital in London, it appears that the mortality at this institution is considerably greater than one in four, having averaged during the last fifty years 30 per cent., the extremes being 18 and 41. From the same source we learn that the greatest number of deaths occurs on the eighth day. Of 168 fatal cases, there died in the first week 32; in the second, 92; in the third, 21; and in the fourth and after, 16. The causes of death at these different periods are the following:—1st week, malignant fever; 2nd week, affections of the throat, and consequent suffocation; 3rd week, or during the secondary fever, febrile excitement, mortification of large portions of the integuments, pneumonia, pleurisy, or laryngitis; 4th and following weeks, exhaustion, erysipelas, or some of the diseases before enumerated as liable to result from small-pox. It was formerly supposed that the eruption of variola was not confined to the skin, but invaded also the internal parts; this is not the case, the internal affections are simply inflammatory, and do not partake of the specific character of the cutaneous disease.

No peculiar plan of treatment is required for small-pox; it is that of ordinary fever: cleanliness, free ventilation, an attention to the strength of the patient, and a watchfulness against accidental complications, are the principal points to be kept in view. During the eruptive stage of the disorder, the bowels should be kept moderately open by saline aperients, and the occasional exhibition of a mild mercurial. The temperature of the skin may be regulated by cool air, or by sponging it with tepid vinegar and water; if there should be much unpleasant effluvium from the surface of the body, washing it with a weak solution of one of the chlorides will be found to correct this. It has been recommended by some writers, and has been long a practice in Eastern countries, to pierce the pustules with a fine needle; this procedure, it is said, lessens the violence of the secondary fever, and prevents pitting. M. Serres, with the same object, directs the application of lunar caustic to the pustules on the fourth day. As a general rule, we should say that venesection is not admissible at any period of small-pox; indeed we have no hesitation in affirming that some of the severest consequences of the disease may be averted by a judicious employment of measures of an opposite tendency to blood-letting. The sloughing of the integuments, and the intense ophthalmia, rapidly terminating in entire loss of vision, are eminently connected with an enfeebled and cachectic state of body; and the best mode of averting these evils is to have recourse early to those remedies which are most efficacious in arresting their progress. Hence bark or its preparations, combined with the mineral acids, sarsaparilla, wine, brandy, if the powers are much reduced, and animal food, if the patient can eat it, must be perseveringly administered. It may not be out of place here to mention that the character of the ophthalmia termed *variolous* has only lately been pointed out to the profession by Mr. Marson of the Small-pox Hospital. It had been supposed that the eye was lost in small-pox from one or more of the pustules of this disease forming on the cornea. Mr. Marson has shown not only that this never takes place, but that the loss of vision is attributable to ulceration or sloughing of the cornea, which comes on generally about the eleventh or twelfth day of the disease. The patient is nearly always in a state of great debility, and requires tonic medicines and nutritious diet to give him a chance of escaping from the destructive effects of this ophthalmia.

SMALT is a glass coloured of a fine blue, by means of oxide of cobalt. [COBALT.] When reduced to an impalpable powder, it is employed to give a blue tint to writing-paper and linen.

SMART, CHRISTOPHER, was born at Shepburne in Kent, April 11, 1722. He was educated at Durham and Maidstone schools, and at Pembroke Hall, Cambridge, where he was sent October 30, 1739. Here he distinguished himself by his classical attainments; he was elected a fellow of Pembroke Hall, July 3, 1745. He gained the Seatonian prize for five successive years: the subjects of the prize poems were respectively the Eternity, the Immensity, the Omniscience, the Power, and the Goodness of the Supreme Being. In 1753 he quitted Cambridge on his marriage with Miss Ann Maria Carman, and afterwards resided in London, endeavouring to make a livelihood by trifling literary undertakings. He became engaged in an altercation with Sir John Hill, who criticised his poems, and Smart in revenge published a satire called the 'Hilliad.'

In 1754, in consequence of pecuniary embarrassment and other mortifications, he became deranged, and continued in this condition, with intervals more or less lasting of sanity, till his death, May 18, 1770, in the rules of the King's Bench, where he had been confined in his latter years. Smart translated the Psalms, Phædrus, and Horace into prose; and in 1752 published a small collection of poems, to which he made subsequent additions. His productions have sunk into deserved oblivion. He seems to have been a weak improvident man, not destitute of good qualities, such as gained the favour of several of the nobility, and the friendship of Garrick and Johnson, the latter of whom has written an account of him. His poems were printed in 1791.

SMEATHMA'NNIA, a small but beautiful genus of plants belonging to the natural order Passifloraceæ. It was named by Solander in honour of Smeathmann, a German botanist, who travelled in many parts of Western Africa, and collected plants, especially at Sierra Leone, of which place this genus is exclusively a native. The genus possesses a one-leaved nectarium, which is urceolate and surrounding the base of the stamens. The stamens are numerous, distinct, and seated on a short column with incumbent anthers; the stigmas are peltate and five in number; the capsule is inflated, and four- or five-valved; the seeds are dotted. All the species are upright shrubs, with white, showy, axillary flowers. Three species are recorded, *S. pubescens*, *S. lævigata*, and *S. media*. In cultivation they succeed best in a mixture of loam, peat, and sand. They may be easily propagated by sticking cuttings in the same soil under a bell-glass.

SMEATON, JOHN, was born, according to most authorities, on the 28th of May,[*] 1724, as Austhorpe, near Leeds, in a house built by his grandfather, and long afterwards inhabited by his family. His father was an attorney, and brought him up with a view to the legal profession. Our information respecting the domestic history of Smeaton is exceedingly scanty; it amounts to little more than that he very early displayed a taste for mechanical pursuits; delighting, it is said, even when a child in petticoats, to observe mechanics at work, and to question them respecting their employments. One of his biographers states that his toys were the tools of men; and that, while yet little more than an infant, he was discovered one day on the top of his father's barn, fixing something like a windmill. But passing over such symptoms of precocity, the evidence of which must always be received with caution, we find him, at the age of fourteen or fifteen, constructing a machine for rose-engine turning, and producing neat ornamental boxes, &c. for his friends. He appears to have been but little older when he cut, in a lathe of his own manufacture, a perpetual screw in brass, according to the design of his intimate friend Mr. Henry Hindley of York, with whom he joined enthusiastically in mechanical pursuits. By the age of eighteen years he had attained much practical skill in mechanical operations, and had furnished himself with many tools for performing them.

About this time, in the year 1742, in pursuance of his father's design, young Smeaton came to London, and attended the courts of law at Westminster Hall; but finding the bent of his mind averse to the law, his father yielded to his wishes, and allowed him to devote his energies to more congenial matters. The next circumstance in his history related by his very brief biographers is his taking up the business of a mathematical-instrument maker, about the year 1750, when he was residing in lodgings in Great Turnstile, Holborn. In 1751 he tried experiments with a machine that he had invented for measuring a ship's way at sea; and in 1752 and 1753 was engaged in a course of experiments 'concerning the natural powers of water and wind to turn mills and other machines depending on circular motion.' From the latter investigation resulted the most valuable improvements in hydraulic machinery. In the construction of mill-work, Smeaton, during the whole of his useful career as a civil engineer, stood deservedly high; and, by his judicious application of scientific principles, he increased the power of machinery impelled by wind and water as much as one-third. The results of these experiments were published in 1759, after he had been able to give them a practical trial; and their value obtained for him the Copley gold medal of the Royal Society in that year. Smeaton had previously, in the year 1753, been made a member of the Royal Society; and he had made some communications to the 'Transactions' even before that date. In 1754 he visited Holland and the Netherlands; and the acquaintance he thus obtained with the construction of embankments, artificial navigations, and similar works, probably formed an important part of his engineering education.

In 1766 Smeaton commenced the great work which, more than any other, may be looked upon as a lasting monument of his skill—the EDDYSTONE LIGHTHOUSE [IX. pp. 268, 269]. Two lighthouses had been erected on the Eddystone or Edystone rock, before the admirable structure of Smeaton; of which the first was swept away in a storm, and the second, which was formed of timber, was destroyed by fire in December, 1755. The immediate re-erection of the beacon being highly important, Mr. Weston, the chief proprietor, lost no time in applying to the earl of Macclesfield, then president of the Royal Society, for advice as to the person who should be entrusted with the difficult task. The previous structures had been designed by non-professional men; and it was felt now, to adopt the language of Smeaton's narrative, that to erect another 'would not so much require a person who had merely been bred or had even rendered himself eminent in this or that the profession; but rather one who from natural genius had a turn for contrivance in the mechanical branches of science.' The earl immediately perceived that Smeaton was the man required, and therefore recommended him. Although a great portion of the lease under the proprietors of which the lighthouse had been erected was expired, and their interest in the undertaking was consequently limited to a comparatively short time, the proprietors liberally entered into Smeaton's views respecting the superior advantages of a more durable material than timber, and determined on the adoption of his plans for a stone structure of the greatest possible strength. The working of the rock for the foundation of the building was commenced on the 5th of August, 1756; the first stone was landed upon the rock June 12th, 1757; the building was finished on the 9th of October, 1759, and the lantern lighted for the first time on the 16th. During this time [illegible] days' work done upon the rock.

---

[*] June 18th is the date given in the 'Encyclopædia Britannica;' but no explanation is offered of this deviation from, as far as the writer can ascertain, all other authorities.

Smeaton appears to have been by no means fully employed as an engineer for several years after the completion of the Eddystone lighthouse; for in 1764 he became a candidate for the office of a receiver of the Derwentwater estate, the funds of which were, after its forfeiture in 1716, appropriated to Greenwich Hospital. On the last day of that year chiefly, as he states in his account of the Eddystone lighthouse, through the friendship of the earl of Macclesfield and earl Howe, lords of the admiralty, he was appointed to this office. In this engagement he was happy in being associated with Mr. Walton, the other receiver, who took upon himself the management of the accounts, leaving Smeaton at leisure to devote his attention to improvements and to professional engagements. While he held the receivership he greatly improved the estates, the mines and mills of which required the superintendence of such a man to make them of their full value. Increasing business induced him, in 1775, to desire to relinquish this engagement, but he was prevailed on to retain it about two years longer.

Of the many useful works executed by Smeaton, Ramsgate harbour perhaps holds, next to the Eddystone lighthouse, the most prominent place. This work was commenced in 1749, but was carried on with very imperfect success until it was placed under his superintendence in 1774. This harbour, being enclosed by two piers, of about 2000 and 1500 feet long respectively, affords a safe refuge for ships where it was much needed, vessels in the Downs having been exposed to imminent risk during bad weather before it was constructed. Smeaton laid out the line of the great canal connecting the western and eastern shores of Scotland, from the Forth to the Clyde, and superintended the execution of great part of it. To his skill, in all probability, the preservation of old London bridge for many years was attributable. In 1762, in consequence of alterations made for the improvement of the navigation, one of the piers was undermined by the stream to a fearful extent. The bridge was considered in such danger that no one would venture to pass over it; and the engineers were perplexed. An express was therefore sent to Yorkshire for Smeaton, who immediately sunk a great quantity of stones about the endangered pier, and thereby preserved it. The Calder navigation was one of the great works which he successfully accomplished; and he provided with much skill for the effect of the impetuous floods to which that river is subject. The Spurn lighthouse at the mouth of the Humber, some important bridges in Scotland, and many other works of like character might also be mentioned.

About 1785 Smeaton's declining health rendered it necessary for him to avoid entering upon many new undertakings. He then devoted much attention to the publication of an account of the Eddystone lighthouse, which was to have been followed by a 'Treatise on Mills,' and other works embodying his valuable experience as an engineer. The former of these was the only work he lived to complete; and it is a volume of great and permanent interest, detailing in the most minute and simple manner every circumstance worthy of record concerning the history or the construction of the lighthouse. It is dedicated to George III., who had taken much interest in the structure; and in the dedication, in explaining the circumstances which had delayed the appearance of the narrative so long after the completion of the building, the author observes, 'I can with truth say, I have ever since been employed in works tending to the immediate benefit of your majesty's subjects; and indeed so unremittingly, that it is not without the greatest exertion that I am enabled even now to complete the publication.' He had made some progress in this work before 1763; but it appears to have been laid aside for about twenty years, and was not published until 1791. On the 16th of September, 1792, while walking in his garden at Austhorpe, Smeaton was seized with an attack of paralysis; and on the 28th of October he died.

About the year 1771 several friends of Smeaton, engaged in kindred pursuits, formed themselves into a society, which may perhaps be looked upon as the first public recognition of the useful body of men who have since, under the name of Civil Engineers, done so much in developing the resources of this country. Untoward circumstances led to the dissolution of this society previous to Smeaton's death, but steps were taken to re-organize it before that event took place. The new Society shortly took steps for the publication in a collected form of Smeaton's numerous professional reports; but the work was not completed until 1812. It is in three quarto volumes, to which a fourth was subsequently added, consisting of his miscellaneous papers communicated to the Royal Society, &c. The Society alluded to is mentioned in the first volume of the 'Transactions of the Institution of Civil Engineers' as still existing. The introduction to this volume contains a high eulogium on the talent of Smeaton as an engineer. Alluding to the Eddystone lighthouse, it observes, 'Thus Smeaton's first work was also his greatest; probably, the time and all things considered, it was the most arduous undertaking that has fallen to any engineer, and none was ever more successfully executed. And now, having been buffeted by the storms of nearly (now more than) eighty years, the Eddystone stands unmoved as the rock it is built on—a proud monument to its great author. Buildings of the same kind have been executed since, but it should always be borne in mind who taught the first great lesson, and recorded the progressive steps with a modesty and simplicity that may well be held up as models for similar writings. His Reports are entitled to equal praise; they are a mine of wealth for the sound principles which they unfold and the able practice they exemplify, both alike based on close observation of the operations of nature, and affording many fine examples of cautious sagacity in applying the instructions she gives to the means within the reach of art.' The deliberation and caution always exercised in the works of Smeaton are well worthy of imitation; and to this may be attributed the almost unexampled success of his undertakings. So highly was his judgment appreciated, that he has been called the 'standing counsel' of his profession, and he was constantly appealed to by parliament on difficult engineering questions.

His improvements of wind and water mills have been mentioned already. The atmospheric steam-engine of Newcomen was the subject of similar experiments, attended with the like results; although the more important improvements of Watt threw Smeaton's efforts in this way comparatively into the shade. His improvements consisted chiefly in the proportions of the component parts of the machine; yet they effected so great a saving of fuel, that Boulton and Watt excluded them from their ordinary agreement—which was, to receive for the use of their patent right one-third of the coal saved by their machine in comparison with those previously used. The low state of the mechanic arts in England led Smeaton, during the early part of Watt's career, to doubt the possibility of his machines being made with the required accuracy.

Smeaton also introduced many improvements in mathematical apparatus, and had an ardent love for science. He was particularly attached to astronomy, and had an observatory at Austhorpe, where, even during the most active part of his career, he occasionally resided.

In person he was of middle stature, broad and strong made, and of good constitution. His manners were simple and unassuming. His temper was warm, but not overbearing; and his social character unimpeachable. Very little is recorded of his private history; but his daughter, Mary Dixon, in a letter prefixed to his 'Reports,' gives a pleasing account of his character as a husband, parent, and friend. He was by no means grasping or avaricious, as many anecdotes related of him seem to show. The empress Catharine of Russia was at one time very desirous of engaging his services, and offered him his own terms; but the princess Dashkaw, by whom the request was communicated, found him to be, as she said, a man who had no price.

The principal authorities consulted for this article are a short memoir by Smeaton's intimate friend Mr. Holmes, a watchmaker, then residing in the Strand, which was published separately in 1793, and appeared also in the 'European Magazine' and the 'Annual Register' for that year; and the memoir prefixed to his 'Reports.' Some particulars have been gleaned also from his own 'Narrative' respecting the Eddystone lighthouse.

SMELL. The essential part of the organ of smell consists of the expansion of the olfactory nerves, the first or most anterior of the nerves from the brain, whose minutest branches are distributed just beneath the mucous membrane of part of the nose.

In man the framework of the nose is formed in part of bone and in part of cartilage. Of that part which is prominent on the face, the upper portion only is formed of bone, consisting of the nasal bones in the middle, and the nasal processes of the superior maxillary bones on each side. The lower and lateral portions, termed the Alæ, which bound the nostrils, are formed chiefly of cartilage. The nasal cavities, to which the nostrils lead, extend to the forehead above and to the pharynx behind; they are separated from each other by a middle partition. They are bounded on each side, in front, by the nasal bone and the meeting of the septum and alæ; above, by the cribriform plate of the ethmoid bone; below, by the palatine processes of the upper jaw and palate bones; behind, by the body of the sphenoid bone; on the inner side by the septum; and on the outer by the ala, by the ascending plates of the upper jaw and palate bones, the lacrymal, and the orbital plate of the ethmoid bone, and the internal pterygoid processes of the sphenoid, between which is the aperture from the nose into the pharynx. Within these cavities there hang, on each side, the three turbinated bones, the spaces above and within which are occupied by the fine cells and laminæ of bone forming the ethmoidal cells, which communicate with the frontal, maxillary, and sphenoidal sinuses.

Of these complicated cavities, the several parts of which are described in the article Skeleton, a small portion only is devoted to the sense of smell. The rest is subservient either to respiration, the passage through the nose being that by which in most animals the air passes to the lungs, or to the voice, of which the cells and the several sinuses near the nose seem destined to increase the resonance. All the surfaces within the nose are covered by a layer of thin, tough, and very vascular mucous membrane, the Schneiderian membrane, whose structure is simple, possessing neither papillæ, villi, nor glands, and which secretes in every part a small quantity of clear viscid mucus.

The olfactory nerves descend from the under surfaces of the olfactory bulbs [Brain] through the foramina of the cribriform plate of the ethmoid bone. They are very numerous, and are densely distributed in bundles and tufts in the mucous membrane covering the upper part of the septum, the under surface of the cribriform plate, and the inner surfaces of the superior and middle turbinated bones, and of the cells immediately adjacent to them.

The human organ of smell is less developed than that of other mammalia, in most of whom the turbinated bones, and all the parts to which the olfactory nerves are distributed, are much larger and more complicated in their form. In birds also the extent of the surfaces of these parts is proportionally much greater than in man, in correspondence with the greater acuteness with which they smell. In fish the nose is merely a depression, without any aperture into the pharynx; the olfactory membrane lining it has its surface extended by being developed in numerous folds and tufts. The closure of the nasal passage behind is one of the most constant of the characters distinguishing fish from amphibia, in the majority of which also there are not mere tufts of membrane, but well-developed turbinated bones, with the mucous membrane spread out upon them. In invertebrata the organs of smell are not clearly known, though there is little doubt that some of them exercise the sense.

All that is necessary for the perception of an odour is that the scented particles (without undergoing any such changes as light does in arriving at the retina, or sound on its way to the auditory nerve) should come in contact with the surface under which the olfactory nerves lie, with the force of rather more than an ordinary inspiration. If the medium containing the odour be at rest, or be only gently forced against the membrane, no impression is produced.

In different animals the sense of smell is adapted chiefly to that class of substances on which they feed. The carnivora, for example, have an acute sense of the odour of animal substances, but, so far as we can discern, none for that of vegetables; and, on the other hand, herbivora are as clear in their perception of the latter, and as nearly insensible to the former. Man, as his food is mixed, so also is his sense of smell adapted to both classes of substances, though for each less acute than that of the animals that feed exclusively on the one or the other. In the choice of food, which is the main object of the sense of smell, man generally, though almost unconsciously, and animals always, exercise the precaution of smelling, and they instinctively form a judgment according to the impression received. In eating, also, much of that which is commonly attributed to the sense of taste depends on the odour of the food carried from the mouth to the nose. In eating cinnamon, for example, or any similar aromatic substance, if we close the nostrils, we perceive no flavour, and, except for the stinging of the tongue, might imagine ourselves eating a tasteless wood. And, in like manner, we often mistake for those of odour the impressions made by substances on the nerves of common sensation with which the lining membrane of the nose is abundantly supplied; for example, in smelling ammonia, vinegar, and other acrid substances, the impression which we regard as their odour is compounded of this and of the irritation of the nerves of common sensation: and the nose of an animal whose olfactory nerves are destroyed is hardly less sensible to this latter irritation than that of one in which the nerves are entire. Facts of this kind have led to the error of supposing that the olfactory are not the only nerves of smell; they only prove that the sense of smell has a more limited range than is commonly supposed. The same substances, ammonia and the like, which irritate the common sensitive nerves of the nose, act in the same manner on the eye or any equally delicate part; but in the nose alone is this irritation accompanied by any peculiar sensation of odour by which one such substance can be distinguished from another. This perception of odour, independently of irritation, is the proper function of the olfactory nerves, which are thus strictly nerves of peculiar sensation, of the same class with the optic, auditory, and gustatory. [Nerve; Senses.]

SMELTING. [Iron—*Manufacture and Trade.*]

SMERDIS. [Cambyses; Darius.]

SMILA'CEÆ, a small natural order of plants belonging to Lindley's Retose group of Monocotyledons. There has been much difference of opinion amongst botanists with regard to the position of Smilax in the natural system, as well as the number of genera that ought to be admitted into the order Smilaceæ. Lindley has placed two genera, Smilax and Ripogonum, in this order, which possesses the following characters:—Flowers hermaphrodite or diœcious; calyx and corolla confounded, inferior six-parted; stamens six, inserted into the perianth near the base, seldom hypogynous; ovary three-celled, the cells one- or many-seeded; style usually trifid; stigmas three; fruit a roundish berry; albumen between fleshy and cartilaginous; embryo usually distant from the hilum. They are mostly herbaceous plants with a woody stem, and a tendency to climb. Their leaves are reticulated. This last character separates the order from Liliaceæ and its allied orders, with which it otherwise closely agrees.

Smilax is found in most parts of the world, especially in Asia and America. For the principal properties of the order see Smilax.

SMILAX, a genus of plants which gives its name to the natural family of Smilaceæ. The name occurs in Greek authors, as Theophrastus and Dioscorides, and is applied to several different kinds of plants, as the yew-tree; a species of Phaseolus or Convolvulus (σμίλαξ τραχεῖα), is Smilax aspera, which belongs to the present genus. Smilax is characterised by having a six-leaved corol-like perianth, with six stamens inserted into their base; the anthers are linear and fixed by the base; ovary three-celled; ovules solitary in each cell affixed to the apex; style very short; stigmas three, spreading; berry one- to three-celled, one- to three-seeded; seeds globular; testa membranaceous, whitish; hilum large and coloured; albumen cartilaginous; embryo very small, remote from the hilum. The species form evergreen climbing shrubs, of which a few are found in temperate, but the majority in warm and tropical regions of both hemispheres, extending south to New Holland, and north to Japan, North America, and the south of Europe. The species have fibrous [illegible] [illegible]; [illegible] prickly; leaves alternate petiolate, roundish or oblong, curved, reticulate veined, tendrils arising between the petioles; flowers [illegible] on a [illegible] [illegible], [illegible] peduncles and umbellets.

Though the original species (S. aspera) of this genus is an inhabitant of the south of Europe, those now most celebrated for yielding the different kinds of *Roots* or Sarsaparilla are natives of *South America*. But S. aspera still continues to be employed for medicinal purposes in the south of Europe, where it is called Sarsaparilla Italica, but there is no truth in the statement of its being the plant yielding Indian Sarsaparilla, which is Hemidesmus indicus. Another medicinal species is the *Smilax China*, which has a tuberous root abounding in fecula, and therefore probably useful as a demulcent, though the Chinese esteem it invigorating, and ascribe to it other virtues. It is remarkable that two Indian species, which, like the Chinese species, have tuberous roots, should be called in Hindi *hurry-chook Chinee* and *jungle chook Chinee*. These are *S. glabra* and *S. lanceaefolia*, and their roots cannot be distinguished from the China root, or *Chob chinee*, as it is called in India. A similar species is common in the southern parts of North America, and has been called *Smilax pseudo-China*, though there is reason to believe that more than one species may be confounded under this name. *S. glycyphylla* is a New Holland species, which has received its specific name from the sweetish taste of its leaves, and has been called Sweet Tea from its employment in the form of infusion, and is probably alterative and diaphoretic, as well as slightly tonic. Though the genus Smilax contains about one hundred species, few others require notice except those yielding the medicinal Sarsaparilla. It is probable that some of the species found in the Old World will be discovered to be possessed of virtues equal to the American species. Some of the Indian species have been sent by Dr. Gibson, superintendent of the East India Company's botanic garden near Poonah, to the Medical Board of Bombay, for trial in the hospitals of that presidency.

SMILAX (*Medical Properties of*). Though, according to Dr. Hancock, but one species of this rather extensive genus yields the genuine sarsaparilla, it is quite certain that the roots of many are collected, and pass under that name in commerce. The species which, according to him, furnishes the true root is a native of Guayana, growing on the elevated lands of the Rio [illegible] in [illegible] and [illegible]. Most species of smilax are provided with spines, which has given origin to the first half of the name in the Spanish language, *zarza*, a bramble, and *parilla*, a vine, from its climbing or turning habit. The former is adopted as its familiar name in the London Pharmacopoeia. The same work indicates S. officinalis (Humb., *Nova Genera et Species*, i. 271) as the source of the official article. The different kinds of sarsaparilla are better known by the names they follow in their progress towards European consumption, than by their botanical history. In describing them, it seems best therefore to adopt their commercial names.

1. Jamaica or Red Sarsaparilla. This occurs in bundles formed of the root alone, folded in a roundish mass, about a foot or more in length, and four or five inches broad. Each bundle is formed by the roots and rootlets (fibrillae, or beards, as they are technically termed), without any portion of the rhizoma (or chump) or of the aerial stem. The roots are long, slender, about the thickness of a small quill, with a dark brown furrowed or wrinkled bark. The bark is thick, easily separable from the ligneous part beneath. The ligneous part is of a light red, which assumes a deeper hue when moistened. It is easily split longitudinally, and has a central core or medulla, containing more or less starch. But for the absence of medullary rays and of rings, this root might be taken for the twigs of an Exogenous plant, to which the structure of the Smilaceae approximates in several other points. A transverse section exhibits the cuticle and epidermis, which are separated from the inner or ligneous circle by a zone of cellular tissue; then the duramen, which presents the cut or open extremities of numerous ducts; and lastly, the medulla, or pith, in the centre. The *duramen*, though porous, is of a denser texture than that of the Honduras sarsa. The taste is at first glutinous or slightly mucilaginous, then nauseous, resembling [illegible], but not very acrid or bitter. No variety of sarsa has any colour, but dirty or unwashed specimens have a faintly earthy smell.

The powder is a light reddish-brown, which, when triturated with water and tincture of iodine, changes to a blue, but of a less intense depth than the Honduras sarsa, indicative of a smaller proportion of starch in the former.

According to Mr. Pope (*Trans. Medico-Chir. Society*, [illegible], p. 340), 'the whole medical efficacy resides in the bark; and the root, deprived of its cortical part, contains only pith and tasteless woody fibre.' The tasteless character of the wood renders this statement very probable. He further says, 'The cortical part gives out nearly the whole of its virtues by cold infusion in distilled water, very readily to lime-water or water slightly impregnated with caustic alkali; and that boiling distilled water extracts all its virtues.' He deems the quantity of extract yielded by any specimen the criterion of its excellence. Judged by this standard, the Jamaica sarsa is manifestly the best. His experiments have been confirmed by those of Mr. Battley, and by Thubeuf, the latest inquirer, who from six pounds of Jamaica sarsa obtained 22 ounces of extract, while a similar quantity of Lisbon sarsa yielded only 13 ounces, and of Honduras sarsa 14 ounces.

Jamaica sarsaparilla is the produce of the Spanish Main, and thence sent to Jamaica, to be forwarded to Europe. Some has been recently cultivated in that island, but it is of inferior quality. The smilax officinalis (Humboldt), which is conjectured to be the parent plant of the wild root, grows in New Granada, on the banks of the Magdalen river, near Bojorque.

2. Lisbon, Para, or Brazilian Sarsa.—The term Lisbon sarsa was also bestowed on the sort just described, for as Lisbon sarsa was till lately most esteemed, the former on its first introduction was vended under that name. The true Lisbon sarsa is the produce of smilax syphilitica, which grows both in New Granada, on the river Cassiquiare, between Mandavaca and San Francisco Solano, and in Brazil, on the Yupura and Rio Negro, by which last name it is sometimes designated. (Martius, *Reise*, iii., pp. 1212, 1230.) The Indians collect it all the year round, dry it over a moderate fire, and tie it into bundles with the flexible stem of a plant called 'Timbotitica.' To prevent its being attacked by insects, they hang it up at the gables of the houses, and sometimes gently smoke it.

It is shipped from the Brazils, mostly from Maranham, in large bundles, weighing each about one hundred pounds, which are generally remodelled in Europe, especially in Holland, and reduced to small parcels of from one and a half to two pounds' weight, the roots being cut clean off at each end, and made fast with paper and string. These bundles have a neat appearance externally, but the interior is filled up with the chumps and other rubbish. The fibres vary in thickness from that of a straw to that of a crow-quill, with little beard, and fewer longitudinal wrinkles than the Jamaica sarsa: the colour, a light, sometimes a dirty greyish yellow, or reddish-brown colour, internally white; the cortical part mealy, including a thin cellular layer, which, with the duramen, is also white. Taste at first insipid, but on prolonged mastication a sort of acrid guttural taste, without bitterness, is experienced. This kind contains more starch than the Jamaica variety, and yields a paler infusion.

3. Honduras Sarsa was the kind first introduced into medical practice, a circumstance which still leads many persons to prefer it. It generally comes over in very large bundles, weighing from one hundred to one hundred and fifty pounds, but sometimes in small round bundles. Each piece has the chump and the numerous roots proceeding from it. The chump is often two inches thick, woody, hard, and insipid. The roots are from two to four feet long, mostly thicker than those of the Jamaica or Lisbon kinds. The outer part is a dirty greyish yellow, sometimes verging to brown or reddish. The cortical part is very easily separable from the ligneous; between the epidermis and the duramen is a thick white amylaceous layer, whence a large quantity of flour or starch falls when the piece is broken across; hence the term *mealy*, applied to this variety. A transverse section exhibits a great many cut extremities of ducts, which run parallel, and are so continuous, that air can be blown from one end to the opposite of a considerable piece. This kind has no odour, and the taste is at first merely starchy and insipid, but at last acrid and guttural. The rhizoma (or chump) is altogether tasteless. The fibres and the bark are rendered black by iodine; while the rhizoma is not affected by this reagent. The

decoction of the roots is changed to an intense blue by a solution of iodine.

4. Vera Cruz Sarza is not common in the English market, but is occasionally sold under the name of Lisbon sarza. It is the produce of smilax medica (Schlecht), which grows abundantly on the eastern slope of the Mexican mountains. Externally the fibres are more furrowed than the Jamaica. The transverse section is denser in the young roots, and it is not mealy; there is little beard. The chump is always attached. It yields a deep-coloured decoction, which is unchanged by a solution of iodine. The sarsaparilla of the Caracas of French writers is deemed to be the Vera Cruz sort.

5. A kind called Lima Sarza is brought in considerable quantity to this country, and greatly resembles Jamaica sarza, for which it is said by Dr. Pereira to be extensively sold, and from which it differs chiefly in yielding a less quantity of extract.

It is manifest that the S. Sarsaparilla (Linn.), which is a native of the southern states of the American Union, yet is none of the article used at present in Europe, though it may yield a portion of what is used in the United States.

It is difficult to distinguish these different kinds of sarza by mere physical characters, but chemical tests furnish a ready and certain criterion.

Kinds.	Iodine, action of, on substance.	Infusion.			Decoction.	
		Colour.	Sesquichloride of Iron.	Tincture of Galls.	Colour.	Iodine.
Jamaica .	Turns it black, but the powder, rubbed with water and tincture of iodine, becomes blue.	Brownish-red.	Is rendered turbid but not deepened in colour.	No effect.	Clear deep reddish-brown.	Colour deepened, but not rendered blue.
Honduras	Tincture of iodine turns the roots, but not the chump, black. The powder, with water and iodine, is intense bluish-black.	Deep reddish-brown.	Scarcely affected.	No effect.	Deep brown, but not clear when cold.	Turned intensely blue.
Lisbon .	As the foregoing.	As the above.	As the above.	No effect.	Light brown.	Rendered blue.
Vera Cruz	Turns it brown, the thicker pieces rather blackish-blue.	Light brown.	More deepened.	No effect.	Deep coloured.	Scarcely affected.

'A strong decoction of Honduras sarza forms a copious precipitate (starch) on the addition of alcohol.' (Pereira.)

Besides the above-described varieties, the produce of different species of smilax, there are numerous spurious or false sarsaparillas, some from known, others from unknown sources. Italian sarza is the root of Smilax aspera, the only species native of Europe. It is a very worthless kind, and owes its reputation to a mistake by which it was considered to be the source of the Indian sarza, a truly valuable root, but which is the produce of an asclepiadeous plant, Hemidesmus indicus. German sarsaparilla consists of the rhizoma of one or more species of Carex, C. hirta and C. arenaria. It may easily be distinguished from the genuine by the numerous nodi, which are absent from the smilax. The chemical analyses of sarsaparilla furnish little practical guidance, from its not being recorded what kind was submitted to examination. The investigation, in 1834, by Thubeuf (*Journal de Pharmacie*, xx., p. 682), gave as its composition,—a crystalline substance (*Salseparine*, supposed to be identical with *pariglin* of Palotta, *smilacin* of Folchi, and *parallinic acid* of Batka), a colouring matter, a resinous matter, ligneous matter, starch, chloride of potassium, nitrate of potash, fixed aromatic thick oil, and waxy substance. A volatile oil is mentioned in some of the analyses; it probably exists only in young roots, and in the older is converted into resin. Berzelius procured only one ounce from 100 pounds of the root.

The active properties are mostly due to the salseparine the resin, and, when present, to the volatile oil. The more acrid and bitter any specimen of sarza is, the better.

The virtues of sarsaparilla are the subject of much diversity of opinion; many practical men deeming it very useful, while others consider it nearly worthless. This difference seems owing partly to its being employed in different diseases by the one set, from those in which it is used by the other, and still more to inherent differences in the particular root used. It is collected at all seasons of the year, and in all stages of its growth, circumstances which cannot fail to influence its qualities; as young roots gathered before the flower appears must differ greatly from old roots gathered after flowering. But a more important cause of difference exists in the mode of preparing it for administration. The long period enjoined in the 'London and Edinburgh Pharmacopœias' for boiling the root is most injurious, nd in reality the order is never obeyed by any of the chemists or druggists who have obtained a reputation for their preparations. They either use water of a temperature far below that of boiling, or perfectly cold water, as ordered by the Dublin Pharmacopœia, and recommended by all the most eminent Continental pharmaceutists. The powder is not thus injured, but its bulk and taste are obstacles to its full employment. The compound syrup of the latest edition of the American Pharmacopœia is a most excellent form as an addition to some of the watery preparations.

The curative powers of sarsaparilla are often very much heightened by combination either with alkalis, especially lime-water, or in other cases with acids, particularly the nitric. When properly prepared, and administered in suitable cases, no one can doubt the efficacy of sarsaparilla. From the high price of it, and the great consumption of it, attempts have been made in many of the great hospitals to dispense with it or discover a cheaper substitute, but without success. In the worn-out or debilitated systems so common in the patients by whom these establishments are crowded, its utility is daily manifested. This is partly owing to the care taken to procure the best kinds, and partly to the appropriate use made of it, for the sake of economy. It is chiefly used in chronic, syphilitic, rheumatic, gouty, and cutaneous diseases. Its most obvious action is diaphoretic, but if the patient be kept cool, diuretic. In cases where an acid is indicated, the Hemidesmus indicus, which is possessed of a natural acid (hemidesmic acid), will be found a useful substitute for the artificial preparations.

If any European plant ever prove a proper substitute for sarsaparilla, it will be the Tamus communis, or black bryony of our hedges, the root of which, when scraped and applied externally as a poultice, rapidly promotes absorption of effused blood. This is well known to bruisers, gypsies, and others, who to remove ecchymoses of the eye apply a poultice of this root, and generally remove the blackness in twelve or twenty hours. (Tyrrell *On the Eye*, vol. i., p. 200.)

SMILIS. [SCULPTURE.]

SMI'LIUM, Dr. Leach's name for a genus of pedunculated *Cirripeds*, distinguished from *Pentelasmis* by the number of its valves, and from *Scalpellum* by its hairy pedicle. Pieces thirteen, all smooth; ten in pairs, lateral and subtriangular; two anterior dorsal and ventral incurved and triangular; one posterior dorsal and linear; pedicle hairy.

Example, *Smilium Peronii*.

SMITH, SIR THOMAS, was the eldest of the three sons of John Smith, of Saffron Walden, who appears to have been a gentleman of some distinction in the county, since he served the office of high sheriff for Essex and Hertford in 1539. His son Thomas was born at Saffron Walden, on the 28th of March, 1514, or 1515, most probably in the latter year.

In 1526 he was entered of Queen's College, Cambridge, of which he became a fellow in 1531. It is said to have been after this that, incited by the example of Dr. John Redman, who had just returned from the Continent an accomplished Greek scholar, he made himself master of that language in about two years; and the story is commonly told so as to imply that the study of Greek was till now unknown at Cambridge. But this is incredible; and indeed Smith's own relation of the methods he took to reform the prevalent mode of reading Greek at the University shows that some acquaintance with the language, though perhaps not a very exact or profound acquaintance, was previously common among the students. In 1533 he was appointed to read the public Greek lecture; and it was while holding this office that, in conjunction with his friend Cheke, he introduced the improved mode of pronouncing the Greek tongue, of which he has given an account and defence in his tract entitled 'De Recta et Emendata Linguæ Græcæ Pronuntiatione,' first printed in 4to, at Paris, in 1568, and afterwards, along with the 'Disputationes' of Cheke, the 'VII. Epistolæ' of Bishop Gardiner (who espoused the cause of the old pronunciation), and other writings on the same subject, in Henry Stephen's collection entitled 'De Linguæ Græcæ et Latinæ Vera Pronuntiatione Commentarii Doctissimorum Virorum,' 8vo., 1587.

In 1538 Smith, now one of the most distinguished members of the University, was chosen public orator, and for some years he discharged the duties of that office with great applause. But in 1539 he left England, and remained abroad for two or three years, during which time he visited France and Italy, and took his degree of doctor of the civil law at Padua. After his return home, having taken the same degree at Cambridge in 1542, he was appointed king's professor of law in that University; and he seems to have continued to reside at Cambridge during the remainder of the reign of Henry VIII., although he is stated to have taken at least deacon's orders, and to have held in the Church both the rectory of Leverington in Cambridgeshire and the deanery of Carlisle. His father had been long attached to the new doctrines in religion, and he had himself been brought up in the reformed faith from his childhood.

The accession of Edward VI. however was the great turning point in the history of this learned and able man. He was immediately taken into the family of the lord-protector Somerset; and, besides being made one of his masters of requests, was appointed to the two lucrative places of Provost of Eton and Steward of the Stannaries. In addition to his classical erudition, Smith had distinguished himself by his acquirements both in the pure mathematics and in such physical and experimental philosophy as was then known. We have already seen him figuring as a professor of law and as a clergyman: in 1548 he appears in a new professional character, having been that year made secretary of state and knighted. The same year he was sent to Brussels on an embassy to the emperor Charles V. There is some reason to suppose that on the fall of his patron Somerset he lost his place of secretary; but if so, he was soon restored to it; for in April, 1551, he was sent in that capacity on the embassy to Henry II. of France, to treat of a marriage between King Edward and that king's daughter.

When the crown passed to Mary, Sir Thomas Smith was deprived of all his employments and preferments; but having conducted himself with prudence, he was not further molested, and was even allowed a pension of 100*l.* a year. On the accession of Elizabeth, he was immediately restored to his deanery, and he was soon also recalled to public employment. In 1559 he was one of the commissioners sent to France by whom a peace was concluded between the two countries; and being again sent thither in 1562, he continued to reside abroad till 1566. He was also employed on another mission to France in 1567. Then he resided for some years at his seat in the country, till he was recalled to court in 1571; and being admitted of the privy council, was soon after appointed assistant secretary of state under Burleigh. In 1572 he once more went over in a diplomatic capacity to France; and while he was abroad he was nominated by the queen Chancellor of the Order of the Garter. In June that same year, on Burleigh's promotion to the place of lord treasurer, Smith succeeded him as secretary of state; and this office he held till his death on the 12th of August, 1577. He died possessed of considerable landed property, which, as he left no issue, though he was twice married, descended to the family of one of his younger brothers. A natural son whom he had was killed in Ireland in 1573.

Besides his Latin treatise on the pronunciation of Greek, already mentioned, Sir Thomas Smith is the author of another tract, entitled 'De Recta et Emendata Linguæ Anglicæ Scriptione,' printed along with that in 1568. But his most remarkable work is that entitled 'The English Commonwealth,' in three books, first published in 1584, and several times reprinted since; and in a Latin translation executed by himself, forming one of the small volumes of the collection of the 'Respublicæ.' Some shorter performances of his are given in the appendix to his Life by Strype, which also contains accounts of his unprinted writings. [STRYPE, JOHN.]

SMITH, ROBERT, D.D., an English mathematician, who was born in the year 1689: the place of his birth and the manner in which he was educated are not known; but it appears that from his youth he applied himself diligently to the study both of pure mathematics and of the physical sciences. In the early part of his life he was appointed tutor to the duke of Cumberland, and he subsequently received the title of master of mechanics to the king. He was a cousin by his mother's side of the celebrated Roger Cotes, and the two young men were intimately connected by friendship as well as by blood; they pursued their studies in each other's society, and their united labours were directed to the advancement of the Newtonian philosophy in this country. Mr. Cotes, who was Plumian professor of astronomy at Cambridge, dying in 1716, Mr. Smith, then M.A., was immediately afterwards appointed to succeed him: in 1723 he was made LL.D.; and in 1742, on the death of Dr. Bentley, he was appointed master of Trinity College. In 1722 he published, under the title of 'Harmonia Mensurarum,' and with a valuable commentary, several tracts on philosophical subjects which had been written by his relative and friend; and in 1738 he brought out, in two vols. 4to., his great work, entitled 'A Complete System of Optics,' which he dedicated to the Right Hon. Ed. Walpole. Such a work was then much wanted: it contains, besides a full development of the several different branches of the science, a considerable number of applications of the subjects to astronomy and navigation; but it is considered as rather deficient in perspicuity and arrangement. It was translated into French in 1767.

Dr. Smith undertook to correct and publish Cotes's 'Lectures on Hydrostatics and Pneumatics;' and this work, which came out in the year 1737, was enriched with a great number of notes, explanatory and illustrative of the subjects. A second edition of it was published in 1747. In the following year he published in one volume, 8vo., a treatise entitled 'Harmonics, or the Philosophy of Musical Sounds;' and of this work a second edition appeared in 1758. This learned man, of whose life so little is known, was in 1718 admitted a fellow of the Royal Society, and was intimately acquainted with most of the scientific men of his time. He died at Cambridge in 1768, and in the seventy-ninth year of his age, having been a liberal benefactor both to the University and to Trinity College; and having bequeathed two annual prizes, each of 25*l.*, for students who, being bachelors of arts, should have made the greatest progress in mathematics and natural philosophy. The two bachelors who gain these prizes are designated by the name of Smith's prizemen.

SMITH, ADAM, the only child of his parents, was born at Kirkaldy, June 5th, 1723, a few months after the death of his father, who was comptroller of the customs at that place. He was brought up with great tenderness by his surviving parent, and sent to the grammar-school of his native town. From 1737 to 1740 he pursued his studies at the university of Glasgow. Being designed for the Church of England, he left Glasgow, and proceeded as an exhibitioner on Snell's foundation to Baliol College, Oxford, where he spent seven years. Mathematics and natural philosophy, with antient and modern languages, were his favourite studies at this University. Having abandoned the idea of taking orders, he returned to Scotland: and in 1748 went to reside at Edinburgh, where, for the next three years, he read lectures on rhetoric and belles-lettres, under the patronage of Lord Kames. In 1751 he was elected professor of logic in the university of Glasgow; and in the following year was appointed to the chair of moral philosophy, which he filled for the next thirteen years. The third division of his lectures included various subjects, which he subsequently so ably treated in the 'Wealth of Nations.' His talents in the chair have been highly praised, and his lectures were generally delivered extempore. During his residence at Glasgow, he published his 'Theory of Moral Sentiments:' the first edition appeared in 1759; and the sixth, which contains considerable additions, shortly before the author's death. The fundamental principle of this work is, that sympathy forms the foundation of morals; that 'the primary objects of our moral perceptions are the actions of other men; and that our moral judgments with respect to our own conduct are only applications to ourselves of decisions which we have already passed on the conduct of our neighbours.' (Dugald Stewart.) This theory being now little thought of, it is unnecessary to enter into further details. To the second edition of the above work was prefixed a dissertation on the origin of languages, which was afterwards published separately, under the title of 'Considerations concerning the First Formation of Languages, and the Different Genius of Original and Compounded Languages.' It is praised rather for its ingenuity than the soundness of its conclusions. In 1763 Mr. Smith resigned his professorship, in consequence of an invitation to accompany the Duke of Buccleugh on his travels. The university of Glasgow conferred upon him the honorary degree of LL.D., a title which he never assumed in private life. He left London with his noble pupil in January, 1764, and proceeded to Toulouse, where they resided eighteen months. They next visited various parts of the South of France, spent two months at Geneva, and came to Paris at the end of 1765, where they remained ten months; and after an absence of nearly three years, returned to England. At Paris Mr. Smith became intimately acquainted with Turgot, Quesnay, Necker, D'Alembert, Helvetius, Marmontel, and other distinguished persons. Had Quesnay lived, it is said that the 'Wealth of Nations' would have been dedicated to him. Soon after his return to England, Smith proceeded to Kirkaldy, where, with the exception of occasional visits to Edinburgh and London, he resided until 1766, engaged in his great work. He mixed with the best literary society of both capitals, and was on terms of intimate friendship with Hume. When Johnson visited Scotland, he and Smith met, and Johnson rudely attacked the latter on account of his intimacy with the great historian. The interview between them is described in the *Edinburgh Review*, No. 145, p. 51. The 'Wealth of Nations' appeared early in 1766. To the third edition (1784) the author made several additions; but the fourth edition (1789) contained no alterations of any kind. The two following years after the first appearance of the work were spent in London. In 1788, through the influence of the Duke of Buccleugh, Mr. Smith was appointed one of the commissioners of customs for Scotland, on which he removed to Edinburgh, where he spent the remaining thirteen years of his life. When this appointment took place, he was in his fifty-fifth year; and it has frequently been regretted that his time was not devoted to more profitable labours, for though the duties of his office were not onerous, they were sufficient to distract his attention. He had collected materials for publication, which, with the exception of some detached essays published by his executors, were destroyed by his orders a few days before his death, as he had never found time to arrange them for the press. The closing years of his life were spent tranquilly in the society of a small circle of friends, who generally supped with him every Sunday. His mother resided with him until her death in 1784, a loss which he severely felt; and a maiden cousin, who had always superintended his domestic concerns, died four years afterwards. In 1787 he was elected rector of the university of Glasgow. He did not linger long after his domestic bereavements, but died in July, 1790, aged 67. He was never married.

The private character of Adam Smith has been fully given by his friend Dugald Stewart, in the account of his 'Life and Writings,' which is prefixed to more than one edition of the 'Wealth of Nations.' His disposition was amiable and benevolent; his manners artless and simple; and in society he not unfrequently exhibited instances of absence of mind. Dugald Stewart says:—'He was certainly not fitted for the general commerce of the world, or for the business of active life.' His acts of private charity were on a scale much beyond what might have been expected from his fortune. The medallion by Tassie gives an exact idea of his profile and the general expression of his countenance.

The 'Wealth of Nations,' or, to give the title correctly, the 'Inquiry into the Nature and Causes of the Wealth of Nations,' is the work on which the fame of Adam Smith will permanently rest. It overthrew the errors of the mercantile theory, that money was wealth; that of the agricultural theory, that land was the only source of wealth; and established the principle that the true source of wealth was labour. Hobbes, in 1651 ('Leviathan,' chap. 24), had briefly glanced at the importance of labour in conferring value upon things; Locke, in 1[illegible] ('Essay on Civil Government'), went further, but was evidently not fully aware of the importance of the principle which he elucidated. Mr. McCulloch, in his 'History of the Rise and Progress of the Science of Political Economy up to the publication of the Wealth of Nations,' thus sums up what Adam Smith has done for the science:—'In the "Wealth of Nations" (he says) the science was, for the first time, treated in its fullest extent; and the fundamental principles on which the production of wealth depends, were established beyond the reach of cavil and dispute. In opposition to the French economists, Dr. Smith has shown that *labour* is the only source of wealth, and that the wish to augment our fortunes and to rise in the world is the cause of wealth being saved and accumulated. He has shown that labour is productive of wealth when employed in manufactures and commerce, as well as when it is employed in the cultivation of the land. He has traced the various means by which labour may be rendered more effective; and has given a most admirable analysis and exposition of the prodigious addition made to its powers by its division among different individuals, and by the employment of accumulated wealth, or capital, in industrious undertakings. Dr. Smith has also shown, in opposition to the commonly received opinions of the merchants, politicians, and statesmen of his time, that wealth does not consist in the abundance of gold and silver, but in the abundance of the various necessaries, conveniences, and enjoyments of life. He has shown that it is in every case sound policy to leave individuals to pursue their own interest in their own way; and that, in prosecuting branches of industry advantageous to themselves, they necessarily prosecute such as are at the same time advantageous to the public. He has shown at great length, and with a force of reasoning and amplitude of illustration that leaves nothing to be desired, that the principles of the mercantile or exclusive system are at once inconsistent and absurd; and that every regulation intended to force industry into particular channels, or to determine the species of commercial intercourse to be carried on between different parts of the same country, or between distant and independent countries, is impolitic and pernicious—injurious to the rights of individuals—and adverse to the progress of real opulence and lasting prosperity.'

Adam Smith's errors lean towards the theories of the French economists. Some principles he overlooked; others he did not duly appreciate. Many of the theories which he controverted have now become obsolete, yet the manner in which he has investigated them will always please and instruct. Still it is not safe for the student to read him without a guide. The best edition of the 'Wealth of Nations' is that by Mr. McCulloch, either in 4 vols. 8vo. or 1 vol. 8vo.: it contains useful foot-notes, and at the end several original dissertations on subjects which were not so well understood half a century ago.

The 'Wealth of Nations' is divided into five books; but the arrangement of the subject is not on the whole considered judicious. In the first and second books the circumstances which determine the price of commodities, the rate of wages and profits, and the rent of land are discussed. The third book treats of the probable progress of a country in which individual and national industry were unimpeded by restrictions, and shows the 'natural progress of opulence.' The causes which had produced the then existing policy of different European countries are pointed out. In the fourth book the mercantile and agricultural systems are examined. The fifth book relates to revenues of the state, the principles of taxation, and the effect of national debts. There are several long digressions on various branches of the subject.

SMITH, JOHN STAFFORD, a composer of great eminence, was born about the year 1750, in Gloucester, of which cathedral his father was organist, and by whom he was prepared for his final instructions in music under Dr. Boyce. At an early age he was appointed one of the Gentlemen of the Chapel-Royal; and on the decease of Dr. Arnold, in 1802, became organist of the same. In 1805 Dr. Ayrton resigned to him the mastership of the Children of the Chapel, an office which he relinquished in 1817, when he withdrew from all his professional engagements, and enjoyed a moderate but well-earned independence till his death, which took place in 1836.

At the age of twenty-three Mr. Smith gained a prize-medal from the Catch-Club, for a composition which had nothing to recommend it but that kind of grossness so much admired in 'the good old times;' but the following year produced his fine glee for four voices, 'Let happy lovers fly where pleasures call,' on which a similar medal was much more properly bestowed. The same honour was with equal discrimination conferred, in the three succeeding years, on his glees, 'Blest pair of Syrens,' 'While fools their time in stormy strife employ,' and 'Return, blest days.' He obtained in the whole eight of these honourable distinctions; but his very delightful glees, 'Let us, my Lesbia, live and love,' and, 'As on a Summer's day,' missed the reward due to their merits. Mr. Smith was also author of a madrigal, 'Flora now calleth forth each flower,' a work which may compete with anything of the kind extant. He published, between the years 1777 and 1785, five collections of glees, a volume of anthems, *Musica Antiqua*, and *Antient Songs of the Fifteenth Century*, the two last of which bear indisputable evidence of his industry and research, and now form a part of every good musical library.

SMITH, JOHN RAPHAEL, son of a respectable landscape-painter, who, from the place of his residence, is commonly known as Smith of Derby, was born about the middle of the last century. His father, Thomas Smith, has been stated to be one of the first artists 'who explored and displayed the charming scenery of his native country.' Several of his pictures were engraved by Vivares. Bryan states that he died in 1769. He intended to make an artist of his eldest son Thomas, who had given early indications of inclination towards painting, and apprenticed the subject of this notice to a linen-draper. Time however proved that he was mistaken in his selection, for Thomas never advanced beyond mediocrity, while John Raphael forsook the counter, and became eminent as a mezzotinto engraver and also as a painter. Very little is recorded of his history, and the few circumstances which are narrated are conflicting. It appears however that he was in full practice as an artist in London about 1778. He executed many beautiful engravings from pictures by Sir Joshua Reynolds, and several from his own. Among the latter are whole-length portraits of Charles James Fox and Earl Stanhope. Latterly Smith devoted himself chiefly to the production of slight crayon portraits, which he executed with great facility. Dayes, a contemporary artist, observes, 'The number of slight heads he has painted at a guinea are incalculable; one of the family told me he had done as many in one week as brought him forty pounds, and each of them I know he could finish in an hour.' While residing in London, he became a publisher and printseller; but during the latter years of his life he travelled about the country a good deal as a portrait-painter. He died in March, 1812, in his sixtieth year, according to a brief notice of his life and works in vol. iv. of the 'Library of the Fine Arts,' or in 1811, according to Bryan, and was buried at Doncaster. Unhappily his habits and character were not such as to excite respect. He was much given to low sports and practices; even pugilism has been mentioned among the debasing amusements to which he was addicted. With a taste for such pursuits, it is not surprising to find him on intimate terms with Morland, whom he assisted in bringing into notice.

SMITH, SIR JAMES EDWARD, celebrated as the purchaser of the collections and library of Linnæus, and founder of the Linnean Society, was born at Norwich, on the 2nd December, 1759. He is described as having extreme mental susceptibility, and a delicate constitution, whence he was much under the care of his mother; from whom he imbibed his taste for flowers. His father was a man of cultivated mind, and had no doubt considerable influence in forming his son's mind, especially as his education was domestic, with the assistance of masters from Norwich. This town has long been remarkable for the fondness of its inhabitants for flowers, introduced, it is believed, by the Flemish weavers, who took refuge in England from the tyranny of the Spaniards in their own country. Hence it has probably happened that botany has been a favourite pursuit in Norwich, and that so many botanists have been produced there, as may be seen in Smith's 'Biographical Notice of Norwich Botanists,' as well as in some of our living botanists. Mr. Smith was intended for some mercantile calling, but from his love of science was induced to study medicine, for which purpose he proceeded to Edinburgh in 1781, and obtained in 1782 Dr. Hope's gold medal for the best botanical collection. After his arrival in London, he happened to be breakfasting with Sir Joseph Banks, from whom he learnt that the whole of the collection of books, manuscripts, and natural history of Linnæus had been offered him for one thousand guineas, but that he intended to decline it. The young student of medicine determined upon becoming himself the purchaser, though without funds for the purpose. His father, though at first refusing, afterwards consented to the purchase. The collection arrived here in twenty-six cases, in 1784, and cost 1088*l.* 5*s.* The ship conveying it had just sailed when the king of Sweden, Gustavus III., who had been absent in France, returned home, and sent a vessel to the Sound to intercept its voyage, but happily it was too late. On the death of Sir James, this celebrated collection was purchased by the Linnean Society, and forms a part of their valuable stores of natural history.

A number of circumstances appear thus to have determined the future course of Sir James's life. Though he took up his residence in London, with the intention of practising his profession, it seems never to have seriously occupied his attention. Two years after he became possessed of the collections of Linnæus, he made a tour through Holland, France, Italy, and Switzerland, of which he published an account. He obtained his medical degree at Leyden. In the year 1788, with the assistance of Sir Joseph Banks, Dr. Goodenough (Bishop of Carlisle), and some others, the Linnean Society was founded, and Dr. Smith elected its first president. In 1792 he was employed to teach botany to Queen Charlotte and to the princesses. He continued to reside in London until 1796, when he removed to Norwich, but paid a yearly visit of two months to London, when he gave a course of lectures on botany at the Royal Institution. On the 28th July, 1814, Dr. Smith was knighted by the prince regent at a levee, when he presented a copy of the 'Transactions' of the Linnean Society. The honour was conferred on him as institutor and president of the Society. In the year 1818 Sir James became a candidate for the chair of botany at Cambridge, but not being a member of the University, nor of the Church of England, he was not considered eligible by the authorities of the University. His health began to decline five or six years previous to his death, which took place on the 17th March, 1828.

The public will be chiefly interested in his works. Of these a full list is given in the Memoir of his Life and Correspondence, published by his widow. These are numerous, but those by which he will be principally known and remembered are, 'English Botany,' in thirty-six volumes, with 2592 coloured figures by Mr. Sowerby; 'The Latin Flora Britannica,' three volumes, and especially 'The English Flora,' in four volumes; also 'Flora Græca,' from Dr. Sibthorp's materials, and the 'Prodromus Floræ Græcæ.' He was also author of the botanical articles and of the botanical biography in Rees's 'Cyclopædia,' from the letter C, which have always been much valued, and of numerous papers in the 'Transactions' of the Linnean Society.

Sir James Smith was moreover esteemed as a man of a kind heart, amiable dispositions, and pure moral habits. His correspondence displays great warmth of friendship towards him on the part of numerous distinguished individuals. His purchase of the Linnean collections, and his devotion to the science of botany for so many years, had considerable influence in spreading a taste for and in extending the cultivation of that science. In his exclusive attachment to the artificial classification of Linnæus in preference to the natural method, in favour of which Linnæus has expressed himself in the strongest terms, he preferred that which was valuable for a time, to that which, as perfected, becomes fitted for all times.

SMITH, ANKER, who received his unusual name by way of fanciful allusion to his being an only son, the *hope* of his parents (*anker* being an old way of spelling anchor), was born in London in 1759. He was educated in the Merchant Taylors' School, and was articled, in 1777, to his uncle, Mr. John Hoole, a solicitor. The unusual neatness of his writing led Mr. Hoole to try his skill at drawing with a pen. He therefore copied two line engravings in pen and ink; and so admirably was the second executed, that James Heath is said to have mistaken it for a print. In consequence of this indication of talent, young Smith was articled to an engraver named Taylor, in the year 1779, but he quitted him in 1782, by which time he had surpassed his instructor. He then became an assistant of James Heath, in whose name he executed many works, among others, the Apotheosis of Handel, which is said to be entirely his own. About the year 1787 Smith received his first independent employment as an engraver, being then engaged upon the plates to illustrate Bell's edition of the 'British Poets.' About the same time he was introduced by Hoole, the translator of Tasso (who was brother to the gentleman of that name before alluded to), to Alderman Boydell, by whom he was commissioned to engrave Northcote's picture of the Death of Wat Tyler. For this engraving he was, in 1797, elected an associate of the Royal Academy.

The engravings of Anker Smith are much esteemed for their beautiful execution and correct drawing; although, from the circumstance of his working much for book publishers, his name is less known than it deserves to be. His private character was unimpeachable; and his modesty, piety, and correct judgment secured him many friends. In 1791 he married. He died of apoplexy, in June, 1819, leaving his widow, four sons, and a daughter. Of his sons, the second, named Frederick William, who became a pupil of Chantrey, gave great promise of eminence in the art of sculpture, but died in 1835, at the age of thirty-eight years; and the two younger, who still survive, have embraced that of painting. Mr. Smith had several sisters, one of whom was mother to W. C. Ross, Esq., miniature-painter to her present majesty.

SMITH, JOHN THOMAS, for many years keeper of the prints and drawings in the British Museum, was the son of Nathaniel Smith, formerly a sculptor, and afterwards a well-known printseller in Great May's Buildings, St. Martin's Lane. Nathaniel Smith had been when young the playfellow of Nollekens; and they had learned drawing together. In August, 1755, Smith was placed with Roubiliac, the sculptor; and about 1759 and 1760 he and Nollekens, who had become a pupil of Scheemakers in 1750, obtained some of the best prizes of the Society of Arts. Nathaniel Smith, who gained many prizes from the Society, carved three of the heads of the river-gods which adorn the arches of Somerset House, from designs by Cipriani. The friendship existing between him and Nollekens occasioned the subject of this article, who was born on the 23rd of June, 1766, to be very early noticed by the eccentric sculptor, who, while he was yet a boy, used to take him to see various parts of London, pointing out curious vestiges of antiquity, and thus probably exciting that peculiar taste by which Smith was subsequently rendered eminent. His mother dying in 1779, young Smith was invited to the studio of Nollekens, to whom his father was then chief assistant. After enjoying this privilege for three years, during which time he had much practice in drawing, he became a student at the Royal Academy. About this time he made pen-drawings in imitation of the etchings of Rembrandt and Ostade, and these, through the introduction of Dr. Hinchliffe, then bishop of Peterborough, obtained a liberal offer from Sherwin, in consequence of which Smith became a pupil of that skilful engraver. For some years after being with him, Smith was chiefly engaged as a drawing-master.

He married at the age of twenty-two years, and soon afterwards commenced the publication, in numbers, of his first work, the 'Antiquities of London and its Environs,' a collection of representations of houses, monuments, statues, and other interesting remnants of antiquity; unaccompanied by letter-press descriptions, but having short accounts, with references to Pennant and other writers, engraved under each subject. This work was commenced in January, 1791, and completed in 1800; the whole series consisting of ninety-six plates of a quarto size. A complete list of the subjects is given in Upcott's 'Bibliographical Account of the Principal Works relating to English Topography,' vol. ii. p. 886. While this was in course of publication, Smith brought out his 'Remarks on Rural Scenery,' a thin quarto volume, illustrated with twenty etchings of cottages, some of which are very prettily executed.

Smith's next work for the illustration of the early architecture of the metropolis was his 'Antiquities of Westminster,' comprising the old Palace, St. Stephen's Chapel, &c., and containing engravings of 246 topographical objects, of which, at the time of its publication (1807), 122 were no longer in existence. This series of engravings is comprised in 38 plates and six wood-cuts, of which a particular account is given by Upcott, vol. ii., p. 835, *et seq.* 'This task,' it is observed by Mr. Smith's biographer, in the 'Gentleman's Magazine,' 'appears to have been determined on in the year 1800; when, on occasion of the Union with Ireland, it becoming necessary to remove the wainscoting for the enlargement of the House of Commons, some very curious paintings were discovered, on the 11th of August.' 'The next day,' the narrative proceeds to inform us, 'Dr. Charles Gower and Mr. Smith visited the paintings. Mr. Smith immediately determined to publish engravings from them, and, permission being obtained, on the 14th he commenced his drawings. It was his custom to go there as soon as it was light, and to work till nine o'clock in the morning, when he was obliged to give way to the workmen, who often followed him so close in their operations as to remove in the course of the same day on which he had made his drawing the painting which he had been employed in copying that very morning.' Antiquaries will long esteem the name of John Thomas Smith, were it only for the service he rendered in snatching these curious paintings from complete oblivion. The plates of the 'Antiquities of Westminster,' which comprise coloured copies of several of these paintings, are accompanied by descriptions of considerable length, a great part of which were written by J. Sidney Hawkins, F.S.A.; although, owing to a misunderstanding which led to the publication of much angry correspondence, portions of which are often bound up with the work, it was completed by Smith alone. A disastrous fire at Bensley's printing-office destroyed 400 copies of this work, and 300 prints, occasioning a loss to Mr. Smith which he estimated at 3000*l.* In 1809 appeared sixty-two additional plates to the above work, forming a second volume, but without any description, or even a list of subjects. The latter however has been supplied by Mr. Upcott, in the work above alluded to, vol. ii., p. 839, &c.

These works were followed by another, in imperial 4to., entitled 'Ancient Topography of London,' the publication of which was commenced in October, 1810, although it was not completed until 1815. This, which is considered Smith's best work, contains 32 plates, very boldly etched, in a style somewhat resembling that of Piranesi, and accompanied by descriptions of the buildings represented. The author intended to extend it somewhat further, but never did so. In 1816 Mr. Smith received his appointment as keeper of the prints in the British Museum; and in the next year published his 'Vagabondiana, or Anecdotes of Mendicant Wanderers through the Streets of London,' illustrated with about thirty portraits, and with an introduction by Mr. Douce.

The last literary production of Mr. Smith was the amusing but not very honourable or trustworthy book entitled 'Nollekens and his Times,' which appeared in 1828, and soon ran through three editions. Smith was an executor to Nollekens, and was disappointed in not being a legatee. He therefore wrote under the influence of excited feelings, and made a discreditable use of the free access he had for so many years enjoyed to the home and studio of Nollekens. Still, although the work contains much that should not have been published, and is distinguished by a degree of high colouring which greatly impairs its veracity, it contains many curious anecdotes of artists and other distinguished men with whom Smith had come in contact in the course of a long and rather eventful life. He left in manuscript materials for a history of his own life and times, which has not yet been published. He had also collected much matter towards an account of the parish of St. Paul, Covent Garden, and for a work which he intended to call 'Walks through London;' but he did not live to complete any of these works, having died of inflammation of the lungs, after only a week's illness, March 9th, 1832, in his 67th year. His wife, a son, and two daughters survived him. Mr. Smith is stated to have been of kind disposition, and inclined to encourage young artists. In his attention to the duties of his office he was exemplary; and his fund of anecdote rendered him a very amusing companion. There is a portrait of him engraved by Skelton, from a drawing by Jackson. (*Gent. Mag.*, vol. 102, part i., p. 641, &c.)

SMITH, WILLIAM, LL.D., author of the first geological map of England and Wales, born 23rd March, 1769, at Churchill, in Oxfordshire, died 28th August, 1839, at Northampton, where a tablet is intended to be erected by subscription to his memory.

The life of this distinguished ornament of English geology is full of events which illustrate the power of a vigorous intellect and patient disposition in conquering the difficulties which sometimes impede the prosecution of science; but we propose in this brief notice merely to state a few of the circumstances which justify his admitted claim to be entitled 'Father of English geology.'

Previous to the year 1791, Mr. Smith had made observations on the various sorts of land, as depending on different kinds of rocks; had compared, for example, the red marls and lias of Warwickshire with the oolitic soils and strata of Gloucestershire; but in 1791, being employed to make careful surveys of collieries and mines in Somersetshire, he found, on descending the pits and comparing the underground sections with the surface features, evidence of a 'regularity in the order of superposition' of strata, much more extensive and practically and analytically demonstrated than was ever stated or admitted before. Reflecting on this circumstance, he resolved to examine if the strata thus regularly superposed were equally or approximately consistent in the limited district of Somersetshire and the bordering counties, in which his labours were then confined. He found by abundant investigation and levellings in separate valleys, that generally the edges of the strata above the coal were continuous on the surface, their plane surfaces declining into the earth in one direction, viz. toward the east or south-east; but that the strata of coal lying beneath the red marl were not 'conformed' in their inclination to the rocks above. This 'unconformity' he represented by a large working section of Pucklechurch colliery in Gloucestershire.

In his investigations, which, as engineer to the Somerset Coal Canal, he made for the purpose of setting out the line and letting the works, it became difficult always to recognise and discriminate the rocks which were to be cut through, on account of the great mineral resemblance between some of these and their accidentally displaced portions. Searching for marks to aid these distinctions, Mr. Smith was quickly led to perceive the constancy with which certain groups of organic remains accompanied only particular layers or strata. By collecting these fossils, and placing them in relative order, as they were found lying in the earth, he was soon able by their aid to 'identify' the strata near Bath; to declare, regarding all these stratified rocks that they had each formed 'successively the bed of the sea, and contained each the remains of the creatures which then lived and died. These remains were different in different strata, because at successive times the forms of life had changed, and because of the influence on life of the different mineral constitution of the sea's bed; but they were generally identical in distant parts of the same strata.

With these ideas clearly established, Mr. Smith, in 1794, was enabled, by one long journey through great part of England and Wales, to generalise the propositions, and to contemplate, as an obvious consequence of such views, a 'Geological Map of England and Wales,' and a 'Table of Superposition of the Strata.' This table was drawn up in 1799; a map on a small scale was coloured in 1801; and the author promised in that year a valuable volume to accompany documents so new and important. The originals of these documents are fortunately preserved. It would be painful to speak of the discouragements and difficulties which Mr. Smith had to overcome before, in 1815, on a large and handsome scale, appeared the 'Delineation of the Strata of England and Wales,' with an interesting memoir. These difficulties were often generated by his own unmeasured zeal in prosecuting his favourite science. To it all the considerable profits of a successful profession were freely devoted; and not even in later years, when he had to suffer the consequences of such devotion, was he ever known to regret this improvident profusion.

After giving to the world 21 geologically-coloured maps of English counties, many valuable sections, and two unfinished volumes on Organic Remains, Mr. Smith was for many years lost to science till drawn from his retirement by the Geological Society of London, which, in 1831, awarded to him the first medal placed at their disposal by the bequest of Wollaston, 'in consideration of his being a great original discoverer in English geology; and especially for his being the first, in this country, to discover and to teach the identification of strata, and to determine their succession by means of their imbedded fossils.'

In 1835 he received the degree of LL.D. in Trinity College, Dublin, and during a few years he enjoyed a pension of 100*l.* At his death, a vast mass of unpublished papers, many of which are of uncommon merit and bear on practical applications of geology, constituted his whole property. (Fitton, in *Edinb. Review* for 1817; Sedgwick, *Address to Geol. Soc.*, 1831; *Magaz. of Nat. History*, 1839.)

SMITH. Several English artists of this name may be briefly mentioned. John Smith, a contemporary of Kneller, after whom he engraved many portraits, was by far the best mezzotinto engraver of his time. His works are very numerous, and comprise not only portraits, but historical and miscellaneous subjects also. The 'Biog. Univ.,' without referring to any English authority, gives 1654 as the date of his birth, and 1719 as that of his death; and several other works state that he died in 1720. The writer has however seen a print with his name, bearing the date 1721. From Dallaway's edition of Vertue's 'Catalogue of Engravers,' it would appear that there were two engravers of this name, father and son; but this statement rests, as far as we know, on no other authority. A note in the work referred to mentions a collection of 574 engravings by those artists. Of the more eminent John Smith (if there were really two) there is a portrait by Kneller. Strutt mentions an indifferent portrait engraver named Jacob Smith, who was living in 1736, and executed portraits of Sir Isaac Newton and Sir Hans Sloane, each of which consisted of a single spiral line; and Gabriel Smith, who died in 1783, and excelled in the chalk style of engraving. He lived for some time in Paris, but was a native of London, where, according to the 'Biog. Univ.,' he was born in 1724. Samuel Smith, a landscape engraver, surpassed by few, if by any, lived in the latter half of the eighteenth century. He engraved a beautiful plate of Wilson's 'Niobe,' which is now in the National Gallery; the figures were put in by Sharpe. He also did the landscape to Sharpe's 'Holy Family,' after Sir Joshua Reynolds, and some engravings from Loutherbourg. As he worked much for other engravers, his name is comparatively unknown. We have been unable to find the date of his birth or death, and know nothing of his history excepting that he never married. William Smith, born 1707, died 1764; George Smith, born 1714, died 1776; and John Smith, born 1717, died 1764, were three brothers, natives, it is commonly stated, of Chichester, although Pilkington mentions Guildford instead of that place. The first painted chiefly portraits, and the others principally landscape. Although apparently self-taught, they attained a respectable standing in their profession.

SMITH, JOHN. [Virginia.]

SMITHIA, a genus of plants of the natural family of Leguminosæ, named in memory of Sir James Smith, founder and long president of the Linnean Society.

The genus Smithia consists of small plants with inconspicuous flowers, but the leaves are remarkable for their apparent sensibility on being touched, in which they resemble the sensitive plant. The genus is nearly allied to Æschynomene and to Lourea. The calyx is bipartite, the corol papilionaceous, the stamens in two equal bundles, the legume transversely articulated, plicate, and enclosed within the calyx. The species are found in warm parts of the world, as in New Holland and the plains of India, in the rainy season. As the periodical rains extend also to the Himalayan Mountains, and produce considerable uniformity of temperature and moisture, so a delicate Smithia is found at considerable elevations, as S. ciliata, figured by Dr. Royle in his 'Illustr. of Himalayan Botany,' from the lofty Mountain of Kedarkanta.

SMITHFIELD. [London.]

SMOKE, the vapour arising from substances in a state of combustion. In its more extended sense the word smoke is applied to all the volatile products of combustion, which consist of gaseous exhalations charged with minute portions of carbonaceous matter, or soot; but, as often used in reference to what are called smoke-consuming furnaces, the term is frequently employed to express merely the carbonaceous matter which is held in suspension by the gases. It is important to bear this distinction in mind, as it involves a fact which appears to have been sometimes overlooked, namely, that however completely the soot may be destroyed, and the smoke be thereby rendered invisible, it still remains necessary to provide means of free exit for the deleterious gaseous matter which is evolved from the burning fuel.

The matters to be noticed under this head resolve themselves into two classes—such as effect the removal of smoke, especially from open fire-places; and such as bear upon the purification of smoke, either by consuming the carbonaceous matter, or by separating it from the more volatile gases.

Removal of Smoke; Cure of Smoky Chimneys.—The action of an ordinary chimney in conveying the smoke from a fire situated at its lower extremity is very simple. The air in the chimney, being rarefied by the heat, becomes lighter in proportion to its bulk than the surrounding atmosphere, and therefore rises, its place being supplied by fresh air forced in at the lower end by the pressure of the comparatively heavy cold air outside the chimney. A constant rising current is thus created, the force of which is sufficient to carry up with it any light bodies, such as the particles of soot which escape from the fire. The intensity of this current, or in ordinary language, the strength of the draught, depends much upon the height of the chimney; for it is evident that the higher a chimney is, within reasonable limits, the greater must be the difference between the weight of the column of hot air which it contains, and that of a column of cold air of equal elevation; and that the force with which the cold air enters the bottom of the chimney will be proportionate to the amount of such difference. It is also evident that the hotter the air in the chimney is kept, the more rapidly it will rise, and that it is therefore advisable to build chimneys in warm and sheltered situations, and to construct them of materials which will not readily part with the heat they may acquire. Hence chimneys act better when built in stacks, or when in the interior of a house, than when single, or when outside the walls, and it is especially desirable to avoid erecting them in situations exposed to cold north winds.

The circumstances which impede the proper action of chimneys, and occasion the annoyance of smoke in houses warmed by common open stoves, have excited the attention of many individuals, and form the subject of several treatises. Franklin analysed the subject very judiciously, and published a pamphlet, entitled 'Observations on the Causes and Cure of Smoky Chimneys,' in which he enumerated nine different causes, and suggested means for the cure of each. This little work, from which most of the following remarks are condensed, was originally printed in Philadelphia, but has been republished in England. The causes, with the remedies recommended by Dr. Franklin, are as follow:—

1. The want of a free supply of air to the bottom of the chimney. It is of little consequence how spacious the room may be into which the chimney opens, if the access of fresh air to the room be cut off. As the hot air escapes from the top of the chimney, its place must be filled by fresh air taken from the room. But if the entrance of the external atmosphere be prevented, every chimney-full of air abstracted from the room lessens the density of what remains, so that the draught will decrease until the air in the chimney and that in the room are of equal density, when it will cease altogether, and the smoke will no longer ascend. The case here supposed—that of the *entire* exclusion of fresh air from the room, never occurs in practice; but the same results are produced in a less degree wherever the means of access for the external air are insufficient for the supply of the chimney—a circumstance of frequent occurrence in new houses, where the carpenter's work is true and close. This inconvenience can only be remedied by providing openings for air commensurate to the demands of the fire. The area of the openings required for this purpose may be ascertained by opening a door or window just so far as to enable the smoke to pass off freely; and their situation should be chosen with reference to the comfort of the inmates, so as to avoid as far as possible any current of cold air passing through the room. Whenever it is practicable, the best situation for them is near the top of the room, and over the fire-place; because the entering air is then warmed by the warm air which rises to the top of the room, and becomes pretty generally diffused. In building new houses such an arrangement may be readily effected, and the air-passages may be conducted by the sides and back of the fire-place, so as to warm the air previous to entering the room. In other cases the object may be attained by leaving a window a little open at the top, or by long narrow openings above the window or immediately beneath the cornice. In either case Franklin recommends the fixing of a little inclined shelf just below the opening, to conceal it from view, and to direct the air towards the ceiling. Another plan occasionally resorted to is the use of a pane of glass in the window, hinged to the frame at its lower edge, and capable of being opened more or less as required; wings or side-pieces of glass being added to prevent the air from entering sideways. Sometimes, in lieu of one pane of glass, a number of strips of plate-glass, so arranged as to resemble a Venetian blind, are used; these being so placed as to throw the air upwards, by which means also the risk of rain beating in is avoided. The common ventilator, or *whirligig*, answers the same purpose, and diffuses the air in some degree by its rapid revolution, which is occasioned by the action of the current upon its inclined vanes; but it has the disadvantage of being unsightly, and also that of making a noise. It has been proposed to supply a chimney with air by passages opening immediately into its lower extremity; but any such arrangement, by diminishing the rush of air from the apartment, destroys the best safeguard against the entrance of smoke into the room.

2. Many chimneys smoke because the opening at the lower end is too large. The size of the opening should be proportioned to the height of the chimney; for while a small opening to a tall chimney increases the draught to an improper degree, and causes a wasteful consumption of fuel, a large opening to a short funnel will allow the smoke to escape into the room; because all the air required by the chimney may enter at one side of the opening, leaving the other side free from current, and therefore allowing the smoke to puff out. In such a case the draught is weakened by the coldness of the air which enters the chimney at such a distance from the fire as to be very little affected by it. This defect must be remedied by contracting the opening, and the necessary degree of contraction may be ascertained by covering the top or sides of the opening with boards until the smoke ceases to enter the room. Stoves are now made in such a form that a contracted opening is not necessarily mean in its appearance; the marble top and sides of the fire-place being of handsome dimensions, while the opening is contracted by ornamental iron-work. This fault in construction is still very common.

3. The third cause of defective action mentioned by Dr. Franklin is the funnel or chimney being too short. The same effect is produced when, as in some ill-contrived houses, the flue from an upper story is turned into one from a lower room; for in such a case, when a fire is burnt in the upper stove, the only available length of chimney, as far as draught is concerned, is that between the point of junction and the top of the funnel, because there is free access for air at the point of junction, from the lower part of the main flue. In like manner the length of the main flue can only be counted from the bottom to the point where the collateral chimney joins it, and brings in a supply of air. The inconvenience of such an arrangement may be somewhat diminished by a contrivance for closing the collateral flue when not in use. The shortness of a chimney may sometimes be rendered harmless by contracting the entrance, so that all the air entering it shall be highly heated, by passing immediately over the fire; but for kitchen chimneys, where large openings are indispensable, our author recommends the erection of two additional funnels, one on each side of the original one; each funnel having a distinct opening of moderate size, and those at the sides being provided with slides, so that one or both might be closed when not in use. One advantage claimed for this plan is, that the stack of three chimneys may be safely carried up to a greater height than a single funnel could be.

4. Different chimneys in the same house occasionally overpower each other. If we suppose two stoves, each having a distinct chimney, in a room without a sufficient supply of air from without, we may conceive that one fire

becoming stronger than the other, may overpower it, and obtain a supply of air down the chimney of weakest draught; the descending current of course blowing the smoke of the weaker flue into the room. Precisely the same effect will take place if the stoves are in different rooms, provided their be, owing to the opening of the doors, a communication between them. This will account for the common case of a parlour chimney smoking whenever the room-door is opened, although it may act properly when the room is closed, and thereby cut off from the effect of the kitchen chimney. The proper cure for this is the same as for the first-mentioned cause of smoking. If every room have a free supply of air from without, there will cease to be any probability of the chimney of one apartment overpowering that of another.

5. The next cause of failure in the action of a chimney arises from the situation of the house. If a house stand under the brow of a hill, or in the vicinity of a much higher building, the wind, passing over the higher obstacle, appears to beat down into the chimneys of the sheltered house, and so to prevent the exit of smoke. This may sometimes be remedied by raising the chimney, and in other cases by means of a cowl, or turning-cap, the opening of which always turns from the wind. The ordinary cowl is turned by means of a vane attached to its upper part; but one patented in 1831 by Mr Pollard is turned by wheels set in motion by the action of the wind upon the oblique vanes of a rotatory flyer; the apparatus resembling that used on a large scale for turning the upper part of a tower windmill. In the 'Mechanic's Magazine,' vol. xxiv., p. 121, is a description of a cowl in which the end opposed to the wind is not solid, but concave or funnel-shaped, and terminating in a small pipe. By this arrangement the wind passes through the centre of the cowl, and is supposed to assist in carrying away the smoke. The plan is stated to have proved successful in some cases that had been deemed incurable. Many other contrivances for the same purpose have been used, but only one other will be adverted to here. It consists of a square box placed on the top of the chimney, each side of which consists of a door, hinged at one edge, and connected, by means of an iron rod, with the door on the opposite side of the box or cowl, in such a way that when one door is closed by the force of the wind, the opposite one opens, and allows the smoke to escape. This simple apparatus, which is stated to be in common use at Glasgow, is described and represented in Hebert's 'Engineer's and Mechanic's Encyclopædia,' vol. i., p. 367. Franklin recommends, when a house is built in the immediate vicinity of a hill that is likely to produce the effect above described, that the doors should be made in the side nearest the hill, in order that the wind entering them may counterbalance the pressure in the chimneys, and so lessen its injurious effect.

6. Chimneys occasionally smoke from a cause just the reverse of that last described. This occurs when the chimneys are low, and stand between the wind and a high building, or neighbouring edifice, so that the air is dammed up, as it were, round about them. This case appears to be a very difficult one to deal with; for, owing to the pressure of the atmosphere resisting the escape of the smoke in every direction, cowls are of very little use. Raising the chimneys appears to be almost the only alternative.

7. Another cause of smoking is the injudicious arrangement of the door or doors of a room. If the door be on the same side as the fire-place, and occasion it to smoke by sending a current across the front of the stove, either it must be altered so as to open in the opposite direction, or a screen must be used between it and the stove.

8. Smoke is sometimes blown down a chimney which is out of use. This arises from the circumstance that a stack of chimneys usually maintains a more uniform temperature than the surrounding air. So long as their temperature exceeds that of the external atmosphere, though it may be in a very trifling degree, there is an *upward* current through them; but when, as in the middle of the day, the air generally becomes warmer than that in the chimneys, the current moves *downward*, carrying with it smoke that may happen to be passing over, or escaping from a neighbouring flue. A plate or register, closing the bottom of the chimney when out of use, obviates this inconvenience. It is also very useful in affording ready means of regulating the draught of the chimney, and thereby economising fuel, and avoiding unnecessary currents of air through the room.

9. Lastly, chimneys which under ordinary circumstances perform very well, occasionally smoke in consequence of the passage of a strong wind over them, which the force of the rising vapour is insufficient to cope with. Franklin states that in Venice it was customary to make the top of the flue funnel-shaped, with a view to facilitate the escape of the smoke under such circumstances; but that where he lived a different practice prevailed,—that of reducing the opening at the top to a long narrow slit. Probably a cowl might be of use in such a case.

Although Franklin states that he found smoke generally tractable, when dealt with in a proper way, and that he could make it escape in almost any direction he chose, he met with some very puzzling cases. In one instance where a chimney resisted all appliances, it was discovered that, owing to the irregular settlement of the brickwork, it had a large fissure which admitted the cold air. In another case a chimney on which several experiments had been tried, proved to be choked up by the building of birds' nests. Similar instances still occasionally baffle the *smoke-doctor;* but most smoky chimneys may be accounted for by one of the above causes, and remedied by the means suggested.

Consumption or Purification of Smoke.—The nuisance occasioned by the smoke of coal-fires has formed a subject of complaint from the earliest times in which mineral fuel was extensively used; and the great increase of steam-engine and other furnaces, consequent on the extension of manufactures, has afforded, of late years, additional ground for attempts to abate the nuisance. Such attempts are important, not only for the purification of the air, but also for the economy of fuel; since the matter which gives smoke objectionable density and colour is unconsumed fuel in a finely divided state. It appears therefore that if a supply of air could be thrown into a fire in such a way as to occasion the combustion of the carbonaceous matter, the result would be that a greater amount of heat would be obtained from a given quantity of fuel, at the same time that the nuisance of smoke would be abated. But while this is true in theory, and almost every scheme brought forward for the, so-called, consumption of smoke lays claim to great advantages on the score of economy, it seems that no important saving has yet been effected in practice. Even an act of parliament, passed in consequence of the Report of a Select Committee appointed in 1819 and 1820, 'to inquire how far it may be practicable to compel persons using steam-engines and furnaces in their different works, to erect them in a manner less prejudicial to public health and public comfort,' though it has afforded the means of removing the nuisance in some instances, has failed to relieve our manufacturing towns generally from the murky exhalations of furnace-chimneys, notwithstanding the recorded opinion of the committee that the object sought after—an efficient means of destroying smoke—had 'been satisfactorily and effectually obtained.'

It may be observed that the quantity of smoke emitted from furnace-chimneys varies much with the state of the fire; being greatest when a mass of fresh fuel is thrown on, and least when the fire has burned clear, or the fuel is fully ignited. Attention to this circumstance, on the part of the stoker, will greatly diminish the nuisance; because if he throw on the fresh fuel in a thin layer, it will the sooner become perfectly ignited; and, by laying it in the fore part of the furnace, the dense smoke arising from it has to pass over that part of the fire which is in a state of more perfect combustion, and is thereby in a great measure consumed. Many of the contrivances introduced or suggested as smoke-consuming furnaces act on these principles; arrangements being adopted to insure the right feeding of the fire without much attention on the part of the firemen. In the apparatus of Mr. Steel, for instance, which is fully described and represented in the Report of the Parliamentary Committee of 1819, the fuel is supplied in a constant stream, by means of an inclined hopper; the quantity of coal supplied in a given time, and the size of the pieces, being regulated by means of a grooved roller; while it is distributed all over the furnace by the motion of the grate itself, which is of a circular form, and turns on a central pivot. A similar method of feeding the fire is adopted in Brunton's patent apparatus, of which an account will be found in the same Report. In some furnaces of the more usual form a similar object is aimed at by inclining the grates, or making portions of them moveable.

It is usually stated that the first important attempt made in this country for the combustion of smoke was that of Watt, who obtained a patent in 1785 for a method of constructing furnaces in such a way as to cause 'the smoke or flame of the fresh fuel, in its way to the flues, or chimney, to pass, together with a current of fresh air, through, over, or among fuel which has already ceased to smoke, or which is converted into coke, charcoal, or cinders, and which is intensely hot; by which means the smoke and grosser parts of the flame, by coming into close contact with, or by being brought near unto, the said intensely hot fuel, and by being mixed with the current of fresh or unburned air, are consumed or converted into heat, or into pure flame, free from smoke.' Since that time innumerable plans have been brought forward for introducing the necessary supply of air to the furnace; but while many of them accomplish the purification of the smoke as completely as could be desired, they are generally found either to increase the consumption of fuel, or to weaken the draught of the furnace. If the air admitted to the furnace be cold, it diminishes the heat of the fire; and if hot, expense is incurred in heating it, whether this be effected by a separate fire or by passing the air in pipes through the chimney. Without pretending to enumerate the plans that have been tried, even within the last few years, allusion may be made to the experiments of Mr. Chanter, especially as applied to the use of coal in locomotive engines. Most railway companies are required, by their acts of incorporation, to avoid the emission of smoke from their engines; and this is usually done, at great expense, by the use of coke. The plain of Mr. Chanter, which has been tried with great promise of success, consists in the introduction of a *deflector* dipping into the burning fuel, which compels the smoke from the crude coal to pass through a mass of burning coke, which is supplied through a small door, and conducted at once to the back of the furnace. By this means three parts of coal may be used to one of coke, with very little risk of much smoke.

Another mode of destroying smoke, which appears to answer the purpose very completely, is by injecting steam into the furnace. The plan has been tried by several individuals; but the apparatus which has attracted most notice is that of Mr. Iveson, in which the steam is thrown into the fire in several minute jets, from a fan-shaped distributor in the fore part of the furnace. The steam not only destroys the smoke, but also greatly increases the intensity of the fire; so much so, indeed, as to sanction the supposition that the steam is decomposed, and that its component gases are consumed. Thus the necessity for a large chimney is obviated, it being only necessary to provide a small passage for the escape of the gaseous products of combustion. Experiments on the same furnace, with and without the injection of steam, indicate a saving of fuel to the amount of thirty-three per cent.; the consumption in five hours being respectively 558 and 812 lbs. As a drawback from this saving, the plan requires, in a steam-engine furnace, about one-tenth of the steam generated, and in other furnaces renders necessary the erection of a small boiler. It is proposed, in high-pressure engines, to make use of the waste steam for the purpose of injection. A patent was obtained in 1838, by Mr. Chappé, for the use of a stream or shower of hot water thrown into the furnace in the same way.

Besides the numerous plans for the combustion of smoke, various methods have been tried on a limited scale for conducting it to a distance from the buildings in which it is formed, by means of subterraneous channels; and for condensing it by means of a shower of water, so that the sooty matter might be conveyed away by the sewers. Some interesting experiments on the purification of the noxious smoke emitted from copper-smelting furnaces, are detailed in Gill's 'Technical Repository,' vol. iv., p. 1, &c. Without offering any opinion as to the means best adapted for the purpose, it may be observed that some simple and economical method of destroying the nuisance of smoke, from private houses as well as from factories and steam-vessels, would tend greatly to the salubrity and cleanliness of large towns, and will probably soon be introduced.

SMOKE-JACK, an apparatus believed to be of German origin, by which the rising current in a chimney, acting upon the inclined vanes of a wheel fixed in the funnel, gives motion, through a train of wheels, to any matter which is hung before the fire to roast. This contrivance is now almost superseded by jacks impelled by the descent of a weight or the uncoiling of a spring. The smoke-jack appears to be of early origin; for it is stated in the fourth edition of the 'Encyclopædia Britannica,' on the authority of Messinger, that it is represented in a painting at Nürn-[illegible] which is known to be older than 1350.

SMOLENSK, a government of the Russian empire, was acquired by Russia from Lithuania in 1654. It is situated between 53° 12′ and 56° 30′ N. lat., and between 30° 20′ and 35° 20′ E. long., and is bounded on the north-west by Pskow, on the north-east by Twer, on the east by Moscow, on the south-east by Kaluga and Orel, on the south by Czernigow, on the south-west by Mohilew, and on the west by Witepsk. The area is 20,000 square miles, and the population 1,200,000.

The country is an undulating plain, broken only by low hills. The soil is clay, mixed with sand and black mould. Some parts are very fertile, and all well repay the expense of cultivation. The country forms an elevated table-land, and a part of the Alauman Hills extends into it from the north-west, and contains the sources of several considerable rivers. There are many marshes. The principal rivers, are 1, the Dnieper, which rises in the marshes, but though swelled by the junction of several other rivers, is shallow and not navigable in this government; 2, the Obscha; 3, the Mischa; 4, the Kaspla, which run in a westerly direction to the Düna; 5, the Ugra, which flows eastward to the Oka; 6, the Gshat, and 7, the Wasuga, both which run into the Volga. There are, it is said, 150 lakes, but none of considerable extent, and many morasses. As the country lies so high, the climate is colder than that of other provinces in the same latitude. The frost in winter is very severe, and the ice does not break up till April; on the other hand, the heat of the summer months is very great, vegetation luxuriant, the weather not changeable, and the air healthy.

Natural Productions; Agriculture; Manufactures; Trade.—The government produces corn (especially rye), about four million chetwerts in a year, hemp, flax, tobacco and hops, culinary vegetables, and some fruit, but the wealth of the country consists chiefly in the immense forests, which supply timber for the use of the province itself, and also for the navy, particularly fine masts, which are sent to Riga. These forests abound in game of all kinds; elks, deer, wild boars, wolves, bears, and lynxes are found in them, and prodigious quantities of wild birds. Much attention is paid to the breed of horses, which are of a good Lithuanian race. Oxen are used in agriculture as well as horses; and great numbers are fattened for exportation. Swine are very numerous, but sheep do not appear to thrive. The fishery is of no importance; the quantity of sturgeon, shad fish, &c. does not exceed four thousand poods in a year, and the profit is not above seven thousand rubles. The country-people have great numbers of bees. The minerals are copper, salt in abundance, and bog-iron. Though Smolensk is not among the manufacturing provinces of the empire, the inhabitants being chiefly engaged in agriculture and rural occupations in general, the country-people manufacture linen and woollen cloths. The Smolensk carpets are in great repute, and employ a large number of looms, which are mostly worked by the women. There are numerous saw-mills, brandy distilleries, tanneries, soap and candle manufactories, and some glasshouses.

The exports of this government are corn, flour, groats, peas, hemp, and flax of superior quality, some hemp-seed and linseed and oil, horse-hair, hides, hogs' bristles, wool, honey, wax, masts to Riga, timber and firewood to the Dnieper, boats made for the navigation of the Oka, the Volga, and the Düna; horses, oxen, swine, salt pork, tallow, and lard. Most of the articles are conveyed by land to Riga, Wilna, and Moscow; a great part of the cattle are driven to Poland, and thence to Germany, and the timber is floated down the rivers which fall into the Düna, the Oka, and the Volga. The imports are colonial produce, wines, fine manufactured goods, and various articles, which, if they cannot be called necessaries, nor yet designated as luxuries, are however nearly indispensable to the comfort and convenience of civilized life. The principal commercial towns are Wiasma and Gshatsk. Smolensk, situated on the main road to Moscow, likewise takes an active share in the foreign commerce, but is chiefly engaged with inland and retail trade.

Religion and Education.—The great majority of the inhabitants are of the Russian-Greek church, under the bishop of Smolensk, whose diocese is co-extensive with the government, and has 608 parishes. The Poles, Jews, and Germans are few in number. For public instruction Smolensk is under the University of Moscow, but education is very backward. In 1832 there were only 18 civil schools with 41 teachers and 1667 scholars; 4 ecclesiastical schools, with 27 teachers and 1244 scholars;—total, 28 schools, 73 teachers, 2911 scholars; so that there was only one scholar out of 450 inhabitants. Many schools have been since founded, but we have not the specific official accounts. The government is divided into twelve circles.

SMOLENSK, the chief town of the government, is in 54° 50′ N. lat. and 32° E. long., on the right bank of the Dnieper, which is there navigable, and over which there is a wooden bridge. It is the key to the interior of the Russian empire, on the road to Moscow, and is strongly fortified: it is surrounded with a wall 30 feet high and 15 feet thick, nearly two miles in circuit, and has a strong citadel. Smolensk is one of the most ancient towns in Russia, and the date of its origin is not known. Its name occurs in the Russian Annals as far back as 879. It was subsequently an independent principality, and from the beginning of the thirteenth century suffered by the attacks of the Russians of Kieff, of the Tartars, and the Lithuanians. The Lithuanians obtained possession of it in 1413. In the next two hundred and fifty years it was repeatedly taken and retaken by the Poles and Russians, till it was finally taken by the latter in 1654, and formally ceded to them by Poland by the treaties of 1667 and 1686. It was then strongly fortified. In 1812 the first serious conflict between the army of Napoleon and the Russians, under Barclay de Tolly, took place on the 16th and 17th of August, under the walls of Smolensk, when it was bombarded and set on fire. Two-thirds of the town were reduced to ruins. The Russians stated their loss at 4000 men; that of the French was 8000, and that of the Poles 3000. The Russians could not pardon Barclay de Tolly for giving up this holy city, as they call it, without a pitched battle. On the disastrous retreat of the French in November, they blew up part of the works. In 1813 there remained only 139 habitable houses, and 217 capable of being repaired. The number of the inhabitants was reduced to 3000. Smolensk, though not a handsome city, is now much superior to what it was before 1812, when it was almost entirely built of wood. The part rebuilt since that time is more regular; the houses generally of stone, and many of them handsome. The public buildings are numerous; there are sixteen Greek churches, three convents, one Roman Catholic and one Lutheran chapel, numerous charitable institutions, a gymnasium, a seminary for priests, a military school, &c. The manufactures are linen, leather, silks, hats, and soap; and the inhabitants carry on a brisk trade in their own manufactures and in the natural productions of the country. The population at the lowest estimate is now 12,000; some late writers state it at 20,000.

WIAZMA, about 110 miles from Smolensk, on the road to Moscow, is a considerable town, with 12,000 inhabitants. It is situated on the river of the same name, and is built on a hill, and surrounded with a wall. There being large vacant spaces, it covers a great extent of ground, so that viewed at a distance it looks much more considerable than it really is, an illusion which is aided by the steeples and domes of nearly thirty churches.

PORIETSCHIE, on the Kasplia, which is here navigable, is a town with 3900 inhabitants, 56 miles from Smolensk. It has a considerable transit trade, and is the staple place for the commerce between Smolensk and Riga.

DOROGOBUSH, on the Dnieper, is a pretty and well-built town, with 4000 inhabitants, who have some manufactures and considerable trade.

SMOLLETT, TOBIAS, was born in the parish of Cardross in 1721, of good family; his grandfather, Sir James Smollett of Bonhill, upon whom he was left dependent, being a member of the Scottish parliament. The lovely scenery among which he was bred had no doubt considerable influence on his tastes and feelings; and he describes them in 'Humphrey Clinker' with great relish. He was sent to school at Dumbarton, where, under Mr. Love, he made great proficiency in the classics. His tendency to ridicule was manifested very early, and he wrote abundant satirical verses on his schoolfellows; and he also, with a boyish patriotism, wrote a poem on 'Wallace,' which has been lost. He left Dumbarton for Glasgow, where he chose the profession of medicine, and was apprenticed to Mr. Gordon, surgeon, whom Smollett is supposed to have ridiculed as Potion, in 'Roderick Random.'

His medical studies were but indifferently pursued; the more attractive pursuit of literature and history—the passion for miscellaneous reading which so often besets men of genius, unable to confine themselves to any one branch of study—and which so materially assisted him in his subsequent literary career—diverted his attention. Satirical verses; practical jokes, prompted by a wild reckless spirit of enjoyment; poetical and literary studies; fruitless endeavours to give the proper direction to his energies; these occupied, not quite unprofitably, his early years. Before completing his eighteenth year he finished a tragedy called 'The Regicide,' the preface to which, written ten years after, is perhaps the most amusing portion. It would be unjust to require in such a production any of the requisites of tragedy; it would be unjust to object to so prosaic a man as Smollett, that it is only stilted prose; and it would be still more unjust to criticise it otherwise than as the production of a boy; but when we find him in his preface railing at the managers, and looking on himself as a very ill-used man because it was not produced; and when we look at this tragedy, which he brought with him to London in the hopes of making his fortune, we cannot wonder at the tricks of managers, nor at his being reduced to 'print it, and shame the rogues.'

In 1741 Smollett was appointed surgeon's mate on board a ship of the line, and he sailed on the expedition to Carthagena. He describes this expedition in 'Roderick Random,' and also with historical accuracy in the 'Compendium of Voyages and Travels' which he published in 1756. He quitted the service in disgust whilst in the West Indies, and resided for some time in Jamaica, in what capacity is not known. It was here that he met and fell in love with Anne Lascelles, whom he subsequently married. On his return to London, 1746, his imagination was inflamed at the exaggerated descriptions of the severities practised in the suppression of the Scottish rebellion, and accordingly vented itself in some stanzas of prosaic fustian, entitled the 'Tears of Scotland.' 'His friends wished him to suppress this piece, as having a tendency to offend the Whigs, on whose patronage he had some reliance; and although his enthusiasm was at present too warm for advice, and he had from this time declared war against the Whig ministers under George II., yet it does not appear that it was published with his name for many years after.'

'Advice,' a satire, was his first appearance in public, in 1746. It has all the dirt and vehemence of Juvenal, with none of the power; it alarmed and disgusted his friends, amused his enemies, and enraged the persons attacked. He wrote also an opera for Covent-garden, called 'Alceste.' But his ungovernable temper was perpetually provoked at the delays and hindrances of a theatre, and a quarrel with the manager prevented its being acted. The next year he again disgraced himself by a satire, the 'Reproof,' a sequel to the 'Advice,' and of the same stamp, with some bitter lines on Rich, the manager of Covent-garden. It is curious to see how he quarrelled with all the managers, and thus for ever shut the theatres against him; and not content with quarrelling, he abused and ridiculed all who did not agree with him on the merit of his pieces. Garrick, Lacy, Rich, Quin, Akenside, Lord Lyttleton, were all introduced by him into his novels and satires, and made to pay the penalty of having offended an author's vanity. In this year, 1747, he married Miss Lascelles, who was to have had three thousand pounds, but owing to a suit he obtained only a small portion of this dowry. This disappointment, together with sundry extravagances he had been led into, placed him in a very unpleasant pecuniary position, to relieve which he published, 1748, 'Roderick Random,' the first and best of his novels. It is an admirable novel, and one which must ever be a favourite. The style is easy and unaffected: the incidents rapid, varied, but loosely connected and often purposeless. The humour is broad, palpable, and coarse—mostly of a physical nature, and deriving its force from external circumstances; for instance, Roderick's 'carroty locks, which hung down over his shoulders like a pound of candles'—the adventure of Strap and Mrs. Weazle (which bears some resemblance to Chaucer's 'Reve's Tale')—Strap's ignorance of London, and the adventures and blunders which arise therefrom. Smollett's humour is essentially vulgar, but hearty. He exhibits, as Hazlitt said, the ridiculous accidents and reverses to which human life is liable, not the 'stuff' of which it is composed. Smollett does not probe to the quick, as Fielding does, nor penetrate beyond the surface. He has great knowledge of 'life,' especially in its worst shades, but little of 'character.' He knows the peculiarities of men better than their motives; their eccentricities better than their natures. In a word, he has a ready eye to seize the superficial distinctions of manner and appearance, but little insight into the passions and character. Here lies Fielding's superiority. On the other hand, he has a 'rude conception of generosity in some of his characters, of which Fielding seems incapable, his amiable persons being merely good-natured. It is owing to this that Strap is superior to Partridge; as there is a heartiness and warmth of feeling in some of the scenes between Lieutenant Bowling and his nephew, which is beyond Fielding's power of impassioned writing.' (Hazlitt's *Comic Writers*, p. 238.)

In 1750 Smollett went to Paris, but his prejudices against the French and his ignorance of their language rendered his stay there a short one. The year after he published 'Peregrine Pickle,' which was greatly read and applauded. He received 'a handsome reward' for inserting the prurient and profligate memoirs of Lady Vane, and they form such a mere episode, we wonder they have not been expunged. It might suit the morbid vanity of the 'lady' to pay a large sum for the insertion of her memoirs in a popular novel; but what are we to say to the author who received the money for such a purpose?—one too who described himself as—

> 'Too coy to flatter and too proud to serve,
> Thine be the joyless dignity to starve.'

Having done it, we are not to be surprised at his 'flattering himself that he had expunged every adventure, phrase, and insinuation that could be construed by the most delicate readers into a trespass upon the rules of decorum:'—the one was a consequence of the other. After 'Peregrine Pickle' was published, he resumed his medical profession, and announced himself as Dr. Smollett; but from what university he obtained his degree was a secret, and remains one. With this character however he endeavoured to set up in Bath, and published a pamphlet on the 'External Use of Water.' Nobody however seemed inclined to trust their healths with the 'popular author'—reputation, unless exclusively professional, being a greater drawback to success than the most profound stupidity. Disappointed therefore in this design, he again took up the pen as a profession, and fixed himself in Chelsea, where he wrote the 'Adventures of Ferdinand Count Fathom.' This novel has not been relished so much as the others, and with reason; the subject and characters are disgusting, and the story is tedious and spun out. There is however some biting satire on the follies and vices of the world, and some powerful writing in it. The robber-scene in the forest is a masterpiece of effect.

In 1755 he published by subscription his translation of 'Don Quixote;' this translation, which has been so often praised, is worthless. Let any one compare it with the original, and he will be struck with its inefficiency. All the difficult passages are slurred over; Sancho's dry proverbial humour is lost, by having a sort of conscious slang mixed with it; the exquisite gravity of the Don is lost—his use of antique heroic words, such as 'insula' for 'isla,' 'las fazañas que han fecho' for 'las hazañas que han hecho,' &c., is not represented; the melancholy and poetical shades of his character are not seized, and the whole becomes vulgarized. Lord Woodhouslee was the first to detect, in his 'Essay on Translation,' that Smollett had founded his translation on the forgotten one of Jarvis. He is said to have excelled Jarvis, but we think without justice. Jarvis had a greater knowledge of Spanish; and if his translation be dull, it is at least free from the vulgarity and Smollettism (so to speak) of Smollett, which the latter has contrived to infuse into his translation.

Smollett then visited his relations in Scotland, and on his return to London undertook the management of the 'Critical Review,' which was to oppose the 'Monthly Review.' His taste was vitiated and capricious, and his temper irritable: his jealousy bitter and watchful, and his vanity enormous. These were not the qualities desirable in an editor, and in consequence his power to offend, coupled with his delight in offending, disgraced the 'Review' with unseemly personalities. Among the many he attacked was Admiral Knowles, who brought an action against the printer of the 'Review' for a libel. Smollett, by applying to persons acquainted with Knowles, endeavoured to stop the action, but without avail, and when judgment was about to be pronounced on the printer, he stepped forward and declared himself the author, and was sentenced to pay 100*l.* and be imprisoned for three months. In 1757 he wrote the 'Reprisals, or the Tars of Old England,' a comedy, which Garrick, in spite of their old quarrel, produced on the stage, where however it had only small success. In 1758 he brought out his 'Complete History of England from the earliest times to the treaty of Aix-la-Chapelle in 1748.' This was written in the space of fourteen months—a specimen, as it has been observed, of 'literary industry,' a specimen also of literary presumption. Neither his temper of mind nor his pursuits had qualified him to be an historical writer. But the work was written in a clear and easy style, and it was very popular, and was immediately reprinted in 8vo. weekly numbers, of which an edition of ten thousand was rapidly sold.

During his imprisonment he wrote the 'Adventures of Sir Launcelot Greaves,' a stupid and tedious imitation of 'Don Quixote.' But the characters of Crowe, Ferret, and Clarke are amusing. This novel was printed in detached parts in the 'British Magazine.' The success of his 'Complete History' induced him to continue it from 1748 to 176. The volume for 1765 was written by Guthrie during Smollett's absence on the Continent. Smollett is also supposed to have written the accounts of France, Italy, and Germany for the 'Universal History.'

On Lord Bute's promotion to the administration, Smollett defended him against Wilkes in a paper called the 'Briton,' which Wilkes answered by his celebrated 'North Briton.' Smollett's paper was however soon discontinued and his services unpaid. About 1764 also, having mastered the French language, he was engaged in a translation of the works of Voltaire and a compilation entitled 'The Present State of all Nations.' In June, 1763, 'traduced,' as he sentimentally informs us, 'by malice, persecuted by faction, and overwhelmed by the sense of domestic calamity,' he went to France and Italy, and on his return published the result of his observations, 'Travels through France and Italy.' Splenetic and prejudiced, this work has long been forgotten. His increasing ill-health made travelling necessary, and accordingly he went to Scotland and from Scotland to Bath, and in 1767 found himself considerably restored. His renewed vigour was shown in the 'Adventures of an Atom,' a violent political satire, wherein, under fictitious names, he abused ministers. But his health again requiring a milder climate, this 'independent writer,' this man too 'coy to flatter,' got his friends to solicit the very ministers whom he had satirized, for a consulship. It can occasion no surprise that this application did not succeed.

In 1770 however he left England again for Italy, writing on the way 'The Expedition of Humphrey Clinker,' a pleasant gossiping work, which has remained a favourite. 'It is quite as amusing as going the journey could have been, and we have just as good an idea of what happened on the road as if we had been of the party. Humphry Clinker himself is exquisite; and his sweetheart Winifrid Jenkins not much behind him. Matthew Bramble, though not altogether original, is excellently supported, and seems to have been the prototype of Sir Anthony Absolute in the "Rivals." But Lismahago is the flower of the flock. His tenaciousness in argument is not so delightful as the relaxation of his logical severity when he finds his fortune mellowing in the wintry smiles of Mrs. Tabitha Bramble. This is the best preserved and most severe of all Smollett's characters. The indecency and filth in this novel are what must be allowed to all Smollett's writings.' (Hazlitt's 'Comic Writers,' p. 239.)

In the neighbourhood of Leghorn he lingered through the summer of 1771, and died on the 21st of October, in the fifty-first year of his age. Stout, well-proportioned, and engaging in person; cold in his manners; impetuous, irritable, and unforgiving in temper; contemptuous and bitter towards all differences; hearty and loving in all sympathies; proud and yet mean; vain, yet generous; of quick, versatile intellect; considerable information; broad exuberant humour, and shrewd observation—such appears to have been Tobias Smollett. As a novelist he stands next to Fielding—as a poet he is not to be named—and in reference to his other works he must be looked upon as a mere bookseller's hack, writing for bread, with no other object than dispatch.

SMUGGLING is the clandestine introduction of prohibited goods; or the illicit introduction of goods by the evasion of the legal duties. Excessive duties present an overwhelming temptation to men to evade them; and the law loses a great part of its moral influence when it first tempts to violation of it and then punishes the offence. In parts of a country where a 'free trade' is extensively carried on, the smuggler is rather a popular person than otherwise; in some countries, as in Spain, still more than in England. His neighbours do not usually regard his mode of acquiring a livelihood disgraceful, but rather look upon him as a benefactor who supplies them with necessaries and luxuries at a cheap rate. 'To pretend,' says Adam Smith, 'to have any scruple about buying smuggled goods would in most countries be regarded as one of those pedantic pieces of hypocrisy, which, instead of gaining credit with anybody, serve only to expose the person who pretends to practise them to the suspicion of being a greater knave than the rest of his neighbours.' This is probably rather too strongly expressed; but many persons even attach a fictitious value to goods which have been smuggled, on account of their cheapness and supposed excellence; so much so, that articles which have duly passed through all the forms of the custom-house are frequently offered for sale as contraband. It is the crimes and the moral evils which are the offspring of smuggling that are to be dreaded rather than smuggling itself. The true remedy is a wise tariff. It annihilates at once a traffic which no ingenuity can ever put down; for all experience proves that so long as a profit can be made by smuggling sufficiently high to counterbalance the necessary risk, it will not fail to flourish. The decrees of Berlin and Milan, instead of annihilating commerce, only forced it into extraordinary channels. Silk from Italy, for example, instead of being received in England by the most direct means, often arrived by way of Archangel and Smyrna; in the former instance being two years, and in the latter twelve months on its passage. Sugar, coffee, tobacco, and cotton-twist were dispatched from England to Salonica, and thence conveyed by horses and mules through Servia and Hungary to Vienna, from which place they were distributed over the Continent, in defiance of the rigorous decrees of Napoleon: it might happen that coffee was consumed at Calais which, instead of being sent direct from London, arrived by the above circuitous route. The risks of this illicit traffic, and the enormous expense under which it was carried on, raised the price of sugar on the Continent to 5*s.* and 6*s.* per lb. The refined sugar was packed in small boxes made in England, and capable of containing about two cwts., so as to admit of one box being slung on each side of a horse or mule for the overland journey. (Tooke's *Hist. Prices*, i. 310.) The slave-trade may be mentioned as another instance of the impossibility of putting a stop to any traffic which is a source of great profit. The slave-traders of the Havanna gave from 35 to 40 per cent. as a premium of insurance on their African risks; but at this rate the assurance companies did not realise a profit, though they sustained no serious loss. This proves that nearly two out of every three adventures are successful; and as one out of three would at least have covered all loss, the difference makes a profit of at least cent. per cent. to the slave-dealer. Until this profit be reduced, the slave-trade cannot be effectually suppressed. (Turnbull's *Cuba*, 1840.) Whenever duties exceed 30 per cent. ad valorem, it is impossible to prevent a contraband trade.

We have only to examine the tariff of any country to know if smuggling is practised; and if a bad system of commercial policy has been long pursued, there the smuggler will be found. The *contrabandista* of Spain figures in novels and tales of adventure. In no country is the illicit trade so general and extensive. The exports to Gibraltar from England considerably exceed a million sterling per annum, and a very large proportion of British goods is introduced by smugglers into the interior. Mr. Porter states (*Progress of the Nation*, ii. 111) that nearly the whole of the tobacco imported into Gibraltar, amounting to from 6 to 8 million lbs. per annum, is subsequently smuggled into Spain, where the article is one of the royal monopolies. On the French frontier the illicit trade is equally active.

The vicinity of France and England, and the injudicious character of their respective tariffs, have encouraged smuggling to a large extent on both sides of the Channel. 1. Smuggling of French goods into England. Spirits, tea, tobacco and silk goods, and more particularly brandy, from the high duties imposed on it in this country, constitute the most important articles of the illicit trade. The total amount of duties evaded in 1831 by the smuggling of French goods into the United Kingdom was estimated to exceed 800,000*l.*, exclusive of tobacco, 'whole cargoes of which are sometimes introduced from the French bonding warehouses into Ireland.' (*Report on the Commercial Relations between France and England*, by Mr. Poulett Thomson (late Lord Sydenham) and Dr. Bowring.) The duty on tobacco in England is above 900 per cent.; and Lord Congleton states (*Financial Reform*) that three-fourths of the tobacco consumed in Ireland is believed to be supplied by smugglers. Mr. Porter, of the Board of Trade, proved before the Imports Duty Committee, in 1840, that 48 per cent. of French silks imported into England paid no duty whatever; and that the loss to the revenue in twelve years, from 1827 to 1838, amounted to 1,792,439*l.* In the Report just quoted, the loss to the revenue on smuggled French brandy was estimated, in 1831, as considerably exceeding 500,000*l.* a year. The duty is 22*s.* 6*d.* per gallon, and the smuggled brandy is usually 33 per cent. above proof, the proof being 22. Dunkirk, Calais, Boulogne, Fécamp, and Cherbourg are the head-quarters of the French smugglers, who in the northern parts of France are chiefly Flemings, and in the Channel ports Normans. The landing is usually effected during dark nights on the coasts of Kent and Sussex, or farther to the west, as may best suit their purpose. The premium on the illicit introduction of French goods into England was, in 1831, for gold trinkets, from 6 to 10 per cent.; silver, 10 to 12; silk goods and ribands, 22 to 25 per cent.; tea, 50 per cent.; and spirits 80 per cent. 2. Smuggling English goods into France. The extensive land frontier of France, and the offices for collecting the *octroi* duties in inland towns, give rise to some peculiarities in the smuggling-trade in France. It is not sufficient to land merchandise on the coast, as in England, but it has to pass the local custom-houses at the barriers of the large towns. This adds greatly to the difficulty and expenses of smuggling. It is stated that in 1831 the premium on landing English woollens on the French coast was 55 per cent.; at the barriers of Paris 63 per cent.; and within the walls 10 per cent. additional; making in all 73 per cent.; the premium on cotton goods being 65 per cent. English goods are chiefly introducted by the Belgian frontier, and the smugglers have their depôts at Cambray, St. Quentin, Ypres, Tournay, Mons, and other towns in the adjacent departments. In the Report of 1831, already quoted, it is stated that in that year the amount of British goods smuggled into France by this frontier exceeded 2,000,000*l.* in value; but if the ports on the Channel were included (of which no estimate is given), this amount would be greatly increased. Cotton-twist is the most important article in the illicit trade. Cotton-yarns, when once lodged in the manufacturer's warehouse, cannot be seized, and in consequence of the article being essential to the progress of manufacturing industry in France, the government, instead of reducing the duty, in some degree connives at its illicit introduction. Bobbin-net is extensively smuggled, also quiltings, cambric, and muslins; and tobacco is clandestinely introduced both by sea and land, the price of the inferior article produced under the royal monopoly being from 300 to 400 per cent. above the English and Dutch bonded prices. The smuggled tobacco finds its way to a great distance in the interior: at two or three leagues distance from the frontier it is 80 or 90 per cent. above the foreign prices, while at Amiens and in the inland towns it is 150 per cent. above the foreign price. A considerable quantity of fine cutlery is also smuggled. Smuggled sugar, coffee, and other bulky articles are consumed in the districts adjacent to the frontier. The agents of the smuggling companies regularly attend 'Change. They effect insurances to cover the risk of seizure, and make arrangements for the conveyance of smuggled goods into the interior. The houses importing these goods usually run from one-half to two-thirds of the risk; the rate of insurance varies considerably in the different custom-house districts; and the goods are valued at from one-half to two-thirds of the cost price. On the Belgian north-eastern and eastern frontier dogs are trained to convey smuggled goods into France. They are of a large size, and carry from 22 to 26 lbs. each of tobacco and colonial produce, and sometimes cotton-twist and manufactured goods. A single dog has been seized conveying goods worth from 20*l.* to nearly 50*l.* These dogs are conducted across the frontier in packs, are kept without food many hours, then beaten, and at night-fall their load is fixed upon them, when they start for their destination, which is usually two or three leagues on the other side of the frontier. On their arrival they are well fed. From

1820 to 1830 not fewer than 40,278 of the smuggling dogs were destroyed, a reward of three francs being offered for each.

The nature of the frontier by which a country is bounded necessarily exercises considerable influence on the character of its tariff. It would, for example, be nearly impossible to prevent the smuggling of British goods into the United States on the Canadian frontier if the duties on importation were excessive. This consideration has induced the legislature of Texas to raise the public revenue by direct taxation, and the importation of merchandize is charged with very trifling duties.

In 1822 the cost of preventing smuggling in England was enormous. The Preventive Service and the Coast Blockade were organized for this purpose, and were aided by a fleet of fifty-two revenue cruisers. In 1822 and 1823 there were captured on the English coast 52 vessels and 355 boats engaged in smuggling. For the half-year ending April, 1823, the cost of this department of the public service amounted to 227,145*l.*, and the seizures were valued at 67,000*l.* The Coast Blockade consisted of 1500 officers and seamen of the royal navy, who were employed on shore under the orders of the Admiralty; and the Coast Guard was under the authority of the Board of Customs. In 1832 upwards of 191,000*l.* had been expended in building cottages for the officers and men of the Coast Guard in Kent and Sussex. Lord Congleton estimated the total annual cost of protecting the revenue in 1831 at from 700,000*l.* to 800,000*l.* For several years frequent conflicts took place between the officers of the revenue and smugglers, the latter being generally aided by the country-people. In 1830 there were 116 persons under confinement in England, and 64 serving in the navy as a penalty for smuggling offences. The counties on the Scottish border were at one period rapidly becoming demoralized by smuggling, the duties on spirits being much higher in England than in Scotland. In two years 163 informations were laid in the counties of Northumberland and Cumberland for smuggling spirits. The duties being reduced more nearly to an equality, these evils ceased on the border; and the quantity of spirits charged with duty in Scotland rose from 2¼ million gallons in 1822, to nearly six million gallons in 1825. The reduction of the duties on silks, tea, and British spirits has done more to repress smuggling than all the efforts of the revenue officers aided by a large armed force. In 1841 the number of persons under confinement in England for offences against the Customs laws was 65, all for periods under six months, with two exceptions; and in Ireland there were none under confinement.

The direct cost incurred for the protection of the customs revenue was as follows in 1840:—Harbour vessels, 7250*l.*; Cruisers, 118,543*l.*; Preventive Water-Guard, 349,471*l.*; Land Guard, 19,662*l.*: total, 494,930*l.* The Board of Excise employs cruisers for the protection of the revenue collected under its authority, the cost of which amounted to 5458*l.* in 1840; and also a force in Ireland called the Revenue Police, whose maintenance in the above year cost 42,095*l.* The total charge for collecting and protecting the customs and excise revenues of the United Kingdom was 2,309,611*l.*; namely, 1,286,353*l.*, or 5*l.* 8*s.* 9¾*d.* per cent., for the customs; and 1,023,258*l.*, or 6*l.* 10*s.* 11¼*d.* per cent., for the excise. In 1835 the number of persons employed in the department of the customs was 11,600; and in the excise 6072. The present Acts relating to smuggling are 3 and 4 Wm. IV., c. 53, and 4 and 5 Wm. IV., c. 13.

SMUT. [Uredo.]

SMYRNA, one of the most antient Greek cities in Asia Minor. There was an Old Smyrna (*ἡ παλαιὰ Σμύρνα*) and New Smyrna. The old town lay on the north-east side of the Hermæan Gulf, which is sometimes called the Gulf of Smyrna. According to some traditions it was originally an Æolian colony, and was afterwards taken possession of by some Ionian exiles of Colophon. (Herod., i. 16, 149.) Another account describes it as an Ionian colony of Ephesus, where a part of the old town is said to have borne the name of Smyrna from an Amazon of the same name. Afterwards however the Ephesian colonists are said to have been expelled by the Æolians, and to have fled to Colophon, whence a short time after they returned, and recovered their original home. (Strab., xiv., p. 633, &c.) This latter account is not only in itself the more probable, but also contains the elements out of which the other may have arisen. (See Thirlwall's *Hist. of Greece*, ii., p. 93, in a note added to Schmitz's German transl.) After Melite, one of the Ionian towns, had been destroyed by the common consent of the other Ionians, Smyrna was admitted into the confederacy. This antient town of Smyrna was by some supposed to have been the birth-place of Homer; and in its vicinity, on the banks of the little river Meles, there was a grotto in which Homer was said to have composed his poems. The Smyrnæans were proud of this tradition, and endeavoured to propagate it. The Lydian king Alyattes took and destroyed Smyrna, and distributed the inhabitants among a number of villages in the neighbourhood. (Strab., xiv., p. 646; Herod., i. 16.) In this state they remained, according to Strabo, for 400 years, after which the town was rebuilt with great splendour by Antigonus and Lysimachus, or, according to Pausanias (vii. 5, 1), and Pliny (v. 31), by Alexander the Great. This new town however was 20 stadia distant from the site of Old Smyrna, and 320 stadia from Ephesus, and was situated on the north bank of the river Meles, covering the plain as far as the sea, and occupying also a part of a hill which Pliny calls Mastusia. It was adorned with several magnificent buildings, among which the Homereum was a square edifice surrounded by colonnades, containing a temple and a statue of Homer. The streets were paved with stone, and built at right angles to one another; but as no sewers were constructed to carry off the water and filth, the streets were very dirty, especially in rainy weather. But notwithstanding this, the city was or soon became the finest and largest in Asia Minor. (Strab., xiv., p. 646; Marm. Oxon., n. 5.) When Asia Minor fell into the hands of the Romans, Smyrna became the seat of a conventus juridicus (Plin., v. 31), and flourished as a commercial town. It received various grants and privileges from the Romans as rewards for the part it took in the wars with Antiochus and Mithridates, as may be seen from several passages in Livy and Polybius. Trebonius, one of Cæsar's murderers, was besieged in Smyrna by Dolabella, who took the city, and destroyed a great part of it. (Strab.; Cic., *Philipp.*, xi. 2.) But as in that most beautiful country even the heaviest calamities are soon got over, so Smyrna soon recovered and flourished as before. In the reign of Tiberius it received the honourable distinction of being allowed to erect a temple to the emperor. (Tacit., *Annal.*, iv. 56.) Christianity was early established here, chiefly owing to the zeal of Polycarp, who is said to have been the first bishop of Smyrna, and to have suffered martyrdom there. (Iren., iii. 3, 4, p. 176.) The whole neighbourhood of Smyrna appears in early times, as at present, to have been subject to frequent earthquakes; but that which occurred A.D. 178 visited the city most severely, and changed it into a heap of ruins, but it was restored by the emperor Marcus Aurelius. [Aristides: Ælius.] Before the introduction of Christianity the Smyrnæans worshipped chiefly the heroine Smyrna, Nemesis, Homer, and the mother of the gods, whose temple stood near the sea-coast, and whose head was represented upon several of their coins, as in that which is given below. (Eckhel, *Doctr. Num.*, ii. 537, &c.)

During the Eastern empire Smyrna again experienced several severe vicissitudes. Towards the close of the eleventh century it fell into the hands of Tzachas, a Turkish pirate, and was nearly destroyed by a Greek fleet under John Ducas. It was restored by the emperor Comnenus, but soon after fell into the hands of the Genoese, who continued in possession of it until the year 1364. In 1402 it was taken by Tamerlane, and suffered very severely. The conqueror erected within its walls a tower constructed of stones and of the heads of his enemies. Soon after it came under the dominion of the Turks, under whom it has always been the most flourishing city of the Levant, notwithstanding it has frequently been visited by earthquakes, fires, and the plague.

Smyrna, which the Turks call Izmir, is thus one of the very few antient cities which have survived to our times. At present it is the most important city of Asia Minor, and the centre of the Levant trade. Of her antient buildings however only very few traces remain. It rises in the form of an amphitheatre from the sea, and upon the hill there is an antient castle which forms the citadel; over one of the gates there is a head which either represents Apollo or an Amazon, and over another a Roman eagle.

The modern city of Smyrna is in 38° 25′ N. lat. and 27° 9′ E. long., about 210 miles south-south-west from Constantinople, direct distance. The situation is admirable, at the bottom of a capacious bay, with excellent anchorage, and so deep that large ships come close to the wharfs. The bay extends into the city, and its margin is lined with quays, on which there are handsome stone houses, so that the city, with its domes and minarets, has a fine appearance on approaching it from the bay; but a great part of the interior, and especially that part which is built on the side of the hill, consists of low wooden houses, and the streets are ill-paved, narrow, crooked, and dirty. The inhabitants are probably about 130,000, of whom about 70,000 are Turks, 20,000 Greeks, 10,000 Jews (the descendants of Jews who were expelled from Spain and Portugal), 7000 Armenians, and the remainder natives of various parts of the world, especially English, French, Dutch, and Italians, who reside there for purposes of commerce, and occupy, for the most part, the best quarter of the city near the bay. The port is frequented by ships from all nations, freighted with valuable cargoes both outward and inward. The greatest part of the trading transactions are managed by brokers, who are mostly Jews, the principals meeting afterwards to conclude the bargains. The chief imports are coffee from America, England, France, &c.; sugar, chiefly from England and America; indigo, chiefly from England; tin, exclusively from England; iron, from England, Russia, Sweden, &c.; lead, from England and Germany; cotton-twist, from England; manufactured cotton-goods, from England, America, &c.; rum and brandy, spices, [illegible], and a variety of other articles. The principal exports are, silk, chiefly to England; opium, to England, America, and Holland; drugs and gums, mostly to England; galls, to England, Germany, and France; cotton-wool, valonia, and fruit; figs are brought to market early in September, and are only to be had at Smyrna, but raisins, which are ready early in October, are shipped also in large quantities from other neighbouring ports. Besides these exports there are various kinds of skins, goats' wool, olive oil, wax, and a variety of other articles. This large commerce has naturally arisen, not only from the advantageous situation of the port, but from the judicious and liberal policy of the Turkish government, which has imposed hardly any restrictive enactments, with few duties, and those extremely low.

Many of the European States have their consuls at Smyrna, such as England, Sweden, Prussia, France, Venice, &c. The city and its territory are governed by a pasha, and the revenues are raised by a mussellim.

About midnight, on the 29th of July, 1841, a fire broke out at Smyrna, which, from the crowded state of the wooden houses, the want of water, and the violence of the wind, was destructive to a dreadful extent. About 12,000 houses were destroyed, including two-thirds of the Turkish quarter, most of the French quarter, and the whole of the Jewish quarter, with many bazaars, and several mosques, synagogues, and other public buildings. It was calculated that 40,000 persons were deprived of shelter and food. The damage was estimated at two millions sterling. Subscriptions to a large amount were soon raised at Smyrna, Constantinople, and elsewhere; the sultan gave money, and sent ships with articles of food and clothing; and a large subscription has since been raised in London among the merchants connected with the Levant trade.

An excellent description of the ancient as well as modern city of Smyrna was written by Prokesch, in the *Wiener Jahrbücher der Litteratur* for 1834, vol. 67.

Coin of Smyrna.

British Museum. Actual size.

The Greek legend on the one side of this coin is the [illegible] of the [illegible]: on the other side, within a crown of oak-leaves, we read ΣΜΥΡ[illegible] [illegible] ΙΠΠΟ, [illegible] Hipparchus.

SMYRNIUM (from σμύρνα, myrrh), a genus of plants belonging to the natural order Umbelliferae. It is known by its obsolete calyx; lanceolate or elliptical, entire, acuminate petals, inflexed at the point; didymous fruit, contracted at the side. The half fruits are almost globose and reniform, with three fine prominent ridges on the back, and two on the side, but almost obliterated; the channels with many vittae; the seed is involute; the species are upright smooth biennials with fleshy roots, ternate leaves, terminal umbels, and variable involucres. The flowers are yellow or yellowish green, and are frequently polygamous.

S. Olusatrum (Common Alexanders) has a taper stem; the leaves of the stem are ternate, with ovate serrated segments, and very short involucels. It is a native of the middle and south of Europe in humid places. It is found in Great Britain, and is observed most frequently near the coast, although not confined to such a locality. This plant was formerly much eaten in Europe both as a salad and potherb, on which account, and the black colour of its stalks and leaves, it derives its specific name *Olusatrum*, from *olus* and *ater*. Ray says that this is the *Herba Alexandrina* of Italy and Germany, whence our name Alexanders. It is supposed to have been originally brought from Alexandria. It flowers in May, and the whole plant dries up by the middle of July, but remains laden with large black seeds.

S. perfoliatum (Perfoliate Alexanders) has the stem angularly winged above, with ovato-cordate toothed leaves, which embrace the stem. This plant was obtained in Greece by Dr. Sibthorp, and is also an inhabitant of Spain, Italy, and Dalmatia. It is the *Smyrnium Dioscoridis* of Sprengel; and Sir J. E. Smith was of opinion that this species is the true σμύρνιον of Dioscorides, with whose description it remarkably agrees. (*Flora Graeca*, p. 209.)

SNAILS, the English name for the Slugs and shell snails. [Helicidae.] N.B. The secretion of the so-called *mucus calcareus* of the snail and other molluscous animals has been found to contain uric acid. Consult the paper by Jacobson and De Blainville, *Sur l'Existence des Reins dans les Mollusques*, in the *Journal de Physique*, tom. xci., p. 318.

SNAITH. [Yorkshire.]

SNAKE, a term commonly applied to any serpent, but more particularly used to designate the common snake, *Natrix torquata*. [Natrix.]

SNAKEROOT. [Polygala Senega.]

SNAKEWOODS. [Strychnos.]

SNELL, WILLEBRORD, a Dutch mathematician and philosopher, was born in 1591, at Leyden, in the university of which city his father, Rodolph Snell, the author of several scientific works, was professor of mathematics. He at first applied himself to the study of the law, but he very soon abandoned that pursuit, and devoted himself to the mathematics. In these he early made great progress, and at seventeen years of age he published an essay, in which it was attempted to restore the lost treatise of Apollonius, 'De Sectione determinata.' The work is said to have possessed considerable merit, and to have procured for the author a reputation among the scientific men of that time, but it has lost its importance since the publication of the more complete restoration by Dr. Simson. [Simson, Robert.]

In order to acquire information relative to scientific subjects beyond that which his own country afforded, Snell travelled to Germany, where he obtained an introduction to Kepler. From the conversation of this mathematician, during the three years of his absence from home, he obtained a great accession to his knowledge of the sciences; he appears also to have acquired the esteem and friendship of the celebrated German, and he regularly corresponded with him during the rest of his life. On his return to Leyden, his father having resigned his post in the university, the young mathematician was immediately appointed to succeed him. From this time he applied himself to the fulfilment of the duties of his professorship, to the performance of philosophical experiments, and to the composition of the works which have procured for him a high reputation among the learned men on the Continent.

His first publication was an explanation of the monetary system of the ancients, which appeared at Antwerp in 1613, in octavo, under the title, 'De Re Nummaria Liber Singularis.' His second and most important published work was entitled 'Eratosthenes Batavus de Terrae Ambitus vera Quantitate à W. Snellio suscitatus' (Leyden, 1617): it contains a description of the method of determining the magnitude of the earth by trigonometrical operations, combined with the observed latitudes of the stations; and Snell has the honour of being the first who put in practice a method which has since been almost always adopted by those who have undertaken that great geodetical problem. He measured a base line on the ground, and observed with circular instruments the angles between the stations: he then by computation found the length of the terrestrial arc between Alkmaar and Bergen-op-Zoom, from which arc, with the difference between the observed latitudes of those places, he deduced the length of a meridional arc of one degree. The method possesses great advantages over the older process of actually measuring the whole length of the meridional arc with rods, or, as Fernel, in the beginning of the sixteenth century, is said to have ascertained it, by the number of revolutions made by a carriage-wheel. The imperfection of the instruments employed was the cause that some inaccuracies occurred in the performance of the operations; these were however discovered by Snell; and it is said that he intended to have given the necessary corrections in a second edition of his book, but he did not live to complete them.

He published, in 1619, a work, in quarto, entitled 'Descriptio Cometæ qui ann. 1618 primum effulsit;' and two years afterwards his 'Cyclometricus, seu de Circuli Dimensione,' in which is given an approximation to the value of the circumference of a circle by a method more short than that of Van Keulen. His next work (1624), called 'Tiphys Batavus,' constitutes a treatise on navigation; and in 1627, that is, after his death, Hortensius of Delft published his 'Doctrinæ Triangulorum Canonicæ Libri Quatuor,' which contains the theorems of plane and spherical trigonometry, together with rules for the calculation of sines, tangents, and secants.

According to both Vossius and Huygens, Snell was the first who made the discovery that if a ray of light be incident on a refracting surface, and be produced within the medium, the parts of the refracted ray and of the produced incident ray intercepted between the point where the refraction takes place and any line passing through them perpendicularly to the refracting surface, have to each other a constant ratio. This discovery, which is said to have been made in 1621, is no other than the now well-known law between the sines of the angles of incidence and refraction, which Descartes published in his 'Dioptrics,' in 1637, as the result of his own researches. The experiments by which Snell discovered the law were never published; but Huygens states that he had seen the manuscript containing an account of them; and Vossius relates that the heirs of Professor Hortensius communicated the contents of the manuscript to Descartes. It is therefore very probable that Descartes obtained the idea from the works of Snell, to whom Montucla, Bossut, and most of the English philosophers agree in attributing the honour of this important discovery.

After having suffered during several years from bad health, Snell died, October 31, 1626, when thirty-five years of age; his wife survived him only eleven days, and both of them were buried in the same grave.

SNEYDERS, or SNYDERS, FRANCIS, a painter, born at Antwerp in 1579, was a pupil of Henry van Balen, and for a time followed the style of his preceptor, confining himself to the representation of fruit, flowers, and other objects of still life. He soon attempted the more difficult task of painting animals, in which, for freedom, truth, and energy, he became conspicuous, and for those qualities remains to this day, if not without a rival, at least inferior to no other artist. D'Argenville says that Sneyders went to Italy for professional improvement, and that at Rome he became an ardent admirer of the style of Benedetto Castiglione, from whose pictures he studied a considerable time. This statement is followed by M. Pérès in the 'Biographie Universelle,' though the same work gives the date of Castiglione's birth as 1616. Mr. Bryan properly observes that the assertion of M. D'Argenville is not reconcileable with chronology, for the Flemish painter was thirty-seven years older than the Genoese; but how far he is justified in thence inferring that Sneyders did not leave the Netherlands is not so clear. During part of his career he lived at Brussels, having been invited there by the Archduke Albert, governor of the Low Countries, for whom he painted some of his finest works, particularly a stag-hunt, which was sent by the archduke to Philip III. of Spain, who was so charmed with the present, that he gave the artist commissions for several large pictures of huntings and other similar compositions, and which, down to a recent date, were in the old palace of Buen Retiro. Rubens, although himself eminent as an animal painter, held the abilities of Sneyders in such admiration that he frequently entrusted that portion of his pictures, as well as the fruit and other similar accessories, to the masterly pencil of [illegible] brother-artist, and it would be difficult to point out any two masters who have worked in conjunction whose performances are in more perfect harmony than those of these eminent men. Jordaens too availed himself of the talents of Sneyders in a similar manner, and in a variety of instances both Rubens and Jordaens conjointly executed the human figures in compositions of Sneyders, and there are known to be several pictures in existence the joint production of these three great but friendly rivals. The works of Sneyders are in many of the best collections in England. One in the possession of the Marquis of Westminster, in Grosvenor House, London, representing a Bear Hunt, consists of a group of two bears and eleven dogs. This picture is stated, in Mr. Young's Catalogue of that collection, to have been painted for a noble family in Venice, and to have been sent to England about seventy years ago and purchased by the late Lord Grosvenor. M. Pérès enumerates nine pictures by this master as being in the museum of the Louvre, one of which contains the [illegible] lions afterwards introduced by Rubens into his picture of the Marriage of Henry IV. Although the works of Sneyders consist principally of boar and bear hunts, and [illegible] compositions of animals, views of interiors and subjects of still-life are by no means uncommon, though it is reasonable to suppose that the chief number of these were executed soon after he had left the studio of Van Balen. Those however in which the human figures are painted by Rubens or Jordaens are of course of a later date. There is an admirable portrait of Sneyders by Vandyke, which was in the Orleans collection, and is engraved in the well-known series of heads after pictures by that master. There are, according to Mr. Bryan, a set of sixteen etchings of various animals by Sneyders, executed in a spirited and masterly manner. That there are a few etchings by him we know, but that they consist of so great a number as sixteen is very doubtful, for Bartsch in his catalogue does not mention even one as belonging to the extensive collection at Vienna, nor is there one by his hand among the prints formerly belonging to Mr. Sheepshanks, and now deposited in the British Museum, a collection confessedly rich in works, both with the graver and the point, by masters in the Flemish and Dutch schools. Although there are very few etchings by this eminent painter, there are many after his works. He died at Antwerp, in the year 1[illegible].

(*Biographie Universelle*; Bryan's and Pilkington's *Dictionaries*.)

SNIPE, the English name for those grallatorial [illegible] which belong to the second section of the Scolopacidæ [vol. xxi., p. 85], and form the genus *Gallinago*, Steph.

The Snipes most familiar to the English sportsman and ornithologist are the Common Snipe, the Jack Snipe, and the Solitary Snipe: Sabine's Snipe (*Scolopax Sabini*) is of very rare occurrence, and indeed the Solitary Snipe is far from common.

We proceed to illustrate this section by descriptions and figures of the Common Snipe and the Solitary or Great Snipe.

And first of the Common Snipe, *Scolopax Gallinago*, Linn., *Gallinago scolopacinus*, Bonap.

Description.—Normal number of tail-feathers fourteen, varying to sixteen (Brehm's Snipe), and twelve (De la[illegible] Snipe). Upper parts variegated very nearly as in the Solitary Snipe; neck and breast striped longitudinally, [illegible] striped transversely with white and blackish; middle [illegible] belly and abdomen spotless, pure white; base of the [illegible] ash-colour, the rest brown; feet pale-greenish; length about ten inches and a half, of which the bill measures about two inches and three-quarters.

The colours of the plumage, after the spring moult, are brighter and more brilliant with bronze reflections than after the autumnal moult: in winter the hue becomes more ashy.

Varieties.—Pure white; reddish-white; the feathers sprinkled or blotched with white, or some part of the plumage white.

This is the *Beccacino* and *Pizzarda* of the Italians; *Bécassine* or *Bécasseau* and *Chèvre volant* of the French; *Heer Schnepfe* and *Himels Ziege* of the Dutch; *Watersnep* of the Netherlanders; *Myr Snippe* of the Icelanders; *Horsgjok* of the Swedes; *Hossegioeg* of the Danes; and *Ysnitian y Fyniar* of the antient British.*

Geographical Distribution.—Mr. Gould (*Birds of Europe*) states, that, although the contrary has been long stated by naturalists, he conceives that the natural range of the Common Snipe is comparatively limited, and that the Snipes from India, Africa, and North America, which have been regarded as identical with our bird, will be found, on examination, to be specifically distinct; in the character of their plumage, he observes, they are indeed somewhat similar, but they nearly all present a different form in the feathers of the tail, and also a difference of number. The Prince of Musignano had, in his *Specchio Comparativo*, marked the North American bird with a ?, as identical with that found near Rome; and in his *Birds of Europe and North America*, the same identity is recorded, and the ? is withdrawn. Temminck says that an individual received by him from North America differs solely from those killed in Europe in the colours of the plumage, which are some shades brighter. He also states that the common snipe occurs 'jusqu'au Japon,' where, he remarks, the species is exactly the same, and has always fourteen feathers in the tail. Mr. Strickland notes it as abundant in Smyrna. It is said to be found in Lower Egypt.

The following localities have been given as the range of the common snipe in Europe and Asia:—Russia and Siberia, from Scona to Lapland, Norway, Sweden, Denmark, Faroe Islands, Iceland and Greenland, Germany, Holland, British Islands, France, Spain, Provence, Switzerland, Italy, Hungary, and Illyria.

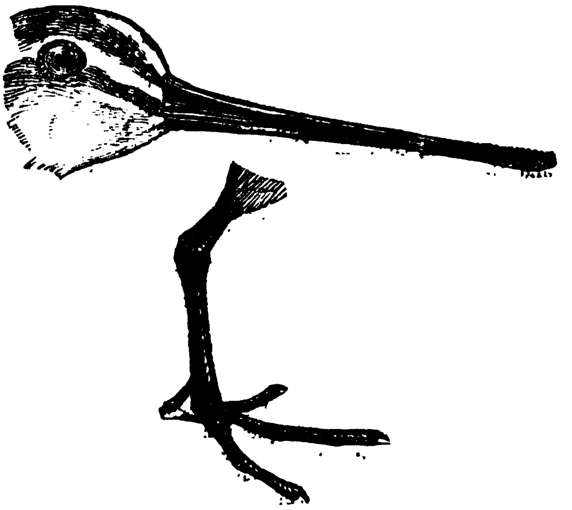
Food, Habits, Nest, &c.—Marshes, moist meadows, and, in frosty weather, the edges of rushy rills, are the haunts of the snipe. In such situations they have been seen pushing their bills, by means of repeated thrusts, quite up to the base in the mud, drawing them back with great quickness, and shifting their ground every now and then. Their food consists of such worms, insects, and small mollusks as haunt such miry places, and they have been shot in the act of feeding on leeches.

The bill of a fresh snipe presents above, at the end, and for some way up, a dimpled appearance, somewhat resembling the depressions on a woman's thimble: these little cells, which are continued into the bones of the upper mandible, are supplied by portions from two branches of the fifth pair of nerves. Thus this sensitive probe enables the bird to ascertain the presence of its prey, and to capture it securely, though hidden from its sight. The nest, which is rude and inartificial, being a mere depression in the ground under or upon a tuft of grass or rushes, scantily lined with dry grass or herbage, has been found among long grass by the side of small lochs, amid the long heather on the sides of hills, and in fens among rushes. The eggs, generally four in number, are pale-yellowish or greenish-white, with rather elongated spots of two or three shades of brown on the big end. They are large, being about one inch six lines in length, and one inch one line in breadth. Sir Humphry Davy, who came upon the nests of ten or twelve couple, in the heather surrounding a small lake in the island of Hoy in the Orkneys, where he was grouse-shooting in August, 1817, found usually two young ones in a nest, though he had seen three. He describes the parent birds as being exceedingly attached to their young, and says that if any one approach their nest, they make a loud and drumming noise above the head of the intruder, as if to divert his attention. In the British Islands they have been known to breed also in Dorsetshire, in the New Forest, in Cambridgeshire, in Norfolk, in Scotland, in Wales (on a marshy hill in the neighbourhood of Coytrahên, near Bridgend in Glamorganshire), and in Ireland. Mr. Selby observes, that, in addition to our native snipes, great flights come annually from Norway and other northern parts of Europe; and that in Northumberland they arrive in the greatest numbers in the beginning of November. He remarks what most snipe-shooters have noticed, that they seldom remain long in one situation, but move from place to place; so that the sportsman who has enjoyed excellent snipe-shooting one day, may find the same spots entirely deserted on the following. 'Towards the end of March or beginning of April,' says Mr. Selby in continuation, 'snipes, having perfected their summer or nuptial plumage, select appropriate places for nidification, and the male bird commences his calls of invitation for a mate. These are always uttered upon the wing, and consist of a piping or clicking note, often repeated, and accompanied at intervals by a humming or bleating noise, not unlike that of a goat,' whence probably its French names of *Chèvre volant* and *Chèvrette volante*, 'apparently produced by the action of the wings, as the bird, whenever this sound is emitted, is observed to descend with great velocity, and with a trembling motion of the pinions. At this season it soars to an immense height, remaining long upon the wing; and its notes may frequently be heard when the bird itself is far beyond the reach of sight. These flights are performed at intervals during the day, but more commonly towards the evening, and are continued during the whole time that the female is engaged in incubation.'

Utility to Man.—Few birds are better than a *fresh* snipe. The old quatrain says—

> 'Le becasseau est de fort bon manger,
>   Duquel la chair resueille l'appetit.
> Il est oyseau passager et petit:
>   Et par son goust fait des vins bien juger.'

'Snypes' were among the birds admitted to the earl of Northumberland's table (*Houshold*, 1512), and were then charged at 3*d*. a dozen.



Head and Foot of the Common Snipe.

The *Solitary, Double*, or *Great Snipe, Scolopax major* (*Gallinago major*, Bonap.), is a much larger bird.

Description.—Tail composed of sixteen feathers; mid-rib of the first quill whitish. The black of the top of the head divided by a band of yellowish white; eyebrows of that colour; upper parts variegated with black and bright rusty, the last-named colour disposed longitudinally; lower parts whitish rusty; belly and sides striped with black bands; bill inclining to reddish, brown at the point; feet greenish ash. (Temm.)

Mr. Yarrell gives a much more elaborate description, and as it is very correct, and the bird is not common, we here lay it before our readers:—

'The beak dark-brown at the end, pale yellow-brown at the base; irides dark-brown; from the base of the beak to the eye, a dark-brown streak; over that, over the eye and the ear-coverts, a streak of pale-brown; forehead and top of the head rich dark-brown, divided along the middle line from before backwards by a pale-brown stripe; neck all round pale-brown, the centre of each feather darker brown; interscapulars, scapulars, and back, rich brownish-black, with central lines and broad margins of rich buff or fawn colour; lesser wing-coverts nearly black, the upper series tipped with pale-brown, the lower series tipped with white; great coverts black, tipped with white; primary quill-feathers dull greyish-black, with white shafts; secondaries dull black, tipped with white; tertials black, barred and streaked with pale brown; rump very dark-brown, edged with pale brown; upper tail-coverts pale yellow-brown, varied with dark-brown; tail-feathers sixteen, the four on each outside nearly all white, the others rich brownish-black over three-fourths of their length from the base, then a patch of chestnut, bounded by a circle of black, and tipped with white; chin pale yellow-brown; breast and sides of the body with half-circular bands of brownish-black on pale-brown; belly and vent pale brownish-white; legs and toes greenish-brown; the claws black. The legs and toes are subject to some variation in colour. I have seen them in fresh-killed birds of a livid-green, and even of a light-drab colour. The whole length about twelve inches. From the carpal joint to the end of the first quill-feather, which is the longest in the wing, five inches and a half. The weight from seven to nine ounces, depending on age and sex. The females larger than the males. The males are lighter in colour above and below the dark stripe behind the base of the beak, like the woodcock; and the breast is less covered with the dark half-circular markings: the white spots at the ends of the wing-coverts are rather larger, and more conspicuous from their purer white colour. Young birds in their first autumn have short beaks, and fewer, if any, white outside tail-feathers; these are probably obtained at their first moult, as this species is sometimes described as being without any white outer tail-feathers, and at others with as many as five on each outside.'

---

* *Giach* is the antient British name for the Jack Snipe.

This is the *Grande* or *Double Bécassine* of the French; *Beccacino maggiore, Pizzardone*, and *Croccolone* of the Italians; *Mittelschnepfe* and *Doppelschnepfe* of the Germans; *Pœlsnep* of the Netherlanders; *Great Snipe, Double Snipe*, and *Solitary Snipe* of the modern British; and *Ysnid* of the antient British.

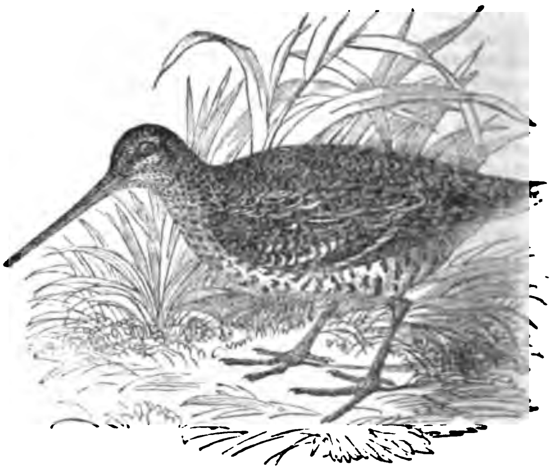
Geographical Distribution.—Head-quarters, the north of Europe. Norway, where specimens transmitted to the Zoological Society of London were shot by Sir Humphry Davy, Sweden, Germany, Holland, France, Italy, Switzerland, the borders of Asia, Trebizond, the neighbourhood of the Caucasus.

In the British Islands the bird has been killed in Lancashire (the specimen from which Pennant first described it, and which was preserved in the Leverian Museum), and has been noticed as not uncommon in Norfolk. Mr. Yarrell says, 'Their course, both in the spring and autumn (at which period they have been generally shot in this country), is considered by Mr. Selby to be generally to the east of the longitude of the British Islands; and I may mention, in corroboration of this view, that I am not aware of more than one record of the occurrence of this species in Ireland, and in England they are most frequent in the eastern counties.' From the Welsh name above noticed, it is plain that the bird has been not unfrequently observed in the principality, though published instances of its occurrence in that locality do not appear to be known. Whilst we write (late in September, 1841) a friend has sent us a fine specimen, killed on the marshy hill near Coytrahên, above alluded to. It was flushed from a dry hedge-row (the boundary to a wet field), into which it had been marked by the keeper, and was shot by our friend's companion. The bird uttered no cry in rising, and its flight was very heavy, more like that of a woodcock than a snipe. Several common snipes were found in the field, one not more than fifty yards from the place where the solitary snipe was put up. The keeper stated that the latter kept in a perfectly dry part of the hill, not near any other birds: and it was considered probable that it had been there all the summer, as it was in good condition, and no foreigners of the common kind had yet arrived in the low grounds, where they are very numerous late in the year. But it should be remembered that the bird was killed at a period when it most commonly occurs as a visiter to this country.

Food, Habits, Nidification, &c.—Sir Humphry Davy, who notices the fact of this snipe's breeding in the great royal decoy or marsh-preserve near Hanover, says that they require solitude and perfect quiet, and that, their food being peculiar, they require a great extent of marshy meadow. They feed on the larvæ of *Tipulæ* (commonly called Father Long-legs), or congenerous flies; and their stomach, the same author tells us, is the thinnest among the *Scolopax* tribe. Mr. Lloyd always found this bird singly, or at most in pairs, near Gothenburg, where they were by no means plentiful, and he states that they are so fat in the autumn, as apparently to be hardly able to fly; indeed, he remarks that, if flushed, they usually proceed but a short distance before they settle again. Their flight, he adds, is heavy and steady, and they present the easiest mark possible. The same sporting traveller quotes Mr. Greiff ('Förste Hof-Jagmästare'), who remarks that this species is a bird of passage, and amongst those which arrive the latest; and that at the end of July, when the meadows are mowed, shooting them commences and continues till towards the end of September. The pointer is the dog selected to accompany the sportsman, and Mr. Greiff speaks of the sport with rapture. 'The birds,' he says, 'are easy to shoot, and in some places fifty or sixty, aye, considerably more, may be killed in a day, particularly in autumn, when they are so fat that they almost burst their skins. They are most delicious eating.' Mr. Greiff adds, that he was already an old sportsman of thirty years' standing before it came to his knowledge that these double snipes had their *lek* or playing-ground. [CAPERCAILIE, vol. vi., pp. 262, 263.] He heard their cry a whole spring in a marsh where he had a good *Orr-lek*,* but never observed them, and therefore believed that the sound came from some frogs or reptiles; but at last he discovered that the cry was uttered by double snipes which ran like rats among the hillocks. This cry, according to Mr. Greiff, commences with a sound resembling the smack of the tongue, and thereupon four or five louder smacks follow.

The rude nest of the double snipe, which is very like that of the common snipe, is generally placed on a hummock or tuft of grass, or a bunch of rushes on the borders of a swamp, often near willow bushes. Eggs three or four in number, yellowish olive-brown, with great spots of reddish-brown; length, one inch nine lines; breadth, one inch two lines.

They breed in considerable numbers in the mountainous parts of Norway and Sweden, as high as the range of birch-woods extend. In the Dofre Fi-ell at Jerkin and Fogstuen, they are numerous on the edges of the grassy swamps, avoiding the wet. They also frequently resort to the borders of the small rills used for irrigating the grass-land. During the pairing season they fly to a vast height. They make a drumming noise as they descend, which is produced by a slight and peculiar vibration of the wings. (Yarrell, ex relatione Dann.) Mr. Gould observes that there are two other snipes which exceed this in size, found in the hilly districts of India, and a third from Mexico, whose size is superior to that of a woodcock. (*Birds of Europe.*)



Solitary or Double Snipe.

SNORRI STURLUSON, also called *Sturleson* or *Sturlason*, and in Latin works *Snorro*, was the son of Sturla, and born in Iceland in the year 1178, on an estate belonging to his father, called Hoamms, whence the father is sometimes called Hoamms-Sturla. When Snorri had scarcely attained his fourth year, his father died, and he was thenceforth educated at Odi, in the house of Ion, the most learned man of the age. His education was conducted with great care, and his talents soon gave him distinction as a philosopher, a mathematician, a lawyer, a linguist, antiquary, and architect. At the same time he acquired a great reputation for the enchanting manner in which he told the stories of former times, an art which is still highly valued in Iceland. Although his father had been the chieftain of an Icelandic tribe, the son appears to have been poor, until he improved his circumstances by a marriage with a wealthy lady, whom some years afterwards however he deserted. He managed his newly-acquired property self that he became no less distinguished for his wealth than for his talents and learning. He was several times invested with the office of Lawsögumadr, that is, interpreter of the law, the highest official dignity in Iceland, and gradually rose to the rank of Landir-madr and of Yarl, which was the highest title next to that of duke. During the period of his greatest prosperity he composed some of the most beautiful songs (also sagas) that exist in the literature of Iceland, and also wrote some historical works. He also spent considerable sums upon the building of splendid houses, especially at Reykiaholt. His character as a man however was by no means in accordance with his great mental powers, for he was avaricious, quarrelsome, inconstant, and full of cunning, though wanting in active energy. A party was formed against him, which was headed by his own brother Sighvat and his nephew Sturla; and his enemies were enraged at Snorri having abandoned his wife, joined his enemies. Snorri and his adherents were defeated and banished from the island (1234). They went over to Norway, where Snorri's patron, Duke Skuli, was preparing a revolt against King Hacon, and was supported by the political powers of Snorri. In the meanwhile however his enemies in Iceland were defeated and Snorri, dreading the vengeance of King Hacon, returned to his native island, but the king declared him an outlaw, and Snorri was murdered on the 22nd of September, 1241, at Reykiaholt, by his own son-in-law.

---

* *Orre* is the Swedish name for the BLACK COCK.

Snorri is one of the greatest, and at the same time the last of the northern Skalds. His most important work is the 'Heimskringla,' a historical collection of sagas, consisting partly of Skaldic songs by Snorri himself, and partly of the poems of earlier Skalds, who were contemporary with the events which they describe, and whose poems are interwoven in the Sagas of Snorri himself. This collection was first published by Peringskiöld (Stockholm, 1697, fol.), with a Swedish and Danish translation; another edition, with a Danish and Latin translation, appeared at Copenhagen from 1777 till 1826. Vols. 1 and 2 were edited by Schöning; vol. 3 by Sk. Th. Thorlacius; vols. 4, 5, 6, with the separate title of 'Noregs Konunga Sögor,' by Birg. Thorlacius and E. Chr. Werlauff. The last Danish translation is that by Grundtvig, Copenhagen, 1818-1822, 3 vols. 4to. It has also been translated into German by Wachter, who has added a very valuable historical and critical introduction.

Among the other works ascribed to Snorri are, 1. 'The Gylfa-Ginning,' which forms the first part of the 'Snorra-Edda;' 2. 'The Scaldic Songs called Konungar or Skalda-tal;' 3. 'Hattatykill,' or the Key of the Wise, consisting of two eulogies on Duke Skuli, and three others which are partly written in praise of King Hacon. All these poems form part of the 'Skalda,' which has been edited by Rask (Stockholm, 1818), under the title of 'Snorra-Edda ásamt Skáldu.' Besides several other poems upon contemporary heroes, Snorri also wrote a number of Fraedi-bækr, or manuals of science, which have been very much used by his countrymen.

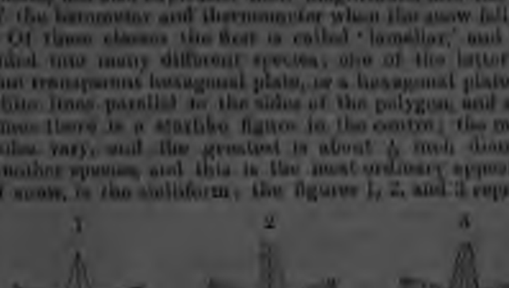
SNOW. It has been stated [RAIN, p. 265, vol. 1] that rain, snow, and hail are formed by the precipitation of vapour when two volumes of air of different temperatures, and saturated with moisture, become mixed together; the nature of the precipitation depending on the temperature of the region of the atmosphere through which the aqueous particles descend towards the ground. Now when the particles are frozen in separate crystals of ice, and these afterwards come together in such a manner as to reflect light to the eye in great abundance from all, thus producing a sensation of whiteness, the assemblage of crystals constitutes snow.

M. Monge observes (*Annales de Chimie*, vol. v., p. 1) that the crystallization of sal-ammoniac presents phenomena similar to those which are observed in the formation of snow. If a saturated solution of sal-ammoniac in a warm state be allowed to cool in a tranquil air, the surface of the liquid is that which first arrives at a state of supersaturation, and there the first crystals are formed; these sink immediately, and in descending they unite with similar crystals formed in the liquid itself, so that they arrive at the bottom of the vessel in white flakes. Thus also the elementary crystals, formed generally in the upper region of the atmosphere, gradually descend by their superior specific gravity, and by the laws of affinity cause the crystallization of the aqueous molecules which otherwise the air would have held in solution. Thus [illegible] there would probably arrive, if the atmosphere were tranquil and the temperature very low, small flakes of some regular figure. From such as have been observed, it appears that these consist of brilliant spicular needles, which diverge from a centre in six directions, and resemble stars having as many rays, upon each of which small crystals are sometimes formed; but if the atmosphere is agitated, the original flakes strike against each other, and uniting in groups, in consequence of small quantities of moisture adhering to them, they descend in irregular forms. In regions of the earth far to the north or south, the air, when allowed to enter through a small aperture into a heated apartment, has frequently caused the warm vapour to be converted into snow.

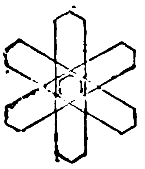
Snow has been observed to fall in a fine powder, not having any appearance of regular crystals; this is therefore supposed to have been formed near the surface of the earth, and is considered as being in an elementary state. (*Bibliothèque Universelle*, 1830.) The crystals are evidently those of ice combined together, and their primitive form is, from the experiments and observations of Sir David Brewster, considered as belonging to the pyramidal system. M. Hausmann infers this fact from the circumstance that hoar-frost and rime, which are of that class, produce crystallizations similar to the stellar figures of snow. The regularity of the formation of snow has been ascribed to electricity. Beccaria observed that his apparatus for ascertaining the electrical state of the atmosphere indicated the presence of the fluid in snow as well as in rain; and, according to the observations of Schübler, it is more commonly positive than negative. The lightness of the flakes, by which they float about in the air when agitated, is the result of their surface being great when compared with their volume. The specific gravity of snow is very variable; and according to Musschenbroek, that of snow, of the stelliform kind, was only $\frac{1}{24}$ of the specific gravity of water; but M. Quetelet has since found that the greatest density is nearly $\frac{1}{4\cdot8}$ of that of water, the temperature being 24·5° (Fahr.). He ascertained also that the density of fine snow having no determinate form was about $\frac{1}{4}$, the temperature being 31°, and that the least density varied from $\frac{1}{16}$ to $\frac{1}{9}$ of that of water, at which time the snow had the form of small stars, and the temperature varied from 29·7° to 18·5°.

The flakes of snow have even in temperate regions many varieties of form, and are often very elegant; but the polar regions of the earth are those in which nature has displayed her power in creating this species of beauty in the highest degree and to the greatest extent. In the *Phil. Trans.*, 1775, may be seen numerous delineations of the figures assumed by flakes of snow as they were observed by Dr. Nettis of Middelburg in 1740; but Mr. Scoresby, in his 'Account of the Arctic Regions,' has given still greater varieties, the latter gentleman, besides dividing them into classes, has also expressed their magnitudes, and the state of the barometer and thermometer when the snow fell.

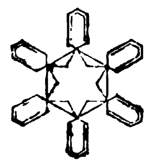
Of these classes the first is called 'lamellar,' and is divided into many different species; one of the latter is a thin transparent hexagonal plate, or a hexagonal plate with white lines parallel to the sides of the polygon, and sometimes there is a starlike figure in the centre; the magnitudes vary, and the greatest is about [illegible] inch diameter. Another species, and this is the most ordinary appearance of snow, is the stelliform; the figures 1, 2, and 3 represent the most remarkable varieties of this kind; its magnitude varies, but the diameter of the greatest is about $\frac{1}{3}$ inch, and it occurs most abundantly when the temperature of the air is near the freezing-point of water. Sometimes the stars appear to have twelve points, but Mr. Scoresby thinks that these are formed merely of two stellar plates applied one on the other. The six following figures represent assemblages of hexagonal crystals; the diameters of the two first kinds are respectively [illegible] and [illegible] inch, and those of the rest are [illegible] inch diameter; they are usually formed at temperatures between 22° and 20° (Fahr.).



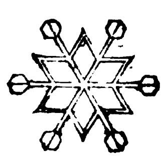
4



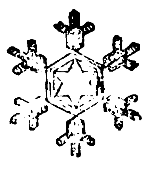
5



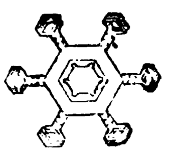
6



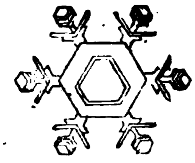
7



8



9



The second class is also lamellar, but it differs from the former in having a spherical nucleus, either transparent or white, about $\frac{1}{4}$ inch diameter; and sometimes spicular radii proceed from thence in different directions at angles of 60° with each other. The temperature at which this class is formed varies also from the freezing-point to 20° (Fahr.)

The third class consists of spiculæ, or six-sided prisms; of these, the finer sort, which are formed at the temperature of 28°, resemble white hairs very delicate and clear, and about $\frac{1}{4}$ inch long; the coarser kinds are formed in the lower region of the atmosphere, at about the freezing temperature.

The fourth class is of a pyramidal form and about $\frac{1}{30}$ inch high, but Mr. Scoresby could not determine whether the base was triangular or hexagonal. The fifth class consists of hexagonal crystals united together by a slender spicular crystal, so as to resemble two wheels with an axle. Both of these kinds are very rare. Mr. Scoresby saw the latter only twice and the former only once.

M. Huber Burnand, speaking of the character of the snow which fell at Yverdun in 1829 and 1830, states that it was crystallized in stellar plates with six rays, along each of which were disposed filaments arranged like feathers, and these again supported finer filaments similarly arranged; the plates, which were extremely thin, were perfectly plane and regular. (*Bibl. Univ.*, 1830.) It is also related in the same work, that in 1829 the frost at Yverdun assumed every day a different form, being sometimes disposed in parallel groups or fillets; sometimes it resembled leaves, and occasionally spines about an inch long, which were terminated by a flat rosette with six divisions.

Snow in the form of cylinders and spheres or spheroids has been occasionally observed in North America. The former were produced by the snow deposited in a second shower upon some which had previously fallen, and the surface of which had been covered by a thin coating of ice. A violent wind then caused the particles of snow to roll on the ice, and the masses thus produced assumed perfectly cylindrical forms of various sizes, the greatest being 2½ or 3 feet diameter; they were hollow at each end. The spherical balls were from 1 inch to 15 inches in diameter, and were also formed chiefly by rolling, though some were found in enclosures where they could not have rolled, and therefore they are supposed to have been formed in the atmosphere itself; they were very light, and were composed of crystals irregularly united. (Silliman's *Journal*, vols. ii. and vi.) Similar balls were observed in East Lothian, in 1830, by Mr. Sheriff; and this gentleman relates that they were composed only of snow, for one of them being cut through, was found to have no hard body for its nucleus. (*Edin. Phil. Journal*, ii. 58.)

That animalculæ exist in snow is evident from an observation stated in Silliman's *Journal* (vol. xviii.). We learn there that Dr. Mure having first examined some water in a glass by means of a microscope, and found it quite pure, put into the water a quantity of snow; he then found that, on solution, the water exhibited in full activity hundreds of animalcules, which, when viewed through the microscope, resembled very diminutive shrimps, and were quite unlike the eels discovered in acetous acid. It may be observed here, that snow-water, being drunk, is considered as unfavourable to the human constitution; the affections of the throat, to which the people in some parts of Switzerland are subject, are thought to be caused by its deleterious qualities.

The formation of hail is probably a result of the abstraction of caloric from the molecules of vapour in the atmosphere, by the agency of electricity or otherwise. Volta supposes that the hail, when once formed, may continue to acquire new accessions of frozen vapour, till the weight of the stones becomes sufficient to overcome the electrical attractions by which they are kept suspended; and thus the existence of very large hailstones may be accounted for. The violence with which they rush in a direction nearly parallel to the horizon when no wind is stirring, is ascribed by the same philosopher to a combination of the force of gravity with that which arises from the shock of two electrical clouds, by which the hail may be produced. The hypothesis of the formation of hail by the collision of electric clouds has however been objected to by M. Arago; and the theory of Hutton respecting the formation of rain [Rain] is considered capable of accounting also for the phenomena both of snow and hail. The loss of heat in the descending molecules being greater when hailstones are formed than when the vapour is brought to the state of rain or snow. This hypothesis appears to be confirmed by the fact that the same cloud has produced both rain and hail.

Hailstorms often extend to great distances in one direction, while they are of very limited breadth. That which created so much destruction in France, in July, 1788, passed in two parallel lines over that country from south-west to north-east, one line being in length about 175, and the other about 200 leagues, while the mean breadth of each was only about 3 leagues; and in the interval between them, which was about 5 leagues, the country was deluged with heavy rains. The hailstorm which, in the month of May, in the present year (1841), visited this country, spent all its fury between Bagshot and Reading, within which tract immense damage was sustained.

Hoar-frost is only dew frozen immediately upon being formed. [Dew.]

SNOW, RED. The occasional occurrence of snow coloured red has for a long time created great interest, especially as the labours of the most eminent naturalists have not yet been able to determine precisely to what causes this singular phenomenon owes its origin. The chemist, the botanist, and the zoologist have in turn examined this extraordinary substance, and each has not failed to trace its source to objects belonging to his particular department of study.

It appears that this phenomenon did not escape the observant eye of Aristotle, and he mentions that living beings found in old snow had frequently a reddish colour, which supposed they derived from the snow. (*Hist. Anim.*, v. cap. 19.) This observation of Aristotle's however does not appear to have excited any attention, and no other writer mentioned the occurrence of red snow till 1760, when Saussure discovered it on the Brevent and other mountains, but more especially on the Saint Bernard, where it exists in great abundance. He made some chemical analyses of this snow, and came to the conclusion that it was of vegetable origin, and probably consisted of grains of pollen mixed with the snow, such a cause having been known to discolour rain, producing what was called a *sulphur shower*. (De Sauss., *Voy.*, ii., p. 646.)

It was not however till the year 1819, when our countryman Captain Ross returned from his arctic expedition, that this substance was accurately examined with a view to the discovery of the origin of its peculiar colour. Whilst in Baffin's Bay, 75° 54′ N. lat. and 67° 15′ W. long., Captain Ross discovered a range of cliffs covered with snow of a crimson colour. The cliffs were about 600 feet high, and were coloured for the extent of eight miles. According to Captain Ross, the party he sent on shore 'found that the snow was penetrated even down to the rock, in many places to a depth of twelve feet, by the colouring matter, and that it had the appearance of having been a long time in that state.'

The colouring matter of the snow, in the first instance, excited the attention of chemists, and was first analyzed by Peschier, an Italian chemist, and subsequently by Wollaston and Thénard. They all obtained nearly the same results. The following is Peschier's analysis:—

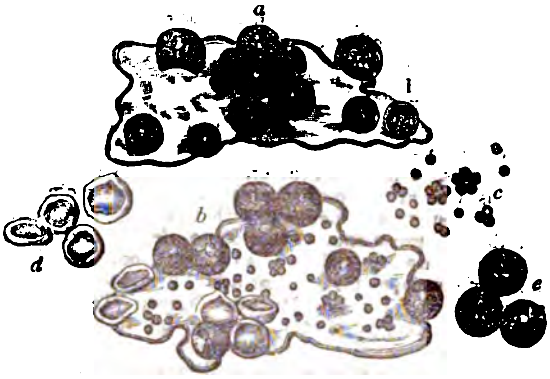
Siliceous matter . . .	65·5
Alumina	6·85
Peroxide of iron . .	21·35
Lime	1·17
Organic matter . . .	6·8
	100·0

But the labours of the chemist affording little that was satisfactory with regard to the nature of this substance, it was placed in the hands of the botanist, and in the Appendix to the account of Captain Ross's polar expedition, Mr. Robert Brown described the colouring-matter of the snow as a probable genus of the family of Algæ, and pointed out its resemblance to the *Fremella cruenta* of the English Botany. At the same time some of the red snow-water brought from Baffin's Bay was sent to Francis Bauer, who published the results of a very careful examination of it under the microscope, in the seventh volume of Brande's 'Journal of Science and Arts,' accompanied with several drawings. He found that the water contained a number of opaque or red spherical globules, which were heavier than the water, forming a sediment at the bottom of the bottle, and also of some transparent vesicular bodies which floated about in the fluid. On examining the red globules, he found them possessed of a pedicel resembling that of some species of *Uredo*, and regarded them as a species appertaining to this genus. He subsequently observed that many of the globules were attached to a gelatinous matrix presenting a cellular and articulated character. On exposing the water with the globules for some days to the air, he found that they lost their colour, and that on the sides of the vessel were developed new portions of the gelatinous matrix, which were covered with small globules, which he looked upon as young Uredos. He also found that on comparing the chemical analysis of the *Uredo fœtida* with that of the red snow, they in a great measure agreed, and hence he came to the conclusion that the colouring-matter of the red snow was a fungus belonging to the genus Uredo, and to which he gave the name *U. nivalis*.

But the question was not thus set at rest. In 1823 Baron Wrangel gave an account of a plant of a red colour, which he called *Lepraria Kermesina*, and supposed to be identical with the long-disputed *Byssus Iolithus* of Linnæus. This plant was obtained from the surface of white limestone rocks, forming over them a thin red crust, and was also found contained in the rain water remaining on the limestone. During the same year Professor Agardh of Lund, who had previously suggested the identity of this plant and that of red snow, received specimens of the Lepraria from Baron Wrangel, and also of the *Uredo nivalis* of Bauer from England, and he came to the conclusion, after a very minute examination, 'that the two plants were actually one and the same species.' 'We must conclude,' says Agardh (Greville's *Scottish Cryptog. Flora*, 'Protococcus,' p. 15), 'that the *Uredo nivalis* and the *Lepraria Kermesina* are alike called into existence by the gradual melting of the snow, and the intensity of light in their relative situations; and that they are neither washed down from the rocks, as some persons believe, nor are precipitated from the atmosphere, as might be inferred from the accounts transmitted by the Italians.'

The plants which Agardh had thus identified, he could not consider, with Bauer, a fungus, or, with Wrangel, a lichen, but, from its analogy to some of the Algæ, he placed it in his *Systema Algarum*, in that family under the name of *Protococcus nivalis*.

In 1825 the subject was taken up by Dr. Greville of Edinburgh. He had received specimens of the plant of red snow from the polar regions, and also from the island of Lismore in Scotland. From this latter situation it was sent to Dr. Greville by Captain Carmichael, who says:—'It occurs in abundance on the borders of the lakes of Lismore, spreading over the decayed reeds, leaves, &c. at the water's edge, but in greater perfection on the calcareous rocks within the reach of occasional inundation; and what is rather remarkable, it seems to thrive equally well whether immersed in water or exposed to the dry atmosphere. It is to be found more or less at all seasons of the year.' The specimens were immersed in water, and then examined by the microscope. In every instance Dr. Greville observed a gelatinous substratum varying in thickness, colourless, diffuse, without any border. Upon this gelatine rested a vast number of minute globules, the colour of fine garnets, exactly spherical, nearly opaque, yet very brilliant, and nearly equal in size. In the full-sized globules granules were detected in the interior, which gave to the surface a reticulated appearance. When mature, they burst, and the granules escaped, to the number of six, eight, or more, and the membrane only of the globule was left behind, buoyant and colourless. The globules or granules were never observed to move. Dr. Greville at first doubted the propriety of referring his plant to Agardh's genus Protococcus, as in his definition Agardh had not mentioned any gelatinous substratum, which was so evident in his own specimens. He however determined on keeping up the genus with an amended character. Agardh's definition of Protococcus is merely, 'plants with aggregated, not mucous globules.' To this Greville added, 'globules containing granules seated on a transparent gelatinous mass.'



Protococcus nivalis, Grev.: Glœococcus nivalis, Shut.: *a*, mature globules mixed with younger ones (1) lying on a mass of gelatine. *b*, mature globules: some burst, with granules lying on the gelatine. *c*, granules. *d*, globules after discharging their granules. *e*, full-sized globules.

In the same year Sir William Hooker, in the 'Appendix to Parry's Second Voyage to the Arctic Regions,' described, under the name of *Palmella nivalis*, the plant of the red snow collected in that expedition. Sir William Hooker referred the plant to this genus, as it only differed in its globules being seated on a gelatinous mass, instead of being immersed in it.

From this time to 1838 a variety of memoirs and observations upon the red snow were published, chiefly on the Continent, by Kunze, Unger, Martius, and other observers, but no new matter of any importance was elicited.

We now come to another and very important point in the history of red snow. Hitherto all the examinations had been made on old specimens of the red snow, most of them removed at a great distance from the spots on which they were originally found. In August, 1839, Mr. Shuttleworth, an English gentleman resident in Switzerland, being at Grimsel, understood that there was red snow in the neighbourhood, and having a microscope with him, made observations on the recently procured snow. Having melted the snow and placed some of the red matter on the field of the microscope, he was surprised at finding, instead of the immoveable globules of an Alga, an immense number of exceedingly active animalculæ, not of one form only, but of various sizes and forms. The results of this examination he has given in an interesting paper accompanied with drawings, in the 'Bibliothèque Universelle de Génève' for February, 1840. The following are the forms of Infusoria, which he was enabled to detect:—1. An animalcule belonging to Ehrenberg's genus *Astasia*, which he called *A. nivalis*. 2. An animalcule, red inside, with a transparent carapace, belonging to the genus *Gyges*, *G. sanguineus*, Sh. 3. One much smaller than the other two, moving, but resembling the globules of Protococcus. 4. One belonging to the genus Volvox. Several other uncoloured species were found, but they were considered accidental. In addition to the animalcules, Mr. Shuttleworth found bodies which he took to be true plants, and referred to the *Protococcus nivalis* of Agardh and the *P. nebulosus* of Kützing.

In 1840 Professor Agassiz of Neufchâtel made a visit to the glacier of Aar, where, having taken with him a microscope, he had several opportunities of examining the red snow, and communicated a paper on this subject to the meeting of the British Association at Glasgow in the same year. He confirmed the researches of Shuttleworth, having found all the animalcules mentioned by him, and added four others to the list. Three of these are comparatively unimportant, but to the fourth great interest attaches, as he supposes that the ova of this animal are the globules which have been taken for a plant, and called Protococcus, &c. This animalcule is the *Philodina roseola* of Ehrenberg. It was found abundantly in the lower glacier of the Aar. It has a much higher organization than the other animalcules, and contains in its inside a number of red globules, which may be distinctly seen through its transparent body. These globules are its ova, which, on being deposited, precisely resemble the globules of Protococcus as figured by Shuttleworth and others.

In the various papers referred to above, no mention is made of snow of any other colour than red. Martius however, a naturalist who accompanied the French expedition to Spitzbergen, mentions having found in one instance a field of green snow. It was accompanied however with the Protococcus, giving a red colour. From many observations Martius arrived at the conclusion that the red globules of the green snow are identical with those of the red snow, and that the green snow (*Protococcus viridis*) and the red (*P. nivalis*) are one and the same plant, only in different stages of development, but that it is difficult to state which is the original. The late Professor Meyen (Taylor's *Ann. Nat. Hist.*, August, 1841) remarks on this statement, that these Protococci are not plants, but animals, the *Euglena sanguinea* and *E. viridis* of Ehrenberg. The reason of their being so often taken for plants is, that they naturally pass a great portion of their existence in a passive state, only occasionally under favourable circumstances starting into activity. When they do this, their spherical form is changed, and they become the elongated beings described and figured by Ehrenberg.

From this sketch of our present knowledge on this subject, it will be found that a wide field still remains open for observation, which will have for its object not so much the determining the nature of the colouring-matter of the red snow, as the ascertaining the laws that regulate organic life in its simpliest forms.

SNOWDON. [CAERNARVONSHIRE.]

SNUFF. [TOBACCO.]

SNYDERS. [SNEYDERS.]

SOANE, SIR JOHN, was a remarkable instance of a career commenced in poverty and obscurity, and terminating in opulence and celebrity. Of his origin little is known, except that his father was a bricklayer or petty builder, and he himself born at Reading, September 10th, 1753. At an early age he was taken into the office of Dance, the architect (in whose family his sister was also a servant), first merely as errand-boy or attendant, but afterwards he was placed on the footing of a pupil. He subsequently entered that of Holland, another eminent architect, where he remained up to the time of his being sent to Italy for three years as travelling student of the Royal Academy, at the recommendation of Sir W. Chambers, in consequence of the talent displayed by him in a design for a triumphal bridge, which obtained the gold medal. It was perhaps a fortunate circumstance for him that an octavo volume of designs for temples, baths, &c., previously prepared by him, was not published till 1778, the year after he quitted England, since, so far from displaying any talent, it indicates the most wretched taste. No wonder, then, that at a later period the author should have bought up every copy he could meet with, more especially as his name is there printed *Soan*, which name itself, we have been assured upon excellent authority, was an improvement upon the original one of Swan. These designs exhibit the germs of many of his after peculiarities—of those whims and freaks, together with that littleness of manner, from which he could never totally divest himself even in his best works.

During his stay in Italy (1777-1780) he made good use of his time, studying antient buildings, particularly those arrangements of plan and picturesque combinations which occur in Roman Thermæ, or imperial baths. He also made original designs, among which were those for a British Senate House and Royal Palace. While in Italy he became acquainted with Mr. Thomas Pitt, afterwards Lord Camelford, to whose influence he is said to have been mainly indebted for his appointment as architect of the Bank of England, on the death of Sir Robert Taylor. Very soon after his return to England, he executed several private residences and country-seats in the counties of Norfolk, Suffolk, &c., the plans and elevations of which he published in a folio volume, 1788; but except that there are some good points in the former, and that they manifest great attention to convenience, they display very little invention or taste. On obtaining the lucrative appointment to the Bank, he married Miss Smith, the niece of Mr. George Wyatt, a wealthy builder in the city, whose death soon put him into possession of a very considerable fortune in right of his wife. Other advantageous appointments followed: that of clerk of the works to St. James's Palace, 1791; of architect to the Woods and Forests, 1795; and of surveyor to Chelsea Hospital, 1807; besides that of professor of architecture at the Royal Academy in 1806. Numerous commissions for both public and private buildings, in addition to his official engagements, kept him in constant occupation for many years; and some of them furnished him with more favourable opportunities than were afforded to almost any other architect of that day. Yet notwithstanding his undeniable attachment to his profession, and his industrious application to it, the majority of the buildings that he executed are little better than so many experimental attempts at originality, with considerable merits in parts, but more or less failures upon the whole. With all his apparent fertility of invention, they exhibit sameness of ideas, and those by no means of the happiest kind; while, with a good deal of study in some respects they betray great neglect of it in others. Never was architect more unequal in his taste, not only at different times but in the same building, for not a single building among all that he executed or designed is consistently finished throughout. On the contrary, striking beauties and striking defects are so oddly mixed up in several of them, that it is hardly possible to say which predominate. Even in minor designs, where he was at liberty to exercise his fancy without restraint, there invariably occurs something more offensively mean or extravagantly uncouth and absurd. Proofs of this assertion are furnished by the folio of 'Public and Private Buildings,' published by him in 1828, and which was intended to be in some measure a record of his long professional career, although the plates are wretchedly executed; and nearly the same may be said of those in the 'Description' of his own house and museum, a quarto volume of some bulk, printed by him in 1832 for private distribution and presents. In both instances he was most niggardly towards himself, yet in the latter not altogether free at the same time from vanity. The same may be said with regard to the house itself, the exterior of which is by no means such a specimen of taste as an architect would be ambitious of bequeathing to posterity, though, taken altogether, the building and its contents form a monument sufficiently expressive of the character of the man—a strange jumble of magnificance and ostentation, of parsimony and extravagance, of ingenious contrivance in some parts, and of the most miserable conceits in others. Such as it is however, it was for years his favourite amusement, even from the time when he commenced it in 1812; and as he seems to have grudged no cost in making repeated alterations, it is singular, more especially considering the purpose to which he ultimately destined it, that he should not have rebuilt the front, and that of the house on each side of it (also his own property), so as to have produced a uniform façade of tolerably imposing aspect, even had he not added those houses to his own residence and museum.*

In 1833 he obtained an act of parliament vesting his museum, library, &c. in trustees, for the use of the public after his death. Availing himself of the power given by the act of parliament to make such regulations as he afterwards pleased, he thought proper to limit the time of the 'Soanean Museum' being opened to the public to two days in each week for three months in the year; when it can be visited only by tickets, and those are given in a very limited number for each day. On many occasions he indulged in ostentatious profusion, in donations to public bodies, &c., such as that of 1000*l.* to the fund for the Duke of York's monument, and similar sums to the British Institution, &c. Contrasted with his general economy—with the parsimony displayed in bringing out his own publications, it would indeed seem that such fits of expansive liberality were in some measure prompted by the desire of showing that it was not his love of money which prevented him from assisting his son, who had certainly some natural claims upon him. Whatever may have been the real cause, it is notorious that a most violent rupture had existed for years between Sir John and his only surviving son; nor could any reconciliation between them be effected—a circumstance which throws some light upon much that would otherwise be inexplicable in Sir John's character, including, among other points of it, his refusal of a baronetcy and his determination to accept only simple knighthood (1831). His alienation from his son induced many to believe forward to considerable legacies from him; but if he ever encouraged any such expectations, he certainly did not realise them. Advanced as he was in years, he had not fallen into dotage; both his faculties and health remained unimpaired to the last, when, with scarcely a day's previous indisposition, he died at his house in Lincoln's Inn Fields, January 20, 1837.

---

* An account of the building and its chief contents will be found in the 'Penny Magazine,' No. 263.

Eminently successful as he was throughout life, Sir J. Soane was quite as much to be pitied as to be envied, and he is a striking lesson to the world that prosperity may be bane to the man, and opportunity sometimes worse than wasted to the artist. As an architect, he did not, with the exception of the Bank—and there only in bits—accomplish anything of sterling merit. He had great ingenuity and contrivance, and was often singularly happy in those picturesque and perspective effects which depend upon arrangement and plan, and on the mode of admitting light [SKYLIGHT] in interiors; but he never fully wrought up his ideas, and often left them quite crude sketchings. His attempts at Gothic were almost beneath contempt. On the other hand, he is entitled to no small praise as being, if not the inventor of a new order, the first to apply and naturalise in this country the Tivoli Corinthian, employed by him at the Bank, the north-west corner of which structure so infinitely surpasses anything that he ever executed or designed, that his reputation would stand higher if that were all that he ever did.

SOAP. This term originally meant the compounds formed from the union between fatty bodies and the alkalis potash and soda; and although it is still usually thus limited in its meaning, it has nevertheless been extended to compounds of oleaginous bodies with some earthy and metallic bodies, having but few properties in common with soap properly so called.

It has been found by Chevreul that different varieties of fatty matter consist chiefly of two kinds; one hard, to which he gave the name of *stearin*; and the other soft, which he termed *elain*. He also discovered that stearin is composed of stearic acid and a peculiar principle which on account of its sweet taste he named *glycerin*; and it was further proved by his experiments that elain consists of oleic acid and glycerin; stearin is therefore a stearate of glycerin, and elain an oleate of the same substance.

When, in the manufacture of soap, an alkali (soda for example) is heated with tallow, the soda gradually dislodges the glycerin from combination with the stearic and oleic acids, and by combining with them forms soap, or in other words a compound of stearate and oleate of soda, and the glycerin remains in solution.

Glycerin was first noticed by Scheele, and is obtained in the greatest quantity and purity by saponifying olive-oil with oxide of lead mixed with a little water. This is the well-known process of preparing what is called diachylon or lead plaster, which is in fact a metallic soap, or a margarate and oleate of lead. The glycerin, which remains in combination with the water, is purified from oxide of lead by means of hydrosulphuric acid, and by cautious evaporation is obtained as a syrupy liquid of a decidedly sweet taste.

The principal kinds of soap manufactured in England are *white* or *curd soap*, made chiefly from tallow and soda; but for some particular purposes olive-oil and soda; *yellow soap*, composed of tallow, resin, and soda, to which some palm-oil is occasionally added; and *mottled soap*, made from tallow, kitchen-stuff, and soda; the mottled appearance is given to this soap by dispersing the lees through it towards the end of the operation. There is also a *brown soap*, made from palm-oil and resin. This oil contains *palmitic acid*.

Soft Soap is generally prepared from fish-oil and potash, and it may be here remarked that while hard soaps are prepared with the alkali soda, the alkali potash always enters into the composition of soft soaps. Besides the fatty matters mentioned, linseed oil and cocoa-nut oil are occasionally used. Until recently *barilla*, an impure carbonate of soda prepared chiefly in Spain, was employed in England, while kelp (or incinerated sea-weed) was and still is to a certain extent used in Scotland. These changes have been effected by abolishing the duty on common salt, from which a very pure carbonate of soda is now made, and when treated with lime its carbonic acid is removed, and being thus rendered caustic, the solution is used in the manufacture; it is to this improvement in the nature of the alkali now used, and its freedom from sulphur, that the nuisance of soap-lees waggons passing through London is got rid of.

The harder or soda soaps are prepared by boiling the fatty matter with an aqueous solution of caustic soda, that is, of carbonate of soda deprived of its carbonic acid by means of lime; when combination has taken place, or in other words when the soap is formed, a quantity of common salt is added, which, dissolving in the lees, increases their density, and the soap then floats on the surface of the liquid. The fire being then extinguished, the semifluid soap, *after a* proper interval, but while yet hot, is removed from the lees and put into frames of wood or iron, where it remains until it has become cold and hard, when it is cut into bars for sale. In making soft soap no lees are separated; the whole of the solution of potash, which is made strong on that account, being combined with the oily matter used.

In the opinion of Dr. Thomson, and according to his analysis, both white and yellow soda-soaps are subsalts consisting of one equivalent of fatty acids and two equivalents of soda, combined with variable quantities of water. The different analyses of soap which are on record can hardly be considered as satisfactory, for not only does the equivalent of the acid vary according to the fatty substance producing it, but the quantity of water is very variable. Thus a sample of yellow soap which had been left during nine days exposed to the air of a room with a stove, gave Dr. Thomson—

Oily acids . . .	76·9
Soda . . .	10·6
Water . . .	12·5
	100

Another specimen of the same kind of soap, made by a different manufacturer, exposed 31 days to the air in a room with a stove, yielded the same chemist—

Oily acids . . .	[illegible]
Soda . . .	[illegible]
Water . . .	[illegible]
	100·

The excess of water in the former is evidently owing to its having been dried for a shorter time; but Dr. Thomson considers both these specimens as composed of one equivalent of acid and two equivalents of soda, and consequently the acids must be differently constituted, for their saturating powers are as 14 to 17 very nearly.

Braconnot, Thenard, and Pelletier, respectively, analysed Marseilles soap (1), marbled soap (2), and common French soap (3); the following are the results:—

	(1)	(2)	(3)
Oily acids .	68·40	64·	60·94
Soda . .	10·24	6·	8·56
Water . .	21·36	30·	30·50
	100·	100·	100·

In vegetable fat oils, olive-oil for example, the glycerin is combined with margaric and oleic acids, forming margarate and oleate of glycerin, and consequently soap made with this oil is a margarate and oleate of soda, instead of a stearate and oleate of this base.

The soaps which have the alkalis for their bases are soluble in water, though the solution is in general milky; they are also soluble in alcohol, and the solution is used frequently as a test of what is called the *hardness* of water; on the addition of the solution to a water containing earthy salts, as indeed spring and river water almost always do, a white curdy deposit is formed; this is an earthy soap, formed, in the case of sulphate of lime, by double decomposition, the sulphuric acid combining with the alkali and the fatty acids with the lime, thus forming an earthy soap, which, being insoluble in water, is precipitated. Bi-carbonate of lime produces a corresponding effect, and as the quantity of this in river water is generally much larger than that of sulphate of lime, the principal effect produced is owing to it.

Acids also decompose soaps, and though the effect is apparently similar, yet it is in reality different; thus when sulphuric acid is added to soap, a white precipitate is formed, but this is merely the fatty acid which the soap contained, and shows the change which the fat employed has undergone; it is either stearic, oleic, or margaric acid, &c., or a mixture of two or more of them; sulphate of soda remains in solution when a soda soap has been thus decomposed.

It is well known that there are certain preparations used in medicine under the name of emulsions and liniments, which are obtained by merely agitating either ammonia, potash, soda, or lime-water with oil: the first of these is an ammoniacal soap, the second and third are imperfect alkaline soaps, and the fourth is an earthy soap, and barytes and strontia-water form compounds analogous to it; these earthy soaps, as has been already remarked, are insoluble in water, or nearly so. Metallic soaps are formed by heating certain metallic oxides, as those of lead, mercury, and bismuth, with fatty matter; glycerin is separated, as has already been mentioned, and the metallic soaps formed are insoluble in water; the only soap of this kind extensively employed is that of oxide of lead, which is largely used under the name of diachylon, or lead plaster.

Soap Trade.—The Soap Manufacture is one of considerable importance, which contributes a million sterling to the revenue, and creates an annual demand for above 60,000 tons of tallow, 12,000 tons of palm oil, and 20,000 tons of rough turpentine as the raw material. From the Excise returns we ascertain that the total quantity of soap made in Great Britain in 1840 was 77,123 tons; that 4516 tons were exported to Ireland in the same year; 9379 tons to foreign parts; and 8072 tons were used in the various branches of our textile manufactures. The domestic consumption of the population of Great Britain was 58,593 tons. The principal seats of the soap manufacture in England are Liverpool and Runcorn, London, Brentford, Bristol, and Hull. In 1840 nearly three-fourths of the total quantities of soap were made at these places:—

	Hard.	Soft.
Liverpool . .	46,103,782 lbs.	5,643,542 lbs.
Runcorn . .	12,339,986	
London . .	37,548,574	758,468
Brentford . .	5,071,543	
Bristol . .	7,813,721	287,097
Hull . .	4,825,125	696,120

There are manufactories of considerable extent at Bromsgrove, Newcastle, Gateshead, Warrington, and Plymouth. In Scotland two-thirds of the total quantity of soap are made at Glasgow and Leith. In 1835 it was estimated that about 1200 tons of soap were made at Belfast; 600 at Londonderry; about 700 at Limerick and in the neighbourhood; and about 300 tons at Cork. The consumption of Ireland in 1835 was between 10,000 and 11,000 tons, one-half of which was imported from England, the remainder being of domestic manufacture.

In 1711 an Excise duty of 1*d.* per lb. was first imposed on all soap made in Great Britain, which was raised in 1713 to 1½*d.* per lb. In 1782 the duty was again increased, and a distinction was for the first time made between hard and soft soap, the duty on the former being 2½*d.*, and on the latter 1¾*d.* per lb. In 1816 another increase of duty took place, and hard soap was subjected to a duty of 3*d.* per lb. Since May 31, 1833, the duty has been 1½*d.* per lb. on hard soap, and 1*d.* per lb. on soft. The soap duty has not yet been extended to Ireland. In 1785, when the quantity of soap made in Great Britain was under 40,000,000 lbs., the number of manufacturers was above 900; but in 1815 the number had diminished to 447; in 1830 to 309; and in 1839 to 196, of whom 177 were in England, and 19 in Scotland. In 1832 one-twentieth part of the soap duty was paid by a single house. The number of manufacturers in Ireland has decreased from 214 in 1835, to 183 in 1839. Every manufacturer of soap, both in Great Britain and Ireland, is required to take out an annual licence, which costs 4*l.*

The interference of the Excise in the manufacture of soap was, until recently, exceedingly arbitrary and vexatious; but in the 'Seventeenth Report of the Commissioners of Excise Inquiry' (Soap), dated Dec., 1835, the discontinuance of the system of survey which then existed was recommended. The Act which at present regulates the manufacture is the 3 and 4 Vic., c. 49, passed in August, 1840. It repealed seventeen other Acts, so far as they concerned the making of soap. The article may now be made in any way or of any material which the manufacturer thinks most judicious, as the Excise does not interfere with the process of manufacture.

The quantity of soap made in Great Britain at the under-mentioned periods was as follows:—

Year.	Hard.	Soft.
1791	43,123,578 lbs.	3,842,136 lbs.
1801	52,427,791	3,199,609
1811	70,596,590	5,509,677
1821	89,168,834	7,758,939
1831	109,080,944	9,641,007

The quantity made from 1832 to 1840 inclusive, has been as follows:—

Year.	Hard.	Soft.	Duty.
1831	109,080,944 lbs.	9,641,907 lbs.	£1,433,617
1832	119,503,092	10,350,703	1,569,262
1833	138,170,787	11,731,156	1,174,421
1834	144,344,043	10,401,281	945,489
1835	148,806,207	12,103,109	980,468
1836	146,539,210	13,358,894	971,523
1837	140,822,611	11,794,834	929,286
1838	158,573,948	13,549,998	1,047,545
1839	155,585,756	14,874,963	1,034,390
1840	159,220,068	13,535,856	1,079,448

The quantity made in England and Scotland in 1840, separately, was,—

	Hard.	Soft.
England .	148,803,574 lbs.	8,917,668 lbs.
Scotland .	10,416,494	4,618,188

The quantity used by manufacturers, on which an allowance is made, has varied so little during the last few years, that it will be sufficient to give the quantities used in each class of manufactures for 1840:—

Allowance to Manufacturers of	Hard.	Soft.	Allowance.
Woollens .	6,021,114 lbs.	6,611,178 lbs.	£42,519
Linens . .	6,798	1,325	47
Silk . .	1,578,483	1,286,531	14,374
Flax or Cotton	1,965,414	611,859	14,514
Total .	9,571,809	8,510,893	£71,955

In consequence of the increase of duty in 1816, the price of soap advanced to 82*l.* per ton in the two following years; but in 1821-2-3, owing to the low price of the raw materials, the price fell to 68*l.*; and from this period it gradually declined to 52*l.* in 1830. In 1834, after the reduction of the duty in the previous year, the price was 47*l.*; and at present it is 50*l.* per ton. The old duty of 3*d.* per lb. discouraged cleanliness, and led to disease and its attendant evils. The reduction to 1½*d.* has not only been successful as a financial measure, but has conferred the greatest benefit on the poorer classes, who now consume a better and therefore more economical soap than before. In 1834 the consumption of Great Britain was estimated at 6½ lbs. per head, and though it has not yet reached 7 lbs., the proportion of soap of better qualities now consumed has increased. As the Excise allowance of one-tenth in favour of the manufacturer ceased in May, 1833, it is necessary to add one-ninth to the quantity charged previous to that year, in order to institute a comparison between the quantities made before and after the reduction of duty. The illicit manufacture of soap is still carried on, but not to its former extent. The time has probably arrived when the duty might be reduced to 1*d.* per lb. on hard soap, and ½*d.* per lb. on soft, and at the same time these duties might be charged on soap consumed in Ireland. At present a drawback is allowed on all soap exported to Ireland, and fraudulent practices take place in both kingdoms in consequence of this arrangement, and of the article not being subject to duty in Ireland. The quantity of soap exported to Ireland from Great Britain in each of the years under-mentioned was,—

	Hard.	Soft.	Drawback.
1834	11,258,526 lbs.	33,604 lbs.	£76,595
1835	12,459,747	8,458	77,966
1836	11,086,072	86,326	69,647
1837	10,040,747	98,018	63,163
1838	10,240,399	195,328	64,816
1839	9,375,451	161,216	59,268
1840	9,930,108	187,244	64,457

In 1840 Ireland exported 708,126 lbs. of soap to England, on which duty was paid; but it is stated that a large quantity of Irish soap is annually smuggled into England.

A small quantity of foreign soap is imported: in 1840, the importation amounted to 729 cwts., of which 398 cwts. were re-exported.

The exportation of English soap to foreign parts has been increasing within the last few years. This may partly be attributed to the more liberal character of the present Excise regulations for the manufacture of soap, which do not render it necessary to conform to certain processes, but permit the manufacturer to make experiments and improvements, and thus enable him to unite cheapness and excellence. Formerly, though obtaining the raw material at a lower rate than the manufacturers of other countries, he was unable to compete with them in foreign markets. A few years ago an English manufacturer brought soap-makers to London from Marseille, where excellent soap is made; but it was found that these men could not pursue the processes to which they had been accustomed, in consequence of the Excise restrictions. The countries to which soap is exported are not distinguished in the public accounts separately from candles; but the gross quantities exported in each of the following years were as under:—

	Hard.	Soft.	Drawback.
1834	12,459,747 lbs.	8,458 lbs.	£77,966
1835	12,987,365	8,954	81,209
1836	13,548,895	8,239	84,716
1837	11,119,515	13,274	69,552
1838	16,175,681	7,713	101,130
1839	21,148,724	9,231	132,218
1840	22,004,075	7,008	140,745

SOAP, *Medical Uses of*. In pharmacy and medicine the term soap is applied to combinations not only of oily and fatty matters with the alkalis soda or potash, but also with the volatile alkali (ammonia), lime (an alkaline earth), and metallic oxides, especially oxide of lead; likewise to solutions of resins in liquid potash, such as guaiacin [GUAIACUM], called therefore *Sapo guaiacinus*. The combinations of oils with ammonia or lime, being very thin, are generally termed *liniments;* the common one of hartshorn with oil is an example of the former, while oil and lime-water constitute the common application to burns termed Carron oil, from its frequent employment in the great iron-works at that place. The combination of oil with oxide of lead is generally termed a *plaster*. Some combinations of a volatile or fixed oil with an acid are sometimes called soaps, such as that of oil of turpentine with hydrochloric acid (artificial camphor), or of almond oil with sulphuric acid (*Sapo acidus*): but these are scarcely entitled to be so regarded. Among continental pharmaceutists, many cerates and mixtures of metallic salts with common soap are termed *soaps*, but they are more correctly called plasters.

Of soaps properly so called there are two kinds, the *soluble* and the *insoluble*. To the first belong the soaps of soda, potash, and ammonia; to the latter, the combinations with lime and lead; but even the soaps of soda and potash are only perfectly soluble in *soft* water, for *hard* waters, especially those abounding in salts of lime, decompose the original union and form an insoluble soap.

Soaps are further divided into *hard*, when soda is employed in their formation, and into *soft*, when potash is used: each of these presents some varieties according to the nature of the ingredients associated with them in the manufacture. A soap is sometimes prepared in which both alkalis are used, but it belongs to the class of soft soaps.

Of hard soaps, the fine kinds are made with soda and the purer vegetable oils, and the inferior kinds with animal oils or the coarser vegetable oils or resins. White soda soap is prepared with caustic soda and olive oil (in Spain), or with almond oil (in France). In its purest state it is called *medicinal* soap; in a less pure state, it is called Alicant, Venice, or Spanish soap. The Castile or marbled soap has this appearance communicated to it by sulphate of iron and red oxide of iron being added and stirred through it when the soap is nearly made. These are impurities which render it less fit for medical use in many cases than the white soap. When properly prepared, white soap should neither make an oily mark on paper nor have a burning alkaline taste. It should be perfectly soluble in pure water and in alcohol. Its alcoholic solution is the ordinary chemical test of the purity or softness of water. When an alcoholic solution is evaporated, the residuum constitutes *transparent* soap.

White soda soap is the only one which should be used internally. It is chiefly employed to form pills, which are gently aperient and antacid; their power in this latter respect is greatly increased by the addition of exsiccated carbonate of soda: this combination is of great utility in the treatment of gouty and calculous disorders, when an alkali is indicated. In other cases it is used to prevent the pills becoming hard and insoluble. White soap furnishes a ready antidote to the strong mineral acids, in cases of poisoning by any of these.

Soft soap is directed by the London Pharmacopœia to be made with potash and olive oil, but this order is seldom complied with. The soft soap above mentioned, in which both soda and potash are used, is made with olive and other oils and tallow. It is employed only to form the compound sulphur ointment. Common soft soap is made with train or cod-fish oil and tallow; from its ordinary appearance, it is sometimes called *black* soap. If a slight excess of alkali exist, its detergent powers are thereby heightened. Soft soap is of great service in many cutaneous diseases, several of which, when in a mild form, may be cured by it alone. It may be rendered still more useful by the addition of sulphur or sulphuret of potash (liver of sulphur). In the treatment of scabies, porrigo (ring-worm), and such diseases, this application is far superior to the ointments and other greasy compounds commonly employed, which increase the filth or uncleanness by which the disease is aggravated. It is also much cheaper.

SOAP-BERRY. [SAPINDUS.]

SOAPSTONE. [STEATITE.]

SOAR, River. [LEICESTERSHIRE.]

SOBIESKI, JOHN, son of James Sobieski, a Polish noble, castellan of Cracow, and a distinguished warrior, was born in 1629, in the district of Olesko, in the present Gallicia, or Austrian Poland, near the sources of the Bug and the Bog, on the feudal estate of his ancestors. He was carefully brought up under the superintendence of his father; he completed his education at Paris; served for some time in the mousquetaires, or body-guards, of Louis XIV.; and travelled with his brother Mark in France, Italy, and Turkey. The young Sobieskis were staying at Constantinople when the news of a fearful insurrection of the Cossacks, who were joined by a multitude of Polish serfs, made them hasten home. They overran Polish Russia, and destroyed many people, especially priests and Jews. Out of hatred of Catholic intolerance, they obliged all the monks and nuns whom they could seize to marry each other under pain of death: the khan of the Tartars had also espoused their cause. The king of Poland, John Casimir, a weak prince, harassed by the proud independence of the magnates, opposed but a feeble resistance to the devastating torrent. At last the insurgents met with a check under the walls of Zamosc, and a peace was made with the Cossacks, but it was soon broken; and the Poles suffered many reverses, in one of which Mark Sobieski was killed by the hands of the Tartars. His brother John continued to serve in the army with distinction against the Cossacks and Tartars, as well as against the Swedes and Russians; for at that time Poland was assailed on every side, and nearly ceased to exist as a nation. In 1660 John Sobieski gained a victory over the Muscovite general Sheremetoff; and for several years after he continued to fight with success against both Muscovites and Tartars, in consequence of which he was raised to the dignities of grand marshal and grand hetman of Poland.

In 1667 Poland was invaded by 100,000 Cossacks and Tartars. Sobieski marched to meet them at the head of only 20,000 men. At first he kept on the defensive, in order to weary out the assailants; but seizing a favourable moment, he sallied out of his entrenchments, routed the enemy, and compelled them to sue for peace. Poland was thus again saved from destruction. In 1671 he routed the Turks, who were led by Sultan Mahomet IV.; and some time after he took from them the fortress of Kotzim, till then considered impregnable. On the death of king Michael Wisniowietski, in 1674, the diet assembled to name a successor. Several candidates appeared: Charles of Lorraine was countenanced by Austria, and Philip of Neuburg by Louis XIV. Sobieski himself proposed the Prince of Condé; but the palatine Stanislaus Jablonowski having stated in an eloquent speech his objections to those candidates, concluded by saying, 'Let a Pole reign over Poland,' and he proposed the conqueror of Kotzim, John Sobieski. The effect was electrical; all the Polish and Lithuanian nobles shouted 'Long live John III.,' and John was proclaimed king. The country was in a state of exhaustion: the regular army consisted of only a few thousand men, the treasury was empty, and the crown jewels were pledged to the Jews. Sobieski redeemed the jewels, raised several regiments at his own expense, and then marched to oppose the Turks, who were advancing with a large force. He was obliged to shut himself up within Lemberg, which was speedily invested; but taking advantage of a heavy fall of snow which a high wind blew in the face of the Turks, he issued from the town with a small but devoted band, and the cry of 'Christ for ever,' and completely routed the besiegers. A fresh Turkish army came, at the head of which was the brave pasha of Damascus, who had acquired in war the surname of 'Shaïtan,' or 'the Devil,' accompanied by a formidable artillery. Sobieski entrenched himself, with about 10,000 men, between two villages on the banks of the Dniester, and there sustained for twenty days the attacks of the enemy and a continued cannonade. At last, on the 14th October, 1676, the Polish king issued out of his entrenchments with his few remaining followers, whom he drew up in order of battle. The Turks, who numbered between two and three hundred thousand, were astounded, and they began to cry out that it could not be a mere man who risked such odds, that Sobieski must be a wizard, and that it was useless to contend with the wizard king. The 'Shaïtan' pasha was superior to such superstition; but he knew that the 'pospolite,' or *levy en masse*, of the kingdom, was at hand; and he offered Sobieski an honourable peace, which was accepted.

A few years of peace followed, at least external peace, for Poland was seldom if ever at peace within herself. The king's authority was set at nought by the nobles, who would not listen to reform or redress of grievances, and by their veto dissolved every diet in which the attempt was made. In his own family, Sobieski was teazed and tormented by his wife, a French woman by birth, an ambitious domineering woman, whom he had not the heart to restrain. But a new storm was gathering to draw out Sobieski's energies. This time the attack of the Turks was directed against Austria. The Turks were countenanced by Louis XIV., the 'most Christian king' of France, who wished to humble the house of Austria to the dust. A most formidable army, commanded by the grand-vizier Kara Mustapha, after sweeping over Hungary, in the month of July, 1683, invested Vienna, from which the emperor Leopold and his family had fled. Germany, Italy, all Europe, were in consternation. All eyes were turned towards Sobieski. The Polish king had no reason to love Austria, but, as a Christian prince, he determined to defend the Eastern bulwark of Christian Europe against the dreaded Ottomans. Having assembled at Cracow an army of 16,000 men, he marched to the banks of the Danube, and was met on the way by the duke of Lorraine and other German princes with their contingents, and at length found himself at the head of 70,000 men. Having crossed the Danube, he ascended the ridge of the Kalemberg, which overlooks the Austrian capital. On the morning of the 11th of September, the allied army, reaching the summit of the ridge, saw before them the wide-spread tents of the Ottoman host in the plain below. On the following day Sobieski's army descended the mountain to attack the vizier, and, after a hard struggle, drove the Turks into their entrenchments, which were fortified with great care, and appeared even to Sobieski too strong to be forced. It was five in the afternoon, and he had given up all idea of attack for that day, when he spied the vizier sitting at the entrance of his splendid tent, tranquilly sipping coffee, with his two sons beside him. This composure provoked Sobieski, and he gave orders for an immediate attack. The Polish hussars cleared the ditch and rode into the camp, the infantry followed, and, after a rude shock, the Ottomans were driven in a confused mass towards the tent of the vizier. Kara Mustapha attempted to make a stand, but in vain: at last he fled with the rest; and Sobieski remained master of the whole camp, artillery, baggage, and all. On the news of the deliverance of Vienna, all Europe resounded with acclamations. Sobieski pursued the Turks into Hungary, and he experienced a defeat at Parany, where he was exposed to great personal danger; but he defeated them again at Strigonia, and at last cleared the whole country of them.

Returning to his own kingdom, he found himself again involved in domestic troubles. Every attempt that he had made for the regeneration of Poland was thwarted by some of the turbulent nobles by means of the veto which the constitution gave to each. Sobieski was even called a tyrant and traitor because he fretted at his own impotence to do good to his country. At the close of the stormy diet of 1688, he addressed the assembly in a sad and almost prophetic tone: 'What will be one day the surprise of posterity to see that after being elevated to such a height of glory, we have suffered our country to fall into the gulf of ruin; to fall, alas! for ever. For myself, I may from time to time have gained her battles; but I am powerless to save her. I can do no more than leave the future of my beloved land, not to destiny, for I am a Christian, but to God, the High and Mighty. You know that I am no believer in auguries; I do not seek after oracles; I place no reliance on dreams. It is not from auguries, but from faith, that I learn that the decrees of Providence cannot fail of accomplishment. The power and justice of Him by whom the universe is governed regulate the destiny of states. Wherever during the lifetime of the prince crime is attempted with impunity, where altar is raised against altar, and strange gods followed under the very eye of the true one, there the vengeance of the Most High has already begun his work.'

Sobieski was an accomplished scholar, and very fond of learning: he acquired the Spanish language at an advanced age, amidst the cares of his kingdom.

In 1696 Sobieski was suddenly taken ill, and died, on Corpus Christi day, and with him Polish greatness may be said to have expired. He was the last of its really patriot kings.

(*Lettres du Roi de Pologne Jean Sobieski*, publiées par De Salvandy, Paris, 1826; *Histoire de Pologne*, by the same author.)

SOCCAGE (more correctly *socage*) in its original signification, according to Bracton, Littleton, and others, is service rendered by a tenant to his lord by the soc (soke) or ploughshare. The term was afterwards extended to all services rendered which were of an ignoble or non-military character, and were fixed in their nature and quality. The certainty of the services to be rendered distinguished socage tenure from tenure in chivalry, or by knight's service, on the one hand, and from tenure in pure villenage by arbitrary services, on the other; and therefore Littleton says, 'A man may hold of his lord by fealty [FEALTY] only; and such tenure is a tenure in socage; for every tenure which is not a tenure in chivalry is a tenure in socage.' By some modern writers 'socage' is derived from 'soke,' a term importing a district having a particular jurisdiction. But there is no ground for supposing either that all lands within a 'soke' were held by one species of tenure, or that socage tenure was limited to such districts.

Socage is said by old writers to be of three kinds: socage in frank tenure; socage in antient tenure; and socage in base tenure. (*Old Tenures*, 125, 126; *Old Natura Brevium*, title *Garde*.) The second and third kinds are now called respectively tenure in antient demesne and copyhold tenure. The first kind is called free and common socage, to distinguish it from the two others, though as the term socage has long ceased to be applied to the latter, socage and free and common socage now mean one and the same thing.

Land denominated in Domesday 'reveland' is supposed by Lord Coke to be land holden by socage tenure. It was probably so called as being land from which the Reeve (the collector of the king's or lord's dues within the district) received rent in money, or in produce, in commutation for agricultural services.

Every tenure which had the same incidents as socage, properly so called, as derived from service of the plough, appears to have fallen under the same denomination. We however find the word soke used at a very early period for rent; and it is possible that the term socage may be derived, not immediately from the ploughshare, but from this secondary or derivative sense of the term soke.

Besides fealty, which the tenant in socage, like every other tenant, is bound to do when required, the tenant in socage, or, as he was formerly called, the socager or sockman, is bound to give his attendance at his lord's court-baron, if the lord holds a court-baron either for a manor [MANOR] or for a seigniory in gross. This tenure is also still subject to a payment amounting to one year's additional rent upon the death of the tenant; which payment is sometimes called relief [RELIEF], from one of a similar nature due to the lord upon the death of a tenant by knight's service on the reverter of land to the lord.

Both forfeiture and escheat are incident to tenure in socage, as they were also to tenure by knight's service. [ESCHEAT.] In that species of socage tenure which is called gavelkind [GAVELKIND], and which exists in some parts of Kent, there is no forfeiture.

Wardship is also incident to this tenure. But this incident is not, as formerly in knight's service, a benefit given to the lord, but a burthen imposed on the infant's next friend of full age, who must however be a person not capable of inheriting the estate upon his young kinsman's death. So anxious was the law to avoid entrusting the person and the property of the infant to the custody of a party who might benefit by his death, that we find that in the thirteenth century even illegitimate relations might not be guardians in socage. (Bracton, 89, 'Wardship.')

By the mutual consent of lord and tenant, socage tenure might have been converted into tenure by knight's service, or tenure by knight's service into tenure in socage. It sometimes happened that the tenant held by knight's service of a lord who held in socage; and, more frequently, that a tenant held in socage of a lord who held by knight's service.

In particular districts some of the incidents of tenure by knight's service were by custom annexed to the tenure in socage. Thus in the diocese of Winchester the lord claimed the wardship and marriage of his socagers.

Before the abolition of feudal burthens by the Commonwealth, confirmed upon the Restoration by 12 Car. II., c. 24, tenants in socage were bound to pay 20s. upon every 20l. of annual value, as an aid for making the lord's son a knight, and the same for marrying the lord's eldest daughter.

This tenure was also subject to the payment of fines upon alienations.

By the above statute, the provisions of which were extended to Ireland by the Irish Act of 14 and 15 Car. II., c. 19, tenure by knight's service was abolished, and all lands, with the exception of ecclesiastical lands held in free alms [FRANKALMOIGNE], were directed to be held in free and common socage, which, with the limited exception in favour of lands held in frankalmoigne, is now the universal tenure of real property throughout England and Ireland, and those colonies which have been settled by the English.

It is true that a large portion of the soil of all those countries is held by leaseholders, and in England also by copyholders, but the freehold of the land held by leaseholders and copyholders is in their lords or lessors, who hold that freehold by socage tenure.

SOCIAL WAR, also called the Marsian or Italian War (Bellum Sociale, Marsicum or Italicum), lasted from 91 till 88 B.C., and was the most formidable war ever carried on in Italy during the dominion of the Romans. The object of Rome was to maintain her supremacy over Italy, and that of her enemies was to annihilate Rome, and to establish an Italian republic on new principles of representation. It arose from the desire of the Italians to be placed on a footing of equality with the Romans as to the Roman franchise. The Italians contributed largely to the maintenance of the republic, and a great portion of the Roman armies always consisted of them. The natural result of this consciousness of their own importance was a wish to have a share in the administration of the state which they upheld, and for which they were constantly shedding their blood. The relation of the Italians to the ruling Romans at this time had great similarity to the position in which the plebeians had formerly been with respect to the patricians. Attempts to bestow the franchise upon the Italians had been made by C. Gracchus and M. Fulvius, but their hopes had been disappointed by the Roman aristocracy, who strenuously opposed all measures of that kind. During the period preceding the outbreak of the Social War, several distinguished Italians had taken up their abode at Rome, and had exercised the Roman franchise, and the Romans had connived, and tacitly sanctioned their citizenship. But just at the time when the Italians began loudly to demand the franchise, the consuls L. Licinius Crassus and Q. Mucius Scaevola the pontifex (95 B.C.) carried the Lex Licinia Mucia, which enacted that all those who had illegally exercised the Roman franchise should quit Rome, and return to their former homes. (Ascon. Ped. *in Cornel.*, p. 67, ed. Orelli; Cic., *Pro Sext.*, 13; *De Off.*, iii. 11.) This act at such a time naturally created great exasperation among the Italians, though they still hoped that their claims might be granted in a peaceful way. Four years passed without anything being done, until in 91 B.C. the tribune Livius Drusus, in his Lex de Civitate Sociis danda, renewed the attempt of Gracchus and Fulvius; but he was assassinated before he had attained his object. (Appian, *Civil.*, i. 36; Liv., *Epit.*, lib. 71.) Immediately after this act of violence another law (Lex Varia) was carried by the tribune Q. Varius, which enacted that all those should be prosecuted who had either publicly or secretly supported the claims of the Italian allies. (Appian, *Civil.*, i. 37; comp. Ascon. Ped. *in Cornel.*, p. 73; Orelli, *Onomast. Tull.*, iii., p. 291), and in consequence of this law the principal friends of the Italians were compelled to go into exile. It was now evident that the Italians could never hope to obtain their end without resorting to force. There arose a general commotion among the several nations of Italy: the Picentians, Vestinians, Marsians, Pelignians, Marrucinians, Samnites, and Lucanians entered into a sort of confederacy among themselves; secret embassies were sent from place to place, and at last a meeting of deputies was held at Asculum in the country of the Picentians. The Latins, Etruscans, Umbrians, and Campanians did not join the insurgents. The Romans in the meanwhile also sent out their emissaries in various directions, with the intention of putting down the insurrection either by persuasion or by threats; but when the proconsul Servilius Caepio appeared at Asculum, and angrily exhorted the confederates to desist from their undertaking, he and his legate Fonteius were murdered by the enraged people in the theatre. All the Romans who were at the time at Asculum suffered the same fate, and their property was seized and destroyed. (Appian, *Civil.*, i. 38; Vell. Pat., ii. 15; Liv., *Epit.*, lib. 72.) After these occurrences an embassy was sent to Rome, to try whether the question might still be settled peaceably; and when this last attempt was fruitless, the Italians rose in arms. All their towns were protected by strong garrisons, independent of which their army, which was ready for fighting, amounted to nearly 100,000 men. The force which the Romans had to oppose to them was nearly equal, for they had drawn reinforcements from all quarters, and even enlisted their freedmen, which had never been done before. (Appian, *Civil.*, i. 49; Liv., *Epit.*, lib. 74.) The Italian allies were determined to raze Rome to the ground, and to form all Italy into one great confederate republic. Arrangements were made accordingly; Corfinium was made the capital of the new republic, and its name was changed into Italica. (Strabo, v. 4, p. 391, Tauchnitz; Vell. Pat., ii. 16.) The administration was entrusted to a senate, consisting of five hundred deputies, elected by the several towns of the confederacy, to two consuls, and twelve praetors. (Diodor., *Fragm.*, lib. 37, p. 245, ed. Tauchnitz.) The Marsians Silo Popaedius and C. Papius Mutilus were the first two consuls of the confederacy. Other distinguished generals among them were Herius Asinius, Insteius Cato, C. Pontidius, Marius Egnatius, Telesinus Pontius, and others. The war extended nearly over all Italy. The accounts which we have of it are so obscure, incoherent, and fragmentary, that it is impossible to trace all the operations in detail. The whole scene of the war may however be divided into three regions: the southern, comprehending the south of Italy as far as the river Liris; the middle, from the Liris to the frontiers of Picenum; and the northern, which was chiefly in Picenum. The Roman army in the south of Italy was under the command of L. Julius Cæsar and four legates; the forces of the confederates in this quarter were commanded by C. Papius Mutilus, who took many towns, and transferred the war into Campania, where the Samnites, commanded by Marius Egnatius, put L. Cæsar to flight, though some time afterwards he gained a victory near Acerrae. His colleague, the consul P. Rutilius Lupus, with five legates, commanded in central Italy, and was opposed to Silo Popaedius, a very distinguished general, whose uninterrupted success was only checked by the energy of the legates Marius and Sulla. Rutilius himself was slain in Apulia by Vettius Cato, and Q. Caepio, one of his legates, by Silo Popaedius. Marius was now entrusted with the command of the whole army of Rutilius. At the end of the first year the confederates had gained decided advantage over the Romans. The Etruscans and Umbrians also began to join the confederates, but they were soon reconciled to Rome. At this perilous juncture the Romans devised an admirable plan for strengthening themselves by the celebrated Lex Julia de Civitate, B.C. 90, which conferred the Roman franchise (Romana Civitas) upon all the Latins and Socii (Sociis et Latinis; Cic., *Pro Balb.*, 8), who had remained faithful to Rome. Upon these new citizens Rome could now place full dependence, and her armies were strengthened by them. Rome, with her central position, and surrounded by the faithful Latins, had thus great advantages over the Italians, who were obliged to leave strong garrisons in all their towns, and thus to split their forces into many fractions. The Latin colony Aesernia however was taken by the Samnites. The first signal victory which the Romans gained was in 89 B.C., under the consul Cn. Pompeius Strabo, who defeated 70,000 Italians at Asculum, which was destroyed. This victory was followed by several others, for L. Murena and Metellus Pius defeated the Marsians; Sulla, the Hirpinians and Samnites, who now transferred the seat of government from Corfinium to Aesernia, and henceforth, notwithstanding their defeat, became the soul of the war. Several of the confederates, disheartened by the success of the Roman arms, deserted the common cause, and concluded separate treaties with Rome, until at last the Samnites and Lucanians alone carried on the war. The undertakings of Mithridates in Asia, and the connections which the Italians began to form with him (Diodor., *Fragm.*, lib. 37, p. 247, Tauchnitz), as well as the hostility between Marius and Sulla, rendered the Roman senate now more than ever inclined to bring the destructive war to a close. In consequence of this the Roman franchise was promised to all who would lay down their arms. The offer was accepted by all, with the exception of the Samnites, who were resolved either to conquer or to perish, and who, in the civil war which soon ensued, joined the party of Marius. [SAMNITES, p. 380.]

Nearly all the nations of Italy now acquired, one after another, the franchise. Concerning the relation of these new citizens to the old ones, see ROME, p. 109. At the end of this war, then, Rome was, notwithstanding the reverses of the Italians, compelled to grant what at its commencement she had obstinately refused; but this refusal cost her and Italy the flower of their population, for nearly 300,000 lives were lost during these fatal two years (Vell. Pat., ii. 15), many towns were destroyed, and many districts laid waste, which were never restored to their former state of prosperity.

The history of the Social War is the subject of several separate works in modern times, among which there is one by Heyne, 'De Belli Romani Socialis Causis et Eventu, respectu ad Bellum cum Coloniis Americanis gestum habito,' in his 'Opuscula,' vol. iii., p. 144, &c.; C.G. Keferstein, 'De Bello Marsico,' Halae, 1812; C. A. F. Weiland, 'De Bello Marsico,' Berlin, 1834.

SOCIETIES, LITERARY AND SCIENTIFIC. A sketch of the origin and general history of associations for the cultivation of particular branches of science and literature will be found under the word ACADEMY, along with an enumeration of the most distinguished among such of these bodies or institutions as have adopted that name. As is there stated, what would be called academies on the Continent are more commonly called societies both in England and in the United States of America; and a few of them are also so designated in France and other Continental countries.

I. BRITISH SOCIETIES.

Of some of the principal of these, such as the Royal Societies of London and Edinburgh, detailed accounts are given under their names. Some of those established in provincial towns will also be found noticed in the articles on the towns. The following list however includes all the literary and scientific societies existing in the United Kingdom and its dependencies, that are of any eminence, whether elsewhere mentioned or not:—

Society for promoting the Discovery of the Interior parts of Africa, commonly called the African Association. [AFRICAN ASSOCIATION, vol. i., p. 188.]

Royal Agricultural Society of England; established 1838; incorporated 1840.

Agricultural Society of Ireland; established 1840.

Society of Improvers in the Knowledge of Agriculture in Scotland; (extinct) 'Select Transactions,' prepared for the press by Robert Maxwell, 8vo., Edinburgh, 1743.

Society of Antiquaries of London, commonly called the Antiquarian Society. [ANTIQUARIES, SOCIETY OF, vol. ii., p. 117.]

Society of Antiquaries of Scotland; established 1782, incorporated 1783; 'Transactions,' 4to., Edinburgh, 1792, &c.

Society of Antiquaries of Newcastle upon-Tyne; 'Archaeologia Aeliana,' 4to., Newcastle, 1816, &c.

Society of Apothecaries of London. [APOTHECARIES, COMPANY OF, vol. ii., p. 175.]

Architectural Society of London; established 1806; 'Essays,' 8vo., London, 1808, &c.

London Society for the Encouragement of Arts, Manufactures, and Commerce; established 1753; 'Transactions,' vol. i., 8vo., London, 1783. [SOCIETY FOR THE ENCOURAGEMENT OF ARTS, &c.]

Bahama Agricultural Society; 'Communications,' 4to., Nassau, 1802, &c.

Bath Society for the Encouragement of Agriculture, Arts, Manufactures, and Commerce; founded 1777; 'Letters and Papers,' 8vo., Bath, 1792, &c.

Society of Arts for Scotland.

Association for the Promotion of the Fine Arts in Scotland; established 1834.

Society of Artists of Great Britain; incorporated 1765 re-incorporated 1768, under the name of the Royal Academy of Arts. [ROYAL ACADEMY, vol. xx., p. 202.]

Asiatic Society of Bengal; founded at Calcutta, 1784. [ASIATIC SOCIETIES, vol. ii., p. 484.]

Royal Asiatic Society of Great Britain and Ireland; founded at London, and incorporated, 1824. [ASIATIC SOCIETIES, vol. ii., pp. 484, 485.]

Bombay Asiatic Society, originally Literary Society of Bombay. [ASIATIC SOCIETIES, vol. ii., p. 485.]

Madras Royal Asiatic Society, originally Literary Society of Madras. [ASIATIC SOCIETIES, vol. ii., p. 485.]

Royal Astronomical Society of London; founded 1820 'Memoirs,' 4to., London, 1822, &c.

Botanical Society of London.

British Association for the Promotion of Science; established 1831; 'Transactions' in 8vo. annually.

Cambridge Philosophical Society; established 1819; incorporated 1832; 'Transactions,' 4to., Cambridge, 1821, &c.

Camden Society for the Publication of Early Historical and Literary Remains; founded at London, 1838; first publication, 1839.

London Society for promoting Practical Design.

Society for the Diffusion of Useful Knowledge; established 1826; incorporated 1832; first publication, 1827.

Royal Dublin Society for Improving Husbandry and other Useful Arts; incorporated 1749 [DUBLIN, vol. ix., p. 172]; 'Weekly Observations,' 8vo., Dublin, 1739, &c.; 'Transactions,' 8vo., Dublin, 1799, &c.

Other Dublin Societies. [DUBLIN, vol. ix., p. 172.]

Central Society of Education; first publication, 12mo., London, 1837.

Smeatonian Society of Civil Engineers; incorporated 18[illegible] [SMEATON, p. 145.]

Entomological Society of London; established 18[illegible] 'Transactions,' 8vo., London, 1807, &c.

Royal Geographical Society of London; established 18[illegible] 'Journal,' 8vo., Lon., 1832, &c.

Geological Society of London; established 1807; 'Transactions,' 4to., London, 1811, &c.; Second Series, 1824.

Royal Geological Society of Cornwall; established 1814, 'Transactions,' 8vo., London, 1818, &c.

Harveian Society of London.

Highland Society of London; founded 1778; incorporated 1816.

Highland and Agricultural Society of Scotland; founded 1784; 'Prize Essays and Transactions,' 8vo., Edinburgh, 1799, &c.; New Series, 8vo., Edinburgh, 1829, &c.

Horticultural Society of London; founded 1804; 'Transactions,' 4to., London, 1807, &c.; Second Series, 4to., 18[illegible], &c.

Caledonian Horticultural Society; 'Memoirs,' 8vo., Edinburgh, 1814, &c.

Hunterian Society of London.

Royal Jennerian Society; founded 1803; 'Annual Reports,' 8vo., London, 1804, &c.

Linnean Society of London; founded 1788; incorporated 1802; 'Transactions,' 4to., London, 1791, &c.

Royal Society of Literature of the United Kingdom; incorporated 1823; 'Transactions,' 4to., London, 1827, &c.

Bath Royal Literary and Scientific Society.

Bristol Literary and Philosophical Society.

Hull Literary and Philosophical Society.

Leeds Literary and Philosophical Society.

Manchester Literary and Philosophical Society; founded 1781; 'Memoirs,' 8vo., 1789, &c.; Second Series, 8vo., 1805, &c. [See vol. xiv., p. 374.]

Edinburgh Society for Improving Medical Knowledge; founded 1731 (on the basis of the Edinburgh Philosophical Society, established in 1718); converted into Society for Improving Arts and Sciences, 1739 (now the Royal Society); 'Medical Essays and Observations,' 5 vols. 8vo., Edinburgh, 1733-44.

Westminster Medical Society.

Medico-Botanical Society of London; 'Transactions,' 8vo., London, 1829, &c.

Royal Medical and Chirurgical Society of London; established 1805; 'Medico-Chirurgical Transactions,' 8vo., London, 1809, &c.

Medico-Chirurgical Society of Edinburgh; 'Transactions,' 8vo., Edinburgh, 1824, &c.

Mineralogical Society of London; established 1799 (incorporated with Geological Society in 1811).

Motett Society for revival of the Ancient Choral Music of the Church; established 1841.

Royal Academy of Music.

Natural History Society of London.

Natural History Society of Manchester.

Natural History Society of Northumberland, Durham, and Newcastle-upon-Tyne; 'Transactions,' 4to., Newcastle, 1831, &c.

Natural History Society of Shropshire and North Wales.

Natural History Society of Warwickshire.

Literary and Philosophical Society of Newcastle-upon-Tyne; established 1793; 'Annual Reports,' 8vo., Newcastle, 1793, &c. [NEWCASTLE, vol. xvi., p. 157.]

Ornithological Society of London.

British Institution, established 1805, exhibits annually in Pall Mall.

Society of British Artists, exhibiting in Suffolk Street, Pall-Mall East; first exhibition, 1824.

Society of Painters in Water Colours, exhibiting in Pall-Mall East.

New Society of Painters in Water Colours, founded in or about 1830; exhibits annually.

Percy Society, for publishing old ballad poetry, &c.; established 1840; first publication, 1840.

Phrenological Society of Edinburgh; 'Transactions,' 8vo., Edinburgh, 1824, &c.

London Phrenological Society.

Society of Physicians in London (extinct); 'Medical Observations and Enquiries,' 6 vols. 8vo., London, 1757-84.

Royal Physical Society of Edinburgh; established 1771.

Royal Polytechnic Society of Cornwall; established 1833; 'Annual Reports,' 8vo., Falmouth, 1833, &c. [FALMOUTH, vol. x., p. 194.]

Geological and Polytechnic Society of the West Riding of Yorkshire; established 1838.

Royal Society of London. [ROYAL SOCIETY, vol. xx., p. 205.]

Royal Society of Edinburgh. [ROYAL SOCIETY, vol. xx., p. 211.]

Shakespeare Society, for publishing works relating to Shakespeare and the drama; established 1840; first publication 1841.

Statistical Society of London; established 1834; 'Journal,' 8vo., London, 1838, &c.

Statistical Societies of Birmingham, Bristol, Glasgow and Clydesdale, Leeds, Liverpool, Manchester, and Ulster; all established since 1832; have almost all published Transactions or Reports.

Surtees Society; first publication, 1835.

Wernerian Natural History Society; established 1808; 'Memoirs,' 8vo., Edinburgh, 1811, &c.

Yorkshire Philosophical Society.

Zoological Society of London; incorporated 1829; 'Transactions,' 4to., London, 1835, &c.

Cambridge Antiquarian Society; established 1839. Some 'Transactions' published.

Royal Institute of British Architects; established 1834; incorporated 1837; London.

Oxford Architectural Society; established 1839.

Ashmolean Society, Oxford.

Royal Botanic Society; incorporated by charter 1839.

Cambridge Camden Society; established 1839.

Institution of Civil Engineers; established 1818; incorporated 1828. 'Transactions,' 1st vol., 4to, 1836.

[illegible] Society of [illegible]; established 1840; first work published 1841.

[illegible] Society; established 1839.

Musical Antiquarian Society, for publishing scarce English Music; established 1840; first publication 1841.

Parker Society, for printing works of the early fathers of the Church; established 1841.

Spalding Club, Aberdeen; established 1839; for antiquarian objects.

Numismatic Society; established 1836.

Art Union of London; established 1836.

Art Union of Ireland.

Granger Society, for publishing portraits and memoirs of illustrious persons; established 1840; first publication 1841.

II. AMERICAN SOCIETIES.

American Philosophical Society, Philadelphia; founded 1769; 'Transactions,' 4to., Philadelphia, 1771, &c.; New Series, 4to., Philadelphia, 1818, &c. [PHILADELPHIA, vol. xvii., p. 71.]

American Historical Society, Philadelphia. [PHILADELPHIA, vol. xvii., p. 71.]

Massachusetts Historical Society, Boston; founded 1791; 'Collections,' 8vo., 179 , &c.

Historical Society of New York; founded 1804; 'Collections,' 8vo., 18 , &c.

New York Literary and Philosophical Society; founded 1815; 'Transactions,' 4to., 1815, &c.

Medical Society of New York.

Historical Society of Concord, New Hampshire.

Essex Historical Society, at Salem, Massachusetts.

American Antiquarian Society; 'Transactions,' 8vo., Worcester, 1820, &c.

III. CONTINENTAL SOCIETIES.

Société Royale de Médecine; established 1776, afterwards incorporated with the Institut National [see vol. xii., p. 407]; re-established 1820; 'Mémoires,' 4to., Paris, 1779, &c.

Société des Pharmaciens de Paris; (?) 'Journal, ou Recueil d'Observations de Chimie et de Pharmacie,' 4to., 1797, &c.

Société Royale d'Agriculture de Paris; (?) 'Mémoires d'Agriculture, d'Economie Rurale et Domestique,' 8vo., 1785, &c.

Société de Botanistes; 'Journal de Botanique,' 8vo., Paris, 1808, &c.

Société Philomathique de Paris; 'Bulletin des Sciences,' 4to., Paris, 1797; 8vo., 1799; 'Nouveau Bulletin,' 4to., Paris, 1807, &c.

Société d'Histoire Naturelle de Paris; (?) 'Actes,' folio, Paris, 1792, &c.

Société Royale des Antiquaires de France, formerly Académie Celtique; (?) 'Mémoires et Dissertations sur les Antiquités Nationales et Etrangères,' 8vo., Paris, 1817, &c.

Société de Géographie de Paris; 'Recueil de Voyages et de Mémoires,' 4to., Paris, 1824, &c.

Société d'Arcueil; 'Mémoires de Physique et de Chimie,' 8vo.

Société d'Encouragement pour l'Industrie Nationale, Paris; 'Bulletin,' 4to., 1802, &c.

Société des Sciences, d'Agriculture, et des Arts du Département du Bas Rhin; 'Journal,' 8vo., Strasburg, 1824, &c.; 'Nouveaux Mémoires,' 8vo., Strasburg, 1832, &c.

Société de Physique et d'Histoire Naturelle de Genève; 'Mémoires,' 4to., Gen., 1821, &c.

Literary Society of Brussels.

Dutch Society of Sciences (Hollandsche Maatschappij der Wetenschappen), at Haarlem; (?) 'Transactions' (Verhandelingen), in Dutch, 8vo., Haarlem, 1754; in German, 8vo., Altenburg, 1758, &c.

Batavian Society (Bataafsch Genootschap der Proefondervindelyke Wysbegeerte); 'Transactions,' 4to., Rotterdam, 1774, &c.; new series, 4to., Amsterdam, 1800, &c.; 'Physical Transactions' (Natuurkundige Verhandelingen), 8vo., Amst. and Haar. 1799, &c.; 'Transactions' (Wijsgeerige Verhandelingen), 8vo., Amst. 1811, &c.

Batavian Society of Language and Poetry (Bataafsche Maatschappij van Taal en Dichtkunde); 'Transactions' (Werken), 8vo., 1804, &c.

Societas Philologica Lipsiensis; 'Commentarii,' ed. curavit C. D. Beckius, 8vo., Lips., 1801, &c.; second series, 1814, &c.

Societas Artium et Doctrinarum Rheno-Trajectina; 'Nova Acta,' 8vo., Utrecht, 1821, &c.; and in Dutch, 'Nieuwe Verhandelingen,' 8vo., Utrecht, 1822, &c.

Literary Society of Flushing.

Hamburg Society (Hamburgische Gesellschaft); 'Transactions,' &c. ('Verhandlungen und Schriften, nebst der Geschichte'), 8vo., Hamb., 1792, &c.

Royal Botanical Society of Bavaria, at Ratisbon; 'Transactions' (Schriften), 8vo., Ratisbon, 1792, &c.; 'Memoirs' (Denkschriften), 4to., Ratis., 1815, &c.

Society of Natural History, and other Societies, at Berlin. [Vol. iv., p. 298.]

Societas Latina Jenensis; (?) 'Acta,' edita ab J. E. Walchio, 8vo., Jen., 1752, &c.

Mineralogical Society of Jena.

Natural History Society (Naturforschende Gesellschaft) of Danzig; 'New Memoirs,' 4to., Danzig and Halle, 1820, &c.

Bohemian Society of Mathematics and National and Natural History (Privat-Gesellschaft in Böhmen zur Aufnahme der Mathematik, der Vaterländischen Geschichte, und der Natur-Geschichte); 'Transactions,' 8vo., Prague, 1775, &c.; New Series (' Neuere Abhandlungen der K. Böhmischen Gesellschaft der Wissenschaften'), 4to., Vienna and Prague, 1791, &c.

Royal Society of Sciences of Göttingen; founded in 1751; publishes the 'Göttingische Gelehrte Anzeigen,' which first appeared in 1739, before the foundation of the Royal Society, and under the title of 'Göttingische Zeitungen.'

Suabian National Society of Physical Philosophy and Natural History (Vaterländische Gesellschaft der Physiker und Naturforscher Swabens); 'Memoirs,' 8vo., Tübingen, 1805, &c.

Copenhagen Society of Literature and Science, Domestic and Foreign (Kiöbenhavnske Selskab af Laerdoms og Videnskabers, &c.); 'Memoirs,' 4to., Copen., 1747, &c.

Royal Danish Scientific Society; 'Memoirs,' 4to., 1781, &c.; New Series, 4to., 1801, &c.

Icelandic Royal Society of Copenhagen; and other Icelandic Societies. [See vol. xii., p. 126.]

Upsal Royal Society of Sciences; founded in 1720; 'Transactions,' 4to., 17.., &c.

Gothenburg Royal Society of Sciences and Belles Lettres.

Société des Naturalistes de l'Université Imperiale de Moscow; 'Mémoires,' 4to., Moscow, 1806, &c.

The few American societies must be considered as set down according to a loose notion of their respective eminence or importance; and the Continental societies are grouped as French, Belgic, Dutch, Hamburg, German, Danish, Icelandic, Swedish, Russian; following what seemed the most natural connection of the several countries.

SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE. In the month of November, 1826, Mr. Brougham convened a meeting of gentlemen, who formed themselves into a committee for promoting the composition, publication, and distribution of elementary works upon all branches of useful knowledge. The two main objects in view were to give the people books which might convey knowledge to uneducated persons, or persons imperfectly educated, and to reduce the price of scientific and other useful works to the community generally. The committee then founded a society, under the name of The Society for the Diffusion of Useful Knowledge, composed of donors of 10*l.* and annual subscribers of 1*l.* The average income arising from annual and life subscription in each of the first five years was 300*l.*, from which one-half is to be deducted for works given to subscribers. From that time the subscriptions gradually diminished; indeed the pecuniary support of the Society was after the first year derived almost entirely from the sale of its works.

In the year 1832 the Society was incorporated by a charter, which vested in the London committee the whole of its property, and gave them the control over its proceedings. The London committee consists of a chairman, of a vice-chairman and a treasurer elected annually, and sixty members, who hold their seats until forfeited by neglect of the duties prescribed by the by-laws of the Society.

From its outset the Society excluded from its works all subjects that involved differences of religious opinion, partly because the different religious bodies had occupied that field far more efficiently than the Society could hope to do; partly because the Society was supported by men of various religious opinions, and intended to address itself to the whole people without distinction of sect. Excepting in so far as the history of the Church may trench upon matters that belong to controversial theology, this rule of the Society has been strictly observed. Upon two occasions the rule excluding theological matter has caused works which had been intended to be undertaken by the Society to be prepared and published by individuals connected with it in their separate and private capacity, namely, the 'Illustrated Edition of Paley,' by Lord Brougham and Sir C. Bell, and Mr. Charles Knight's 'Pictorial Bible.'

The usual method adopted by the Society for the preparation of its works has been to engage the assistance of authors; these in the first instance submit a plan for the approval of the committee, by whom the manuscript and proofs of the works are usually revised. The committee has also in several instances engaged the service of an editor, who conducts the works entrusted to him, under the superintendence and control of the committee. The proofs are often likewise referred by the committee for revision to gentlemen not members of their own body; and these referees are sometimes, according to circumstances, remunerated for their assistance. By means of the local committees, a list of which is printed periodically on the wrapper of the Society's publications, and with the assistance of friends to the diffusion of useful knowledge in many parts of Great Britain and Ireland, various works that have been published by the Society, and particularly articles in their periodical publications, have had the advantage of the revision of persons who, from possessing local knowledge, or from other circumstances, have been enabled to make valuable corrections and additions. The copyright of the works published under the Society's superintendence is usually assigned to the Society, unless when the work has been projected by one of its publishers, and produced and conducted with his capital. Such has been the case with many of these published by Mr. Charles Knight.

The revenue which the Society derives from its works is usually a rent paid by the publisher for the use of the copyright, proportionate to the cost and price of the work, and the number of the edition.

The Society has published or superintended the publication of the following works:—1, 'The Library of Useful Knowledge,' consisting of a series of treatises on various branches of knowledge, as pure mathematics, physics, history, biography, and geography. These treatises comprehend nearly the whole of the sciences taught, reaching to their most abstruse parts; but treatises on each branch of physics have been also published, adapted to the conveyance of instruction in the most elementary and popular form. There are for example treatises teaching as much of natural philosophy as can be conveyed without a knowledge of mathematical science. Three hundred and sixty numbers of this series have been published. 2, 'The Farmer's Series,' consisting of works on the horse, on various kinds of cattle, on planting, on farms, on farm implements, and other agricultural subjects. 3, 'The Library of Entertaining Knowledge,' which consists of volumes, largely illustrated, relating to history and biography, arts and antiquities, descriptive geography, and natural history, treated in a popular manner. 4, 'The Journal of Education,' 10 vols. 5, 'The Penny Magazine,' 9 vols. 6, 'The Penny Cyclopædia,' 21 vols. (not yet finished). 7, A series of Maps, almost complete, and consisting of nearly 200 maps and plans of great cities: these maps are founded on the best and most recent authorities, and are prepared under the superintendence of the Society. 8, Maps of the Heavens. 9, 'The Gallery of Portraits,' containing engraved likenesses of eminent men, from original portraits or other good authority, with memoirs, in 7 vols. 10, Almanacs and Companions to them, from 1828 to 1842, both inclusive. 11, 'The Working Man's Companion.' 12, 'The Library for the Young.' 13, 'The Statistics of Great Britain.' 14, 'A Treatise on Friendly Societies;' 'A Treatise on Annuities;' 'A Manual for Mechanics' Institutions, and a Report of the Condition and Prospects of these Institutions. 15, A Series of Treatises on Governments. 16, 'Tables of Logarithms,' and Barlow's 'Tables of Squares, Cubes, &c.' The total number of volumes of various sizes hitherto (Nov., 1841) issued by the Society is 168.

From the profit of some of these works the Society has derived a considerable income, which it has devoted to the preparation of others, tending either to the advancement of science or to the moral or physical improvement of the people. Thus the work on the Statistics of the British Empire, and afterwards a set of large astronomical maps, were prepared with the Society's funds without hope of profit. Again, in the year 1829 the Society collected from all the Friendly Societies in England returns of the amount of sickness and mortality experienced by them during the preceding five years; and from these returns and other data a work was written by Mr. Ansell. More recently it has made similar inquiries concerning the state of Mechanics' Institutions, and has published the result of the inquiries, with suggestions for the improvement of those useful bodies, which it has united into associations in various parts of the kingdom, for mutual advice and assistance. The Society is prohibited by its charter from dividing any profit among its members, or in any way deriving gain from its publications: all that it does and can do is to make the profit on one work pay for the loss on another.

An impartial estimate of the direct and indirect effects of the Society's labours can scarcely be expected in this place, nor shall we attempt more than the statement of a few facts. Until the publication of 'The Library of Useful Knowledge,' persons of small means were unable to procure any scientific works, except at a high price and in a cumbrous form; nor were there any separate elementary treatises on particular branches of science that could be had for a few pence. Thus in all the memoirs of men who have raised themselves by their own exertions from humble circumstances to literary or scientific fame, we find that the greatest difficulty which they have had to encounter has been the obtaining of books. Of many of the scientific treatises in 'The Library of Useful Knowledge,' more than 25,000 copies have been sold, and the demand for them continues. Of 'The Penny Magazine,' the sale at one time reached nearly 200,000 copies; and if the sale has diminished, it is because other publications of the same kind afford to purchasers an opportunity of selection. The extent of the sale may be conceived when it is stated that for one woodcut as much as fifty guineas have been paid, to replace which (independently of the authorship and the cost of paper and printing, and other illustrations of that number) nearly 75,000 copies must have been sold. Until the publication of the Society's series, maps were luxuries confined to the rich; now nearly 25,000 copies of many of its maps have been sold; and other maps of the same form, and nearly as cheap as the Society's, have been published with success. But besides the direct benefit conferred on the public by placing in their hands works carefully prepared, vast advantage has been derived from the example of the Society's success. No sooner had 'The Penny Magazine' become successful, than the Christian Knowledge Society devoted a part of its large funds to the publication of 'The Saturday Magazine,' a meritorious work, similar in design to 'The Penny Magazine;' and soon afterwards the same body superintended the preparation of a series of popular works on subjects of general literature and science. The publication of the Society's 'British Almanac' was followed by an immediate improvement in those issued by the Stationers' Company, the suppression of two of the most absurd, and the publication of an excellent almanac by that corporation. 'The Library of Useful Knowledge' was followed (almost immediately) by Lardner's 'Cabinet Cyclopædia,' a work different in its form, but identical in its plan; and 'The Family Library,' published by Mr. Murray, was issued very soon after the first parts of 'The Library of Entertaining Knowledge' had appeared.

The sale of many of the Society's works has demonstrated that it is in most instances more profitable to count on a large number of purchasers for a good work, and accordingly to fix a low price, than to publish books in a costly form for the few.

Translations of many of the Society's works, especially of 'The Library of Useful Knowledge,' have been made into French, Spanish, and German. 'The Preliminary Discourse' has been also translated into Dutch, Swedish, and Portuguese. Societies after the model of that which we are describing, and with much the same name, have been founded at Paris, Madrid, Lisbon, Stockholm, Bombay, and at Canton, most of these being in correspondence with the London Society.

The effect of the Society's labours is demonstrated by the extensive adoption of the general principles on which they started, which is now apparent in the proceedings of the publishers generally. In one particular indeed it would be ruinous for the latter to imitate the former, namely, in expending their profits upon useful but unsaleable works; though it must be acknowledged that publishers frequently do, from want of foresight, that which the Society does from principle. In either case the benefit to the public is the same: works which produce useful effects by means of the few who require them, are attainable through the miscalculation of the publisher, as well as through the intentional expenditure of the Society. With regard to the latter, however, it must be stated that their name, and the mode of their publication, has frequently extended the circulation of their works beyond that which the same species of books could have been expected to have had; proving that many have been induced, by the efforts of the Society, to attempt the acquisition of information which they would otherwise never have hoped for. A mathematical work, of the sort which usually circulates its hundreds, has been increased to thousands by the Society. In fact, without claiming any peculiar merit for the material of the Society's publications, the following may be insisted on without any degree of partiality, and the work in which these observations appear may be cited as an instance: namely, that its efforts have had a remarkable success in bringing before a large number an amount of accurate knowledge which was formerly the property of a few only. The industrious student, if he required books of a high character of instruction, was obliged to content himself with those of a past age, which had gradually descended within his means as to price. If he can now commence his labours with the advantage of more modern assistance, he has to thank in a great measure those who discovered for him that books of the more learned character might be successfully published on the principles of cheapness which had been so often applied in other branches of trade. The number of editions of the best writers on all subjects which have appeared at almost artisans' prices within the last six years, and the amount of books now attainable by persons with very small means, may without arrogance be attributed to the example of the Society.

SOCIETY FOR THE ENCOURAGEMENT OF ARTS, MANUFACTURES, AND COMMERCE. The object of this Society, as expressed in their address or advertisement to the public, is 'to promote the arts, manufactures, and commerce of this kingdom, by giving honorary or pecuniary rewards, as may be best adapted to the case, for the communication to the Society, and through the Society to the public, of all such useful inventions, discoveries, and improvements as tend to that purpose.' It was projected in the year 1753; but the first public meeting took place in March, 1754. The plan, which has been styled by Anderson (*Hist. of Commerce*, vol. iii., p. 298), 'one of the noblest designs for the improvement of the general commerce of Great Britain which could possibly have been devised,' was formed by Mr. William Shipley, a drawing-master, whose public spirit appears to have been very superior to his station in life, and who acted for some time as secretary to the Society; and it was carried into effect by a few noblemen and gentlemen, among whom appear the names of Lord Folkstone, Lord Romney, and Dr. Stephen Hales. The services of Mr. Shipley were acknowledged by the Society voting to him, in 1758, a gold medal, 'for his public spirit, which gave rise to the Society;' and subsequently by the publication of his portrait as a frontispiece to the fourth volume of their 'Transactions.' The Society began, immediately after its formation, to advertise premiums for the encouragement of young persons of both sexes in the various departments of the fine arts; for improvements in agriculture and manufactures; for mechanical inventions; and for promoting the cultivation of valuable plants in British colonies. The utility of the scheme soon attracted a large body of supporters; and for many years the Society received constant additions to its members, and continued to dispense its rewards with increasing zeal and success. It has latterly fallen off in prosperity; a circumstance which may be partially accounted for in various ways, and is probably in great part attributable to the fact that its proceedings have not been made public so fully as the altered state of society has rendered desirable. While numberless other societies, different indeed in their aim, yet all having for their object the cultivation and diffusion of useful knowledge, have been brought into active operation, and while a new and popular scientific literature has been extensively introduced, the operations of the Society of Arts in collecting and diffusing information have remained almost stationary; and the result has been that the Society and its proceedings have fallen into a state of comparative obscurity, which is neither in character with its various and important objects, nor justified by the manner in which those objects have been pursued. Measures have been recently taken, and are now in agitation, for so far modifying the constitution of the Society and extending its operations, as to place it once more in the prominent station which it deserves to occupy; but of the proposed changes it would be premature to attempt to give any details.

For several years after the formation of the Society of

Arts, there was no authorized or official publication of the papers communicated to its various committees, or for making known the results of its labours. The publication of such information in an annual volume of 'Transactions' was contemplated soon after the commencement of the Society's operations; but the first volume did not appear until the year 1783. Many of the papers however which would otherwise have appeared in such a work, were published, with the sanction of the Society, in Dossie's 'Memoirs of Agriculture and other Œconomical Arts,' of which the first volume appeared in 1768, and the third and last in 1782. Some further particulars respecting the early proceedings of the Society are supplied by a 'Register of the Premiums and Bounties* given by the Society instituted in London for the Encouragement of Arts, Manufactures, and Commerce, from the original institution in the year 1754, to the year 1776 inclusive.' This register, which was prepared by a committee of the Society, and is arranged in a tabular form, was printed in folio, in 1778. From it, and from a brief history of the transactions of the Society, published in the first volume of Dossie's 'Memoirs,' the following summary of their early proceedings is taken. It is much to be regretted that there are no published statements from which the account can be readily continued to the present time.

In the department of *Agriculture* the pecuniary rewards given from 1754 to 1776 amounted to 3201*l.* 19*s.*; while during the same time 56 gold and 26 silver medals were distributed. In this class of rewards several were given to encourage the planting, raising, and preserving of timber-trees; especially of oak for ship-building. Some were given for the cultivation of madder, the supply of which had been previously dependent upon Holland. In addition to the premiums bestowed, the Society aided this undertaking by procuring an act of parliament to substitute, for a term of years, a fixed payment of 5*s.* per acre, instead of the payment of tithe in kind, which would have impeded the cultivation of so valuable a crop in England. The cultivation of hemp, of foreign grasses, and of several kinds of roots for the food of cattle, was also encouraged by prizes. Another object attempted, but not so successfully, was the production of bees'-wax in England in sufficient quantity to render this country independent of others for the supply of so useful an article. Several important agricultural implements were also brought into use, and experiments on drill husbandry were promoted and brought into public notice.

In the class of *Chemistry* the Society expended, in the same time, the sum of 1315*l.* 5*s.* in pecuniary rewards, besides giving 2 gold medals and 1 of silver. One of the most important objects attained in this department was the manufacture of crucibles, similar to the Hessian, of melting-pots suitable for smelting tin-ores, and of earthern retorts. The production of such vessels was commenced at Chelsea under the auspices of the Society: the supply had been previously obtained from the Continent. The discovery of a mine of cobalt in England, and the home manufacture of zaffre and smalt, were also encouraged. The manufacture of verdigris was established in this country; and the industry of the nation was further promoted by the introduction or improvement of the processes of tinning copper and brass vessels; dyeing woollen cloth, linen, cotton, silk, and leather; making buff leather; tanning with oak sawdust; making transparent varnish, white enamel, sal ammoniac, &c.

Under the head *Colonies and Trade*, the register shows an expenditure of 2785*l.* 13*s.* 8*d.* in pecuniary rewards, in addition to which 12 gold medals had been presented. The chief object of this part of the Society's operations is the introduction into British colonies of plants or manufactures previously confined to foreign countries; and in the period embraced by the document referred to, this object had been attained as far as regarded the production of potash and pearlash in North America, while much had also been done towards the raising of silk, the cultivation of the vine, and the manufacture of wine, indigo, vegetable oils, &c. The American war of independence put an end to many promising experiments in this department.

In the promotion of home *Manufactures*, besides those already alluded to under the head of chemistry, much was done in the early part of the Society's career; the sum expended in pecuniary rewards in this department being 2026*l.* 1*s.*, together with 1 gold and 8 silver medals. The manufacture of Turkey carpets, tapestry weaving, weaving imitations of Marseilles and India quilting, various improvements in spinning, lace-making, &c., were among the objects promoted. The improvement of paper, the making of chip and straw hats, of artificial flowers, and of catgut strings for musical-instruments were also encouraged.

In the *Mechanical* department 6 gold and 10 silver medals were given, and 2284*l.* 14*s.* 6*d.* was distributed in pecuniary rewards. The introduction of saw-mills into this country was one of the most important objects effected by the Society, while they also encouraged the use of many new or improved machines. The gun-harpoon for the whale-fishery was rewarded by them.

In the *Polite Arts*, embracing sculpture, painting, drawing, mapping, engraving, &c., the expenditure in money amounted to 8325*l.* 5*s.*; and the honorary rewards bestowed were as follows;—10 gold medals, 6 silver medals, 17 gold pallets, 47 great silver pallets, and 37 small silver pallets. The rewards offered by the Society not only had a great effect in encouraging individuals, but also promoted the establishment of the Royal Academy. The first public exhibition of paintings in the metropolis, which soon gave rise to others, was held in the rooms of the Society of Arts, in 1767; the apartments being gratuitously opened for the purpose in that and the two following years.

In addition to the matters embraced in the above classes, 3613*l.* in money and 16 gold medals were devoted to miscellaneous objects embraced by the comprehensive plan of the Society. The principal part of this expenditure, the sum of 3500*l.*, was applied to the promotion of a plan for supplying the metropolis with fish by land-carriage: a scheme which was also assisted by parliament to the amount of 2000*l.*

The total amount of pecuniary rewards bestowed by the Society down to 1776 was, according to the 'Register' above referred to, 23,551*l.* 18*s.* 2*d.*; or, including the cost of medals and pallets, 24,616*l.* 4*s.* 8*d.* This register was continued by manuscript additions to the end of 1813; and from the unpublished part, with a sight of which the secretary has favoured the writer, it appears that the pecuniary rewards bestowed from 1777 to 1813 amounted to about 2757*l.* 10*s.*, and that the medals and pallets distributed were 188 in gold and 464 in silver. Later than this there does not appear to be any condensed statement of the operations of the Society; but it has been stated for some years past, in their advertisement to the public, that upwards of 100,000*l.*, derived from voluntary subscriptions and legacies, has been expended in pursuance of their plan. It is needless to recapitulate the more recent proceedings of the Society, which have been the same in character, although more limited in extent, than those above mentioned; but it may be briefly remarked, in the words of the secretary's address at the distribution of prizes in 1841, that 'at a time when it stood alone in offering encouragement to the fine arts, it effected much good in that department; and that it can now point with proud satisfaction to the names of Bacon, Nollekens, and Flaxman, Cosway and Lawrence, Sharp and Sherwin, Pingo, Marchant, and Wyon, with many other eminent artists, the early manifestations of whose genius were noticed by the Society in a manner which, there can be no doubt, assisted very materially in its development.' Still more important perhaps have been the effects of the Society's encouragement of poor operatives, in improving the processes with which they are practically acquainted. The history of those inventions connected with weaving, which have been the objects of their encouragement within the last forty years, was adverted to in the address just quoted, as an illustration of what the Society have effected; about twenty pecuniary rewards having been given, chiefly to Bethnal Green and Spitalfields weavers, for inventions of great utility.

As before stated, the first volume of the Society's 'Transactions' was published in 1783. For forty-seven years from that time a volume appeared annually; but since 1829 the volumes have been biennial. An index to the first twenty-five volumes was published in 1808, and two others, embracing respectively from the twenty-sixth to the fortieth, and from the forty-first to the fiftieth, have since appeared. In 1774 the Society removed from their original premises opposite Beaufort-buildings, Strand, to their present house in the Adelphi, which was erected purposely for them; and in the years 1777-83 Barry decorated their great room with a series of pictures. [BARRY, vol. iii., p. 511.]

---

* *Premiums* are the rewards bestowed for matters respecting which the Society has made a specific offer; and *Bounties*, those which are given without any previous offer.

The Society of Arts consists at present of about eight hundred persons, of whom many are life members. Members are admitted by ballot, and subscribe two guineas or upwards annually, or twenty guineas or upwards in a single sum. The business is conducted by several committees, one being appointed for each department of its operations: and general meetings are held four times in each session, on the first Wednesdays of December, February, April, and June. Besides these, ordinary meetings are held every Wednesday evening, to receive reports from the several committees, &c. The Society issue gratuitously, every second year, a pamphlet containing a list of the premiums offered in the various classes of agriculture, fine arts, chemistry and mineralogy, colonies and trade, manufactures, and mechanics; and in which the privileges of the members are stated at length. The paintings in the great room, and the museum, which contains models of the machines rewarded by the Society, with specimens of the manufactures they have encouraged, may be seen gratuitously between the hours of ten and two on any week day, except Wednesday. According to the rules, admission must be obtained by an order from a member; but any respectable person can obtain admission even without this form. It is to be hoped that the utility of the collection may be soon extended by the suspension, in some cases, of a rule of the Society, which stipulates that all machines or processes rewarded by them shall be freely given up to the public, and not protected by patent,—a rule which now excludes many useful inventions from the benefits offered by its rewards and the publicity of its museum.

SOCIETY ISLANDS, the name given by Captain Cook, in honour of the Royal Society of London, to a cluster of islands in the South Pacific Ocean. They lie about 70 miles to the westward of another cluster, of which Tahiti (Otaheite) is the chief, named the Georgian Islands, in honour of George III. Mariners usually called the latter the Windward and the former the Leeward Islands. Recent geographers have been disposed to comprehend both the clusters under the name of Society Islands. As however the two clusters are politically as well as geographically distinct, it will be sometimes expedient to preserve the distinctive designations in speaking of them; although we are to be understood as noticing both groups under the general head. The following are the names and positions of these islands. The names are given according to the orthography introduced by the first missionaries, and used by the press now established among the people:

	S. lat.	W. long.
Meatia	17° 53′ 0″	148° 9′ 45″
Tahiti (Otaheite), north point	17° 29′ 17″	149° 33′ 15″
Eimeo	17° 30′ 0″	150° 0′ 0″
Maiaoiti, or Charles Sander's Island	17° 28′ 0″	150° 40′ 0″
Tetuaroa		
Huahine	16° 43′ 0″	151° 6′ 45″
Raiatea	16° 46′ 0″	151° 38′ 45″
Tahaa, three miles north of Raiatea.		
Borabora	16° 27′ 0″	151° 52′ 45″
Mauarua	16° 10′ 0″	152° 30′ 0″
Tubai		
Lord Howe's Island	16° 46′ 0″	154° 12′ 45″
Scilly Island	16° 28′ 0″	155° 24′ 45″

The five first are those called the Georgian Islands, and the rest the Society Islands, when the two groups are distinguished. The list is exclusive of several islets which surround or are interspersed among these.

Of all these islands, Tahiti is by much the largest and the most elevated. [Otaheite.] All the islands are mountainous in the interior, and have a border, from one to four miles wide, of rich level land, extending from the base of the high land to the sea; and although the outline of each has some peculiarity distinguishing it from the rest, in their general appearance they resemble each other. Tetuaroa, Tubai, Lord Howe's and the Scilly islands however form exceptions, as they are low coral islands, seldom rising many feet above the sea. Tahiti is 108 miles in circumference; Eimeo is supposed to be about 26 miles; Huahine probably more than 30; and Raiatea is somewhat larger. The others are of smaller extent. A corresponding resemblance prevails in the geological structure of the principal clusters and surrounding islands; the component substances being the same in all, although each has some distinguishing peculiarity of its own. A full account of these geological characteristics, analogous and distinctive, may be found in Ellis's 'Polynesian Researches.' There seems no reason to suppose that any of these islands are of altogether volcanic origin, like the Sandwich Islands. The entire mass of the latter has evidently been in a state of fusion, and offers no trace of any primitive or secondary rock. But in the Society Islands there are basalts, whinstone dykes, and homogeneous earthy-lava, retaining all the convolutions which cooling lava is known to assume; there are also kinds of hornstone, limestone, silex, breccia, and other substances, which under the action of fire do not appear to have altered their original form. Some are found in detached fragments, others in large masses. Although many unequal appearances of the action of fire occur in almost every island, yet Mr. Ellis states that he never met with any cavern, aperture, or other formation resembling a crater, nor had he ever heard of any, with the exception of the large lake, called by the natives Vaihiria, situated among the mountains of Tahiti. 'The wild and broken manner however in which the rocks and mountains now appear, warrants the inference that since their formation, they have been thrown up by some volcanic explosion, the disruptions of an earthquake, or some other violent convulsion of the earth; and have from this circumstance assumed their bold, irregular, and romantic forms.' All the Society Islands, and many others in the Pacific, are surrounded by a belt of coral rock, from two or three to twenty yards in width, and situated at distances from a few yards to perhaps two miles from the shore. Against this barrier the long rolling waves of the wide Pacific are driven with terrific violence by the trade-winds, and, arrested by it, often rise ten, twelve, or fourteen feet above its surface. These reefs protect the low lands from the violence of the sea; for while, beyond them, the surface of the water is agitated by the slightest breeze, all within is smooth water. There is usually a break or opening in these marine barriers, which offers an easy passage for shipping. The soil is various. The sides of the mountains are frequently covered with a thin layer of light earth; but the summits of many of the inferior hills present a thick stratum of stiff red ochre or yellow marl. This is seldom found on the lofty mountains composed of basalt or cellular volcanic stone, but generally covers the lower hills that rise between the interior mountains and the shore. The natives use it as a pigment for staining or painting their doors, window-shutters, canoes, &c., and, when mixed with lime, the walls of their houses. The level tracts along the coast are the most valuable parts of the land. The soil of those tracts is a rich alluvial deposit, with a considerable mixture of vegetable mould, and is exceedingly prolific.

The climate, products, character, and condition of the inhabitants are the same as those of Tahiti, the principal island. [Otaheite.]

Rain is much more frequent in the Society than in the Sandwich Islands, during the whole year; but, except in the rainy season, it is seldom heavy or lasting. The rainy season, the only variation of the tropical year, occurs when the sun is vertical, and generally continues from December to March; during this time the climate is more insalubrious and the sickness of the inhabitants greater than at any other period. Thunder and lightning are frequent, especially in the rainy season.

Hogs and dogs, and sometimes rats, were the only animals whose flesh was formerly eaten by the natives. The missionaries have introduced all our domestic animals; and all have succeeded very well, except the sheep. Many of the natives now possess hundreds of cattle, which, with their other produce, they sell, with mutual advantage, to the ships which touch at the islands for refreshments. Rabbits could not be preserved; cats have become common in houses, and are great favourites. The birds of these and the neighbouring islands are not distinguished by brilliancy of plumage or melody of song. There are however several varieties, and some of them in immense numbers. The most numerous class are the aquatic fowl. The albatross (*diomeda exulans*), the tropic bird (*phaeton æthereus*), several kinds of petrel, with others, abound in all the islands, especially in Borabora and Mauarua. Among the lakes are several kinds of heron; and wild ducks resort to the lagoons and marshes. There are several kinds of birds of prey, and a number of the woodpecker tribe, with some small paroquets of rich and splendid plumage. The turtle-dove is found in the inland parts of some of the islands, and pigeons among the mountains. Among the few singing-birds, the most conspicuous is that called by the natives *Omaomao*, which in appearance and note much resembles the thrush. Domestic fowl are abundant, and were found in the islands when originally discovered.

The Society Islanders are generally above the middle stature, but their limbs are much less muscular and firm than those of the Sandwich Islanders, whom in many respects they resemble; but they are more robust than the Marquesans, who are the most light and agile of the inhabitants of Eastern Polynesia. In size and physical power they are inferior to the New Zealanders, and more resemble the Friendly Islanders; but they as much lack the gravity of the latter as they do the vivacity of the Marquesans. The countenance of the Society Islanders is open and prepossessing, though the features are bold, and sometimes prominent. The facial angle is frequently as elevated as in the European, except where the frontal and the occipital bones have been pressed together in infancy. The prevailing complexion is an olive, a bronze, or a reddish-brown, equally removed from the jet-black of the African and Asiatic, the yellow of the Malay, and the red or copper colour of the aboriginal Americans: it is frequently a medium between the two latter colours. Considerable variety nevertheless prevails in the complexion of the population of the same island, and as great a diversity among the inhabitants of the different islands.

The mental capacity of the Society Islanders has hitherto been only partially developed. They are remarkably curious and inquisitive; and, compared with other Polynesian nations, may be said to possess considerable ingenuity, mechanical invention, and imitation. Totally unacquainted with the use of letters, their minds could not be improved by any regular continued culture; yet the distinguishing features of their civil polity—the imposing nature, numerous observances, and diversified ramifications of their superstition—the legends of their gods—the historical songs of their bards—the beautiful, figurative, and impassioned eloquence sometimes displayed in their national assemblies—and, above all, the copiousness, variety, precision, and purity of their language, with their extensive use of numbers, warrant the conclusion that they possess no mean mental capabilities.

By diseases, wars, infanticide, and the use of ardent spirits, the large population which these islands formerly contained was reduced to a mere remnant when the missionaries came among them, and was in rapid progress to extinction. The general adoption of Christianity put a stop to the evils in which this decline had originated; but for some years after, the number of deaths considerably exceeded the births. About the years 1819 and 1820, the births were nearly equal to the deaths, and since that period the population has been rapidly increasing. The latest information estimates the inhabitants of these islands at 18,000 or 20,000. Most of the natives can now read and write. Their moral conduct has become more regular, and their social condition much improved; they have acquired the knowledge of various useful arts, and profitable branches of commerce have been opened. Numerous vessels of from 30 to 80 tons burden are usefully employed in trade, and in maintaining an intercourse between the several islands. A press has for many years been actively engaged in supplying the natives with publications in their own language, suited to their wants and their condition.

(Ellis's *Polynesian Researches*; *Voyages* of Wallis, Cook, and Wilson; Tyerman and Bennet's *Voyage round the World*; William's *Missionary Enterprises*; the *Reports* and *Magazine* of the London Missionary Society, &c.)

SOCINIANS, SOCI'NUS, AND UNITARIANS. An opinion has occasionally found supporters, that Arianism had covertly maintained its ground in Italy, from its first appearance, until the time of the Reformation—an event which emboldened its adherents to appear openly. It is more probable, that as men are prone to turn from one extreme to another—in shaking off the fetters so long imposed upon them by the high objective system, and theurgical claims of the church of the middle ages,—men rushed into the opposite extreme of rejecting the central truth of Christianity, on the ground of the mystery which invests the subject. While the north of Europe was disturbed by the Anabaptists, and the insurrection of the peasantry, the south and centre also of this Continent put forth fruits, evoked in like manner by the fierce beats of that eventful time. As in Germany, Christian life, order, and decency were assailed; so in the south, the subtle minds of Hetzer (a Swiss) and Servetus (a Spaniard) were led to attack the ordinarily received doctrine of the Trinity, and consequently of the divinity and atonement of Christ.

The followers of Socinus, and the religionists connected with them, known as Unitarians, form the principal body of Anti-Trinitarians. Their opposition to the belief of Catholic Christians is based upon their rejection of the doctrines of the Trinity, or Three Persons in One Godhead—of the true divinity of the Son—and the important practical consequences on Christian life flowing therefrom. Among the general confusion and excitement of the Reformation, when antient land-marks were removed, and pillars of orthodoxy tottered, it is not strange that antient heresies should revive, and in a more systematic form than before, and supported (as of old) by men of piety, talents, and learning. Individual teachers of this class appeared about that time, first in Italy, the seat of cold classical learning and revived scepticism. From thence they found their way to Switzerland, where then, as now, scepticism and subjective rationalism were found to flourish by the side of deep piety; and to Poland and Transylvania, where political causes led to the favourable treatment of the new opinions.

The leading features of Socinianism will be treated elsewhere [THEOLOGY], so that for the present we shall confine ourselves to a brief account of the principal leaders, and the extension of their teaching into different countries. The most eminent were Michael Servetus, one of their most original thinkers (whose execution for heresy at Geneva, in 1553, must ever remain a blot upon the character of Calvin), and the two Sozzini. The elder of the two, Lælius Socinus of Siena, was born in 1525. He died at Zürich in 1562, leaving to his more celebrated nephew, Faustus Socinus (who died in 1604, aged 63), the task of reducing to a systematic form the tenets which they held. Faustus Socinus, who for these labours may be regarded as the founder of the Socinian party, was called as arbitrator, in 1578, from Italy and Switzerland to Transylvania, where Anti-Trinitarian opinions had been planted some years previously by George Blandvata, a Piedmontese exile. On visiting Poland, Socinus found his co-religionists settled in the town of Rakau, where they had published a Bible, the catechism known as the Racovian (the nearest approach to a confession of faith among this body), and other works. By the resolutions of the synods of Petrikow and Pinczow (held in 1563 and 1565) the Polish Anti-Trinitarians had withdrawn from communion with the other Christian bodies. For a time Socinus was refused admission into their community, on the ground of some differences of opinion. Subsequently however his popularity was such, that his fellow-religionists in that country preferred to be called by the name of their principal teacher, than by their former one of Unitarians, and which was still borne by the flourishing communities in Transylvania.

Starting as did the Unitarian or Socinian bodies from an exaggerated employment (in the opinion of most Catholic bodies) of the principle of private judgment, the unavoidable result soon appeared, in an abundance of discordant opinions on various points connected with the central one of their system. The declining years of Socinus were embittered and his popularity lessened by these and similar causes. But Faustus Socinus must be regarded as the founder of that party which has at least shaped and explained after its own peculiar fashion the doctrines of the Trinity, of the Divinity of Christ, of the need of a mediator and the atonement, of the power of repentance, of the sacraments, of grace, and of the eternity of punishment.

The Polish communities had reached their most flourishing condition during the first half of the seventeenth century. Expelled by a decision of the Diet from Poland in 1638, many joined the congregations in Transylvania. Others attempted to spread these opinions in Germany, Switzerland, Holland, and England. In the last-named country and the New England States, the principal seats of Unitarianism are to be found. Their views do not seem to have gained any remarkable ascendency among the multifarious denominations of Holland. German Rationalism has in many particulars arrived at the same conclusions as Unitarianism: it would be unjust however to confound the two. Even viewed in the most unfavourable light, simple Unitarianism has never fully rejected historical Christianity as its basis, although miserably deficient in its modes of critical interpretation. To quote the words of Guericke, 'Pelagian, Semi-Unitarian, rationalizing, as is the system of Unitarianism—it has entailed a far less amount of damage than modern Rationalism on the sum of Catholic teaching. A degree of respect for revelation, as well as for many great Biblical truths, appear to have restrained Socinus from pressing his views to those extremes at which subsequent writers have arrived.' In Switzerland, various circumstances tended to produce a religious system very widely prevalent for a time, identical in many respects with Unitarianism, or at least resembling it so closely as to draw forth the ironical compliment of D'Alembert, "that the theologians of Geneva had unconsciously become Socinians."

We stated before, that the principles of Unitarianism have nowhere struck root so deeply as among people of English origin. In consequence of the movements forced upon their body during the seventeenth century, the 'Institutio Christianae Religionis' had been dedicated to James I., by Moscorovius, but was publicly burned. Penal laws of excessive severity were enacted in this country at different times, and on some occasions carried so far into execution as to excite both shame and sorrow. But short of actual extermination, penal acts in matters of religion will be found to fail; and although the laws in question were not repealed until 1813, various Unitarian congregations were formed. Among the most conspicuous teachers were John Biddle (who died in prison in 1662), Emlyn (died 1741), and Lindsey and Christie, towards the close of the last century. Lindsey attracted much attention, by his attempt to convert the ritual of the Anglican church into a basis for Unitarian formularies. This attempt, and the tone of his biographer Belsham (himself a teacher of some celebrity), called up the indignant eloquence of Robert Hall. Hall's powerful and uniform testimony to Christian liberty gave additional weight to his keen strictures on the obtrusive and audacious unfairness of Lindsey's attempt.

No name in the annals of this religious community since the days of their early teachers has attained such celebrity as that of Priestley (died 1804). As an advocate of freedom, Priestley will command the respect of many; as the victim of violence and outrage, the sympathy of all; but his necessitarian and materialist views, when considered calmly, would seem to be of an unqualified mischievous tendency. Priestley's main line of attack on the distinctive doctrine of Catholic Christianity, was by an attempt to impeach the antiquity of this article, by showing its comparatively recent introduction. But his opinions called up a formidable antagonist in Bishop Horsley, whose great learning and greater powers were devoted to establishing the fact that the Catholic doctrine was that of the three centuries.

There is much worthy of notice, in what has occurred with regard to the profession of the fundamental tenet of Unitarianism. It is held not only in the religious societies expressly bearing this designation, but by some of the general (or Arminian) branches of the Baptist body; and (what at first may seem more singular) by parties who, professing in some degree Unitarian principles, still retain the name of Presbyterians, by which they have been long distinguished from the Independents and Baptists. It is well known, that while, on the one hand, the Baptists originally differed from the church of England in a matter of doctrine and faith, the Presbyterian and Independent bodies were at variance with her on points of ecclesiastical discipline, form, and government. But a curious commentary on the effects produced by a virtual absence of all symbolical formularies, may be drawn from the subsequent differences in the history of these bodies. Among English Presbyterians, the bond of union was the rejection of any approach to formal or symbolical orthodoxy; the object of their religious fellowship was the free and open discussion of religious truth. From the absence of any specific terms of communion (among the English Presbyterians) beyond an implied general *bonâ fide* profession of belief in Christ, admission was attended with no difficulty. Among the Independents, a fixed symbol and profession of faith prevented this indiscriminate admission. Early in the last century, Arianism was not only embraced, but openly acknowledged by many Presbyterian ministers in England. In London its doctrines were openly preached; and in Lancashire they were generally prevalent. (*Christian Reformer*, 1834.) This progressive tendency has been not only admitted, but maintained as a natural consequence. In order to establish the necessary connection between the Presbyterian and Unitarian bodies, it has been argued, that as in preceding years the operation of the great principle of English Presbyterianism had converted the Calvinism of the Presbyterians into Arminianism, so subsequently it might change their Trinitarianism into Arianism, Socinianism, or Unitarianism.

SOCORRO. [GRANADA, NEW.]

SOCOTRA, is an island in the Indian Ocean, situated about 200 miles from Cape Guardafui, the most eastern point of Africa. It lies between 12° 16′ and 12° 45′ N. lat., and between 53° 25′ and 57° 34′ E. long., and extends about 70 miles from west to east, with an average width of 15 miles. It contains 1100 square miles, being equal in extent to the state of Rhode Island, or the county of Gloucester.

Socotra consists of an elevated table-land, which occupies about four-fifths of the surface, and two plains, which lie south and north of the table-land. The general elevation of the table-land is between 700 and 800 feet above the level of the sea. Its surface is in many parts level for a considerable extent; many hills are dispersed over it, but they rarely constitute ridges, except a granitic range of mountains, which stands on the northern edge of the table-land, about four miles from the northern shores of the island, and extends about eight miles, between 54° 3′ and 54° 10′ E. long. This mountain-mass may have a general elevation of about 2000 feet, but the most elevated portion consists of numerous peaks, some of which rise to 5000 feet. This range may be called the Haggier Mountains, from the most elevated of its peaks. From the western extremity of this range a ridge of limestone runs off in a south-west direction, but without forming peaks. Near the mountains its height may exceed 2000 feet above the sea, but it decreases as it proceeds southward, and at its termination, about seven miles from the southern shores, it is not more than 1200 feet high. The hills which are dispersed over the surface of the table-land attain an elevation varying between 1000 and 2000 feet. On the more level parts of the table-land there are many wide depressions, which generally extend south and north, and form long valleys. As the water collects in these depressions, it forms temporary watercourses, which give nourishment to numerous bushes, and to a fine turf, so that they constitute the best pasture-grounds of the island. But these watercourses disappear when the rains have failed for some time, and this shows that the soil is unfit for producing grain. There are fields of dukkum (*Sorghum saccharinum*) only in a few places. Plantations of date-trees skirt the banks of the watercourses to a great extent in the eastern districts, but are rarely met with in the western districts. In the former the fields on which dukkum and cotton are cultivated are much more numerous. The table-land descends towards the plains generally with a very steep declivity, but in a few places it comes close to the sea, as at Ras (Cape) Shuab, the western extremity of the island, and at Ras Kattany, and near Ras Feling, on the southern coast. At the last-mentioned place the high cliffs skirt the shores for about eight miles.

The plain, which skirts the southern base of the table-land, is from two to three miles wide, and nearly level, but it is as arid and barren as the worst part of Arabia. The sand on the sea-shore is very fine, and is put into motion by every strong wind. The force of the south-west monsoon, to which the coast is exposed, has carried it inland, where it forms a continuous range of sand-hills parallel to the beach, and hence it has spread over the plain, so that in many places great quantities of sand are deposed at the very base of the table-land. The shores run in a continuous line without being broken by any inlet. The few inhabitants of this plain live by fishing; but they have no boats, and take only those fishes which remain in the depressions of the beach after the retreat of the high tides. The northern plain varies in width between two and four miles. It is not so low as the southern, nor so level, the surface being intersected by flat valleys in many places, and in others some masses of hills rise from 300 to 600 feet. Sometimes these hills, or rather small table-lands, occupy several square miles. The western districts of this plain, though less sterile than the southern plain, are more adapted for pasture than for cultivation, but the eastern districts have a superior soil, which is a reddish-coloured earth, covered at certain seasons with abundant grass, and well adapted for the cultivation of grain, fruit, and vegetables. In the valleys through which the streams flow there are extensive groves of date-trees, and numerous enclosures of dukkum, and some plantations of indigo and cotton, which are all in a thriving state. The vigorous vegetation with which the lower declivities of the Haggier Mountains are clothed indicates a superior fertility in that district. In general the soil of this northern plain is stony, but it is generally covered with a dwarfish bush about six feet high.

With the exception of a few rivulets which originate in the Haggier Mountains, few if any of the streams contain water all the year round. Hence the inhabitants are obliged to collect rain-water in reservoirs, but in most parts of the northern plain water is found at a distance of from eight to ten feet below the surface.

As no European in modern times has spent a whole year in Socotra, we are very imperfectly acquainted with the climate. In the first three months of the year, the mean temperature is about 70½°, and in June and July about 88°. Though within the range of the monsoons, it is differently affected by them from the neighbouring countries. The north-east monsoon brings dry weather to Hindustan and the eastern coast of Africa, but in Socotra during that monsoon it rains almost daily. During the south-west monsoon, on the contrary, the sky is generally clear and cloudless, and the stars shine with uncommon brilliancy. But before the setting in of the breeze a dense white canopy of clouds extends over the sky; the air however is perfectly dry. The north-east monsoon blows with a steady breeze, but that from the south-west commences with a force almost like a hurricane.

The principal commercial products are derived from the wild plants, and are the aloe and dragon's-blood. The aloe plant (*Aloe spicata* or *Socotrina*) in the western districts covers the hills for many miles, at an elevation of from 500 to 2000 feet above the plains. The dragon's blood tree grows in the same part of the island, at an elevation of from 800 to 2000 feet. These two plants are so abundant, that ten times the quantity which at present is exported could be collected in the island. There are several forest-trees, but none fit for timber. Yams grow wild in the Haggier Mountains, where also wild orange-trees are found, which probably have been introduced by the Portuguese. Dates are the only fruit-trees which are cultivated, and though numerous in the eastern districts, their produce is not equal to the consumption, and dates are imported from Muskat. Agriculture is limited to the cultivation of dukkum, a species of millet, beans and tobacco, with a little cotton and indigo.

There are no horses. Asses are only found in a wild state on the Haggier Mountains. They are probably the descendants of domestic animals. The camel is the only animal of burden, and is nearly as sure-footed as the mule; but there are only about 200 in the island. The cows are small, resembling in size the black Welsh cattle. They are only kept for their milk. Ghee forms one of the principal articles of export. Sheep and goats are numerous, especially in the western districts, where they constitute the principal wealth of the inhabitants. The sheep are small, but have a good wool, of which thick cloaks are made, which are well known in Arabia and Persia. There are several kinds of goats, and one of them is found in a wild state on the mountains: the flesh of this species is much prized by the natives. There are civet-cats all over the island, rats, mice, and chameleons. There are several kinds of vultures, and also the flamingo. Turtles are found on the southern coast. Fish abound in several parts of the coast, and some families live on the produce of their fishing.

The population is estimated by Wellsted at 4000 individuals, which, considering the large tracts consisting nearly of bare rocks, seems to be a very fair estimate. It consists of two different nations, of which one is foreign and the other apparently aboriginal. The former are called Socotran Arabs, and the latter Bedouins. The Arabs are a mongrel race, chiefly the descendants of Arabs who were left there by boats passing between Zanzebar and the Arabian coast, and have settled on the island. With these are intermixed the descendants of the Somaulies, or natives of the southern coast of the Gulf of Aden, of Portuguese, and of Arabian and African slaves. They generally understand the Arabian language, but usually speak that of the Bedouins. They are the only cultivators of the ground, but they also make ghee. They are zealous Mohammedans. The aborigines are called Bedouins in consequence of their pastoral habits and their wandering mode of life, though they differ widely from the Bedouins of Arabia in some points. Their language also appears to differ considerably from that of the Arabs. The mountaineers from the Arabian coast indeed are sometimes able to make themselves understood by the Bedouins of Socotra, but the Arabs from Muskat, or from any of the neighbouring towns, are quite unable to do so. They have no characteristics in common with the Arabs or Somaulies. They are tall, with strong, muscular, and remarkably well-formed limbs; a facial angle like that of Europeans, the nose slightly aquiline, the eyes lively and expressive, and the mouth well-formed. Their hair curls naturally, but does not approach to a woolly or crisp texture. Their general complexion is fair, but a few of them are as dark as the Hindus. The regularity of their features, the fairness of their complexion, and the symmetry of their bodies, render them a people distinct from any of the varieties seen on the shores of the continent on either side. They live on the produce of their sheep and goats, and collect aloes and dragon's-blood, which, together with ghee, they bring to the ports, where they exchange them for dates, dhurra, and clothes. As they frequently change their abodes, and live in a country not abounding in building materials, they inhabit the numerous caverns which are found in the limestone hills of their country. They are Mohammedans, but they do not show much zeal in the performance of their religious duties, nor are they tainted with the intolerance of the Arabs. They are divided into families or tribes, each occupying a determinate part of the island, and having a representative or head, who exercises what may be termed a patriarchal authority over them.

There is no place which can be called a town. The capital is Tamarida, which is built not far from the northern shores, and consists of about 150 straggling houses, of which however only one-third are inhabited. Wellsted thinks that the number of inhabitants cannot exceed 150.

Socotra was known to Ptolemy, who notices it under the name of Dioscoridis Insula, and Arrian says that the inhabitants were subject to the kings of the incense country. It was visited by the Portuguese Fernandez Perara in 1504, and taken possession of by Albuquerque in 1507. It is not known at what time the Portuguese evacuated the island but probably before the sixteenth century elapsed. It then returned under the sway of the sultan of Kisseen on the southern coasts of Arabia, and its peace was not interrupted until 1801, when the Wahabees made a descent on the northern shores, and laid waste a part of it, together with the town of Tamarida. The sultan of Kisseen is still the sovereign of the country, but all the advantages he derives from this possession are a few hundred dollars, which are annually collected by a person whom he sends to the island. On the other hand he maintains no regular administration, and the people live without any laws or courts of justice. It is stated that crimes are of rare occurrence.

(Wellsted's *Memoir on the Island of Socotra*, in 'Lond. Geogr. Journal,' vol. v.)

SO'CRATES, considered by some the founder of Greek philosophy, was born at Athens on the 6th of Thargelion, Ol. 77. 4 (B.C. 468). His father, Sophroniscus, was a sculptor; his mother, Phaenarete, a midwife. He was originally destined for his father's profession, and we are told that he made no slight proficiency in his art; statues of the Graces, clothed in flowing drapery, were exhibited in the Acropolis as his work. He did not however devote himself to this profession; he carried it on so far as to earn a decent subsistence from it, but as he inherited some little property on his father's death, he was content to devote the greater part of his time and talents to the study of philosophy, for which he had a strong natural inclination. While still engaged in statuary, and much more so after he had given it up, he spent a great part of his time in reading all the accessible works of former and contemporary philosophers. Crito supplied him with money to pay the masters who taught various accomplishments at Athens, and he became an auditor of most of the great physical philosophers and sophists who visited Athens during his time, especially of Anaxagoras, who was expelled from the city when Socrates was thirty-seven years old, his successor Archelaus, and the luxurious and accomplished Prodicus, of whom Xenophon makes him speak in terms of the warmest affection (*Mem.* ii., 1, sects. 21, 24). In a word, he may be considered as having received the very best education which an Athenian could command in those days. With regard to his public life, we know that he served his country faithfully as a soldier, according to the duty of all Athenian citizens. During the Peloponnesian war he made three several campaigns. In the first of these he took a part in the long blockade of Potidaea, and Alcibiades, in Plato's *Symposium* (p. 219, E, &c.) gives a full account, though perhaps rather a partial one, of his extraordinary hardihood and valour during this long service. He endured, with the greatest indifference, hunger and thirst, heat and cold; in one of the skirmishes which took place, Alcibiades fell wounded in the midst of the enemy; Socrates rescued him, and carried him off, together with his arms, for which exploit the generals awarded him the civic crown as the prize of valour (*τὰ ἀριστεῖα*); this however he transferred to Alcibiades. The scene of his second campaign was Bœotia, where he fought for his country in the disastrous battle of Delium. Here he saved the life of another of his pupils, Xenophon, whom he carried from the field on his shoulder, fighting his way as he went. On his third campaign he served at Amphipolis. On the merit of his civil services it is more difficult to form a decided opinion. As a member of the deliberative senate (*βουλή*), he showed great firmness in voting against the iniquitous sentence by which the victors of Arginusae were condemned to death. But there is too much reason to believe that he really belonged to the party of Theramenes, who was the chief mover in that and other unhappy proceedings. At any rate he did not leave Athens even when the tyranny of the Thirty had reached its height; he was employed by them as an agent in one of the most detestable murders which they perpetrated—that of Leon, and though he did not actually assist in seizing the fugitive, his reluctance to do so arose probably from a goodness of heart quite consistent with a general adherence to the party which had selected him as their instrument. That Socrates favoured the aristocratic or oligarchical faction at Athens—that, at least, he was not well disposed to the democratic constitution of his country, is proved, to a certain extent, by the fact that the indictment on which he was condemned and executed was brought forward by Anytus, one of the chief of those citizens who assisted Thrasybulus in restoring the old state of things. We are of opinion (and the subject is one on which many opinions have been entertained) that Socrates, though a thoroughly good and virtuous man, endued with great self-control, a strong sense of duty, wonderful amiability of disposition, and indeed with almost all those qualities which obtain for an individual the love and admiration of his fellows, was deficient in the higher kind of political virtue; that in fact he was not a good citizen, because, with every wish to obey the laws of the state, he could not refrain from broaching theories at variance with the first principles of a democratic constitution, because he could not prevail upon his intellectual convictions to bow before the supremacy of public opinion. That in the abstract he might have been in the right, while all Athens was in the wrong, is not the question. As laws, in a democratic state, are made by the majority, the voice of one man, or of a small class of men, though they may be all philosophers, will never justify the speakers in breaking through those rules, to which, as members of the body-politic, they are bound to submit. The Athenians were justified, by every principle of law which was acknowledged in those days, in the sentence which they passed upon Socrates, and it is only a matter of wonder that the votes of the judges were so nearly divided. An opinion generally unfavourable to him had for a long time been prevalent in Athens, and it is no slight evidence of this opinion being well-founded, that it was, in part at least, supported by Aristophanes, who introduced Socrates into his celebrated comedy, 'The Clouds,' as a mischievous speculator on matters of religion, and as a corrupter of the youth of Athens—as, in fact, one of the class of Sophists. Although there can be no doubt that the comedy just mentioned had no share in producing the condemnation of Socrates, it is at least remarkable that the two principal charges brought against him on his trial constitute the leading features in the satirical censure of Aristophanes. The accusers, Meletus, Anytus, and Lycon, state their charges as follows: 'Socrates is guilty of impiety in not acknowledging the gods acknowledged by the state, but on the contrary, introducing new deities: and he also does wrong in corrupting the youth.' It would be easy to confute the arguments by which Xenophon seeks to justify his master from these charges, and if we only put ourselves in the place of the Athenians, we cannot wonder that a small majority of judges were compelled by their duty to pronounce him guilty. It does not however follow that he would have been put to death in consequence of this conviction. But on being called up to receive his sentence, he treated the court with a contumelious disdain, which was not only at variance with Attic law, but also eminently calculated to provoke his judges, who were accustomed to the most humble and abject demeanour on the part of those who were brought before them, and who could ill brook the irony and ridicule of a condemned criminal. He was sentenced to death by a much larger number than those who had voted him guilty. The festival of the Theora gained him a reprieve of thirty days, during which his friend Crito provided for him the means of escaping from prison, but he would not avail himself of the opportunity. His sentence was carried into execution at the end of the month Thargelion, Ol. 95. 1 (B.C. 399). If we may believe the account given us by a friend and disciple of his, he met his fate with the most heroic calmness and resignation, discoursing with and consoling his weeping friends, even after he had drunk the cup of hemlock, and expressing with his last breath his debt of gratitude to Æsculapius for having at length supplied him with a cure for all earthly ills.

The philosophical merits of Socrates are less doubtful than his political character. The mere fact that he is made the chief interlocutor in those wonderful dialogues which contain the whole system of Plato, is sufficient to prove that he exerted no slight influence on that great philosopher, and though he never committed any of his own thoughts to writing, he has left indisputable traces of the important innovations in science, of which he must be considered as the real and first author. We have three authorities for the doctrines of Socrates: Xenophon's 'Memorabilia;' the 'Dialogues' of Plato; and the 'Strictures' of Aristotle. With regard to the first work, too much reliance has been placed upon it as a faithful delineation of the sayings of Socrates. It is too much of an apologetic nature to deserve the title of a just and accurate exposition of the doctrines which it defends; and even if Xenophon had wished to give a full account of the philosophy of Socrates, it is not possible, from all that we know of him, that he would have been able to do so. His talents, such as they were, were all of a practical nature; he does not seem to have had any toleration for philosophy; he clearly did not understand the definition of terms or ideas; and at any rate had not originality enough to enable him to appreciate such a thoroughly original character as Socrates.

As to Plato, there can be no doubt that he never meant to pass off as his own the doctrines and speculations which he puts into the mouth of Socrates; but we cannot help feeling that the Socrates, whom he represents with such dramatic truth, must have been a real person, and no creature of the imagination, and that Socrates must have been the philosophical as he is the formal basis of all that Plato has done for science. If then we seek to make up for the deficiencies of Plato and Xenophon, as exponents of the doctrines which their master actually promulgated, by turning to the criticisms of Aristotle, we shall find that Plato gives us a much truer conception of what he effected by his scientific labours, than we could have derived from Xenophon. Aristotle distinctly tells us that Socrates philosophised about virtue, and made some real discoveries with regard to the first principles of science. Now this is just the philosophical basis which we discern in the Socrates of Plato. We find him always endeavouring to reduce things to their first elements, stripping realities of their pompous garb of words, and striving to arrive at certainty as the standard of truth; and we also find that his philosophy is generally applied to ethics rather than to physics. He seems to have been convinced of the unity of virtue, and to have believed that it was teachable as a matter of science. In fact, with him the scientific and the moral run into one another, for knowledge is the final cause of the will, and good is the final cause of knowledge; hence he who knows what justice is, must needs be just, since no one wittingly departs from that which he knows to be good. Socrates considered it to be his particular vocation to arouse the idea of science in the minds of men. This is clear from the manner in which he is said to have insisted upon the consciousness of ignorance, and also from the use which he made o the Delphic response, γνῶθι σεαυτόν, 'Know thyself.' 'For,' says Schleiermacher (in his valuable paper on the 'Worth of Socrates as a Philosopher'), 'if he went about in the service of the god, to justify the celebrated oracle, it is impossible that the utmost point he reached could have been simply to know that he knew nothing; there was a step beyond this which he must have taken, that of knowing what knowledge is. For by what other means could he have been enabled to declare that which others believed themselves to know, to be no knowledge, than by a more correct conception of knowledge, and by a more correct method founded upon that conception? And everywhere, when he is explaining the nature of non-science (ἀνεπιστημοσύνη), one sees that he sets out from two tests: one, that science is the same in all true thoughts, and consequently must manifest its peculiar form in every such thought; the other, that all science forms one whole. For his proofs always hinge on this assumption—that it is impossible to start from one true thought and to be entangled in a contradiction with any other, and also that knowledge derived from any one point, and obtained by correct combination, cannot contradict that which has been deduced in like manner from any other point: and while he exposed such contradictions in the current conceptions of mankind, he strove to rouse those leading ideas in all who were capable of understanding or even of divining his meaning.' In all the isolated particulars which are recorded of Socrates, this one object is everywhere discernible. His antagonistic opposition to the Sophists is one very strong feature of this. They professed to know everything, without having the idea of science, or knowledge of what knowledge is, and as he had that idea without the mass of acquirements on which they prided themselves, he was naturally their opponent, and his strife with them is carried on entirely in this way, that he endeavours to nullify the effects of their acquired knowledge by shifting the ground from the objects to the idea of science, whereby he generally succeeds in proving their deficiency in the one thing needful to the philosopher. His irony, as it is called, is another remarkable proof of his devotion to his vocation as an awakener of the idea of science. The irony of Socrates has been well described as the co-existence of the idea of science in him, with the want of clear and complete views on any objects of science—in a word, as the knowledge of his ignorance. With this is intimately connected the indirect dialogical method which he invariably adopted, and which may be considered as his method of extracting scientific truth from the mass of semblances and contradictions by which it was surrounded. His *dæmonion*, or secret monitor, which was a great puzzle to his contemporaries, as it has been to many of the moderns, seems to have been little more than a name which he gave to those convictions on practical subjects which sprung up spontaneously in his mind, and for which he could not find any satisfactory means of accounting, though he felt himself constrained to follow in the course which they prescribed, as when he felt convinced of the issue of an undertaking, or was restrained by some secret misgiving from taking a certain route on his retreat from a disastrous battle.

Such are the leading outlines of the philosophy of Socrates, so far as they are capable of being established with any certainty. The importance of his doctrines is most clearly perceived when we consider them as they were developed and applied by the various schools which acknowledged him as their founder, and especially as they were carried out by Plato. [Cynics; Cyrenaics; Megarians; Plato.] In all these schools, we find, along with the purely Socratic element, some foreign admixture which constitutes the diagnosis of the different systems, and it is not a matter of wonder that no school of Socratic philosophy merely adopted the principles and method of its great founder. A thoroughly original man like Socrates would naturally gather around him all the original and thinking men who fell in his way, and his business was best done by making them all think for themselves and work by themselves on the idea of science which he had awakened in their minds. The Socratic impulse being once communicated, it would take a different direction according to the character and natural bias of the subject on which it operated, and though Socrates may be considered as the basis of the whole superstructure, he can have no more claim to the whole merit of the Platonic philosophy than he is entitled to be blamed for the reckless inconsistencies of Alcibiades or the selfish policy of Xenophon.

In person, Socrates was no less singular than he was in manners and dress He had large projecting eyes, a sunken nose turned up at the end, with wide dilated nostrils, and a great unwieldy belly; so that his appearance was not unlike that of the Silens and Satyrs, whom he also seemed to resemble in the severe mockery of his ironical language. His dress was coarse and inelegant, and he seldom wore shoes. If we add to this, that as he walked along the streets he strutted about in a most haughty supercilious manner, staring to the right and left at every one he met, sometimes stopping suddenly in an absent fit and remaining for a considerable time fixed to the spot, we shall not wonder at the selection which Aristophanes made of him as a fit and proper subject for the caricature of comedy.

SODA. [Sodium.]

SODA'DA has been named from *sodad*, the Arabic name of a shrub found in Egypt, as well as everywhere in the province of Yemen in Arabia. It was considered by Forskal, the discoverer, to be a distinct genus which belongs to the natural family of Capparideæ. It is now arranged only as a subgenus under Capparis [Capparidaceæ], distinguished by having concave leaflets of the calyx, stamens indefinitely numerous, berry ovate. It requires mention only as the unripe fruit is cooked and forms an article of diet among the Arabs. The same plant is known in Egypt by the name *Hombuc*: it forms a shrub with thorny nearly leafless branches.

SODALITE occurs crystallized and massive. Primary form the cube, but usually met with in rhombic dodecahedrons, parallel to the planes of which it is cleavable. Fracture conchoidal, uneven, with a vitreous lustre. Hardness sufficient to scratch glass easily. Colour white, grey, greyish-green, and green. Streak white. Lustre vitreous. Transparent; translucent. Opaque. Specific gravity 2·295 to 2·37.

Massive Varieties, amorphous. Structure granular, compact.

When heated by the blowpipe, the edges are rounded with difficulty, and without any other alteration. With borax dissolves into a colourless transparent glass with great difficulty.

It is found in Greenland, in Mount Vesuvius, and in Siberia.

Analysis of the Vesuvian mineral by Arfwedson:—

Silica	35·99
Soda	26·55
Alumina	32·59
Muriatic Acid	5·30

SODDOMA, IL. [Razzi.]

SÖDERHAMN. [Sweden.]

SÖDERKÖPING. [Sweden.]

SÖDERMANLAND. [Sweden.]

SÖDERTILGE. [Sweden.]

SO'DIUM, a metal, the base of the alkalis soda, natron, and the fossil alkali, in which substances it is combined with oxygen, forming the protoxide of the metal.

Sodium was discovered by Sir H. Davy in 1807, and the method by which he obtained it is perfectly similar to that by which he procured potassium [Potassium], which it strongly resembles in many properties. It will of course be understood that in the latter case the alkali soda in the state of hydrate was substituted for hydrate of potash. Gay-Lussac and Thénard soon afterwards procured it in greater quantity by decomposing soda by means of iron, as already pointed out. [Potassium.] It is stated by Schœdler, that it may be economically procured by mixing one part of acetate of soda, which has been decomposed by ignition, with half its weight of coarsely-powdered charcoal, and one-fourth of finely-powdered charcoal, and then heating the mixture in an iron retort with the usual recipients for the product.

The properties of sodium are such as to prevent its occurrence in nature, except in combination. Immense quantities occur combined with chlorine, forming common salt; and considerable quantity is met with in the state of oxide, or soda, combined with carbonic acid: these are its principal sources.

Sodium has a colour and lustre resembling those of silver. It remains a soft solid at 32°, so that small portions may be welded together by pressure; it becomes much softer at 122°, fuses at about 190°, and by a white heat it is volati tion. Like potassium, it speedily tarnishes by exposure to the air, owing to its great affinity for oxygen, and this occurs more rapidly when the air is moist, and it requires for preservation the same precautions as have been mentioned with regard to potassium. It does not, like that metal, inflame when thrown upon water, but decomposes it with a hissing noise, the results being hydrogen and oxide of sodium, or soda, which, remaining in solution, exhibits the well-known alkaline character of that substance. When however it is placed on a moistened bad conductor of heat, as charcoal, it decomposes water with vivid combustion. Its specific gravity is 0·972, so that although it is considerably more dense than potassium, it is yet less so than water. It is a good conductor of electricity and heat; but if too strongly heated in the air, it burns with a yellow flame.

Sodium combines with all the elementary gaseous bodies, two of which, namely, those with oxygen and chlorine, are of great importance and utility.

Oxygen and Sodium form two compounds, protoxide and peroxide of sodium; the *former* of these has been long known, and extensively used in various arts and manufactures for many centuries. It was formerly called the *fossil alkali*, to distinguish it from potash, which, as being procured by the incineration of wood, was called the *vegetable alkali*; the peroxide has been discovered only since the metal was known.

Under the head of carbonate of soda we shall briefly mention the processes by which soda is procured for manufacturing purposes, stating merely at present that protoxide of sodium, or anhydrous soda, is prepared by heating the metal in sufficient dry oxygen gas, taking care that there is no excess, for if there be, then some peroxide will be formed; soda obtained, it is a grey solid, resembling potash in appearance, but it is less fusible and volatile. It is extremely acrid to the taste, and is very caustic. It has great affinity for water, dissolving readily in it, and in large quantity, and the solution has strongly marked alkaline properties.

Sodium differs remarkably from potassium in some respects: thus while both become first alkaline oxides, and afterwards carbonates, by exposure to the air, the carbonate of soda remains dry, while that of potash becomes fluid, owing to the absorption of water.

Sodium, as has already been noticed, is oxidized by decomposing water, and the solution of soda obtained, when evaporated to dryness, leaves hydrate of soda. This is a solid white substance, greatly resembling soda in appearance and properties. It retains the water with so great affinity, that it cannot be expelled by heat.

Soda, or protoxide of sodium, is composed of—

One equivalent of oxygen . . .	8
One equivalent of sodium . . .	24
Equivalent . . .	32

The hydrate is composed of one equivalent soda and one equivalent of water (32 + 9).

Soda is met with in some mineral substances, but not so commonly as potash. It is found however in albite, or cleavelandite, a constituent of granite resembling felspar, except that it contains soda instead of potash.

Peroxide of Sodium.—This compound is formed by heating sodium in more oxygen gas than is required to convert it into a protoxide. It burns vividly, extricating much light and heat; the peroxide resulting is of a yellowish-green colour. When put into water, it is decomposed, oxygen gas being evolved, and soda, or protoxide of sodium, remaining in solution.

According to Davy it is a sesqui-oxide consisting of—

One and a half equivalent of oxygen .	12
One equivalent of sodium . . .	24
Equivalent . . .	36

The later experiments of Millon make it a compound of—

Two equivalents of oxygen . .	16
One equivalent of sodium . . .	24
Equivalent . . .	40

It is not applied to any use, and, being decomposed by water, it does not form salts with acids.

Chlorine and Sodium form only one compound, the important one, common salt, formerly called muriate of soda, and now chloride of sodium. Of all natural soluble salts this occurs in the greatest quantity. It is met with solid, constituting rock salt, in solution in salt springs and in the ocean, and in small quantity in almost all spring and river water. [SALT-TRADE.]

This salt may be obtained artificially, either by the direct action of chlorine gas on sodium, or by saturating hydrochloric acid with soda; by evaporating the solution, common salt is obtained, which, in whatever manner or from whatever source procured, has, when pure, the following properties:—it is colourless, inodorous, has a purely saline taste unmixed with bitterness; is transparent, brittle, and easily reduced to powder; its specific gravity is about 2·125; when exposed to moist air, it deliquesces; it crystallizes in cubes, which form under common circumstances is but little subject to modification. It is almost as soluble in cold water as in boiling. Water at 32° dissolves more than at 60°; the experiments of Gay-Lussac show that 100 parts of water at 56° dissolve 36 of salt, and in a boiling saturated solution, the temperature of which is 225°, 100 parts of water hold 40·38 of salt in solution. According to Berzelius, the quantities are very nearly 35·4 and 37·1. A saturated boiling solution does not deposit crystals on cooling, evaporation being necessary to produce this effect; in pure alcohol it is insoluble. At a red heat common salt fuses, and on cooling it becomes a transparent brittle mass; the crystals contain no water of crystallization, but decrepitate strongly when heated, owing to the expansion of mechanically interposed water. At a bright red heat it sublimes in the air, and tinges flame of a blue colour.

Chloride of sodium is composed of—

One equivalent of chlorine .	36
One equivalent of sodium .	24
Equivalent .	60

The uses of this salt have been known from the earliest ages. It is employed not only in seasoning food, but in preserving meat from putrefaction. It is used occasionally as a manure. In chemical manufactures it is employed for preparing hydrochloric acid, sulphate and carbonate of soda, and several other salts, as hydrochlorate of ammonia and the chlorides of mercury, and in the preparation of soap.

Sodium combines with fluorine, bromine, iodine, sulphur, phosphorus, &c.; but the compounds which they form are not very important, not being extensively applied to any purposes whatever. We shall therefore proceed to consider the properties of some of the more useful

SALTS OF OXIDE OF SODIUM, OR OXISALTS OF SODA.

It is perhaps scarcely requisite to state that these salts are never prepared by directly acting upon the metal sodium, although for purposes of curiosity they might all of them be so procured. The first which we shall notice is—

Nitrate of Soda.—This salt may be prepared either by adding the metal, or soda, its oxide, to nitric acid; as a natural product it has however of late years been largely imported from Peru, where it forms a stratum of some miles in extent. This salt has a cooling saline taste, is inodorous and colourless; in a moist atmosphere it deliquesces; it readily crystallizes, and the form of the crystal is an obtuse rhomboid; so obtuse indeed, and so near a cube, that the salt was originally called *cubic nitre*, to distinguish it from potash nitre, the crystals of which are prismatic. According to Gay-Lussac, 100 parts of water at 32° dissolve 73 parts of this salt; and at 212°, 173 parts. Berzelius says that water at 60° dissolves half its weight. It is sometimes found with crude nitrate of potash.

Like nitrate of potash, it deflagrates with charcoal; but owing to its property of attracting moisture, it cannot be used in the manufacture of gunpowder. It is however used largely in making nitric acid, sulphuric acid, and as a manure.

Nitrate of soda is anhydrous, and is composed of—

One equivalent of nitric acid .	54
One equivalent of soda . .	32
Equivalent .	86

There are three compounds of carbonic acid and soda, the carbonate, sesqui-carbonate, and bi-carbonate.

Carbonate of Soda.—This salt, formerly called *subcarbonate of soda*, was obtained from barilla [BARILLA] or kelp [KELP]: the former being the ashes of the *Salsola soda*, and prepared in Spain; the latter the ashes of burnt sea-weed, manufactured in Scotland. Since the duty has been taken off common salt, carbonate of soda is now prepared, for the numerous uses to which it is applied, by first converting common salt into sulphate of soda by means of sulphuric acid, and then treating the sulphate with small-coal and chalk in a reverberatory furnace: the result is a mixture of carbonate of soda and sulphuret or perhaps oxi-sulphuret of calcium; and when this is treated with cold water, the sulphuret remains undissolved, while the carbonate of soda is taken up by the water, and by evaporation to dryness what is called *soda ash* is obtained; while by due evaporation crystallized carbonate of soda is formed.

This salt, when obtained by evaporation, is a colourless inodorous powder; it is devoid of smell, but has a disagreeable taste, though less so than carbonate of potash; it is readily soluble in water; does not deliquesce when exposed to the air. The primary form of this substance, when crystallized by moderate evaporation of the solution, is an oblique rhombic prism. The crystals are frequently very large. They contain about 62 per cent. of water, the greater part of which they lose by exposure to the air, and efflorescing, fall to powder. At high temperatures the salt becomes fluid and boils. Water at 60° dissolves half its weight of carbonate of soda, and boiling water considerably more. The solution possesses the alkaline property of turning vegetable yellows brown. Like other carbonates, this salt is decomposed by the stronger acids, with effervescence of carbonic acid; and by lime, which separates its carbonic acid, it is rendered caustic.

Carbonate of soda is composed of—in the state of crystals—

One equivalent of carbonic acid .	22
One equivalent of soda . . .	32
	—
One equivalent . .	54
Ten equivalents of water . . .	90
	—
Equivalent of crystals .	144

The quantity of this salt prepared and used is enormous; it is required in making soap, and crown and plate glass, and for numerous other purposes.

Sesqui-carbonate of Soda.—This compound is found native in Hungary, and also near Fezzan in Africa. By the natives it is called *Trona*. It is found in hard striated crystalline masses, and it is not altered by exposure to the air, but is readily soluble in water.

This salt appears to be formed when a solution of the carbonate of soda is heated with carbonate of ammonia, and probably also when a solution of the bi-carbonate is heated. Its taste is less alkaline than that of the carbonate, into which it is converted, when strongly heated, by losing one-third of its carbonic acid.

It is compose of—

One equivalent and a half of carbonic acid	33
One equivalent of soda . . .	32
Two equivalents of water . . .	18
	—
Equivalent . . .	83

It is used in medicine, and it is stated that in Africa it has been used for building walls.

Bi-carbonate of Soda.—This salt is formed by passing carbonic acid gas into and through a solution of the carbonate of soda; a crystalline granular compound is formed, which consists of—

Two equivalents of carbonic acid . .	44
One equivalent of soda . . .	32
One equivalent of water . . .	9
	—
Equivalent . .	85

This salt has a very slightly alkaline taste, and it acts very feebly on turmeric-paper. It requires about twelve times its weight of water for solution. When the solution is boiled, it loses one-fourth of its carbonic acid, and is converted into sesqui-carbonate; at a red heat it loses all its water and half its carbonic acid, and is then carbonate of soda. It resembles the sesqui-carbonate in giving no precipitate with the salts of magnesia till heated; and they both differ from the carbonate in this respect. It is used in medicine. This salt dissolved in water is called *soda-water*, when an additional quantity of carbonic acid has been forcibly combined with it.

Sulphate of Soda, formerly called Glauber's salt, may be formed by the direct combination of the acid and alkali; it is however generally prepared by decomposing common salt, in the preparation of hydrochloric acid, or for making carbonate of soda. It has also been met with in nature, but not largely.

This salt is readily soluble in water, and the solution by evaporation yields colourless transparent prismatic crystals, the primary form of which is an oblique rhombic prism. It has a very bitter taste; effloresces when exposed to the air, by losing water of crystallization. Boiling water dissolves its own weight of this salt, and water at 60° one-third of its weight. It is insoluble in alcohol. When exposed to heat it first undergoes watery fusion, by melting in its water of crystallization; when the water has been expelled, it becomes opaque white, and at a red heat it melts.

It is composed of—

One equivalent of sulphuric acid . .	40
One equivalent of soda . . .	32
	—
Equivalent . . .	72
Ten equivalents of water . . .	90
	—
Equivalent of the crystals .	162

It is employed in medicine, but much more largely in the preparation of carbonate of soda.

Phosphoric Acid combines with soda to form several compounds; for an account of which we refer to Brand's 'Manual of Chemistry.' No one of them is extensively employed.

Borate of Soda is a compound of boracic acid and soda. [BORAX.]

Acetate of Soda is a salt prepared by saturating the acid with the alkali or by double decomposition with acetate (pyrolignite) of lime and sulphate of soda. This salt has a saline but not a disagreeable flavour; it is colourless, inodorous, and crystallizes in oblique rhombic prisms; the crystals are soluble in three times their weight of cold water, and much more so in hot; when heated, it first melts in its water of crystallization, and at a red heat it is decomposed and converted into carbonate of soda. It is employed in the preparation of acetic acid and of sodium.

It consists of, in its crystallized state—

One equivalent of acetic acid .	61
One equivalent of soda . .	32
Six equivalents of water . .	54
	—
Equivalent . .	137

For an account of numerous other salts of soda we must refer to chemical authors; those whose properties we have detailed being merely the most useful.

General Properties of the Salts of Sodium.—Unlike the salts of potash, there is no acid nor any metallic oxide which forms an insoluble compound with the salts of soda, so that they cannot be precipitated in combination from solution. The best mode of distinguishing between these two-alkalis is, to convert them into their respective sulphates or nitrates, and compare their distinctive characters.

SODIUM, *Medical Properties of the Preparations of*. This, when in the state of an oxide, is termed the mineral alkali, in contradistinction to potash, or the vegetable alkali: both however are found in plants, though the former exists in large quantity only in plants growing in the sea, on the sea-coast, or inland salt-marshes. In the form of the chloride of sodium, common or table salt, it is one of the most abundant principles in the mineral kingdom. It also exists in many fluids in the animal kingdom, such as the blood and urine, particularly in man.

It possesses the ordinary qualities of a fixed alkali, but notwithstanding the resemblance it has to potash, the preparations, even with the same acid, present some differences which may be here pointed out.

In the oxidized state, or soda (pure or caustic), it is not employed in medicine to counteract acidity; nor in surgery to form an ulcer or to open abscesses, though for this latter purpose it possesses some advantages over hydrate of potash, inasmuch as it is not liable to spread or run.

It is only when in combination with carbonic acid that it is used to correct acidity. It exists in three states, viz. carbonate, sesqui-carbonate, and bi-carbonate: the causticity of these is less in proportion to the increase of the acid. These preparations, administered in various ways, but chiefly in solution, are much used to counteract real or presumed acidity of the stomach. The abuse of the analogous preparations of potash has been already pointed out. [POTAS soda]. The same caution is necessary as to soda-water (when that really contains any carbonate or bicarbonate of soda, as it not unfrequently consists only of carbonic acid compressed into the water). The saline draughts so commonly employed in the medical practice of this country are liable to the same objection, and in all cases of debility, especially in the phosphatic diathesis, do infinite harm. For an opposite reason, they are extremely serviceable in all inflammatory complaints: the period when they should be discontinued can only be determined by an intelligent medical attendant.

The preparations of soda possessed of purgative properties are—the sulphate, or Glauber's salts, the phosphate, and the triple salt, called soda-potassio-tartras, or Rochelle salts, of which potash is also a constituent. Of these it is only necessary to observe that of the sulphate a much larger dose is required than of the corresponding salt of potash; and that the phosphate, being nearly tasteless, and extremely mild in its action, is a very proper aperient for delicate persons. A nearly similar character belongs to the Rochelle salt; but as this is decomposed in the stomach, it is as hurtful as the common saline draughts in cases of debility, though very beneficial in inflammatory disorders, particularly in both acute and chronic duodenitis. The same remark is applicable to the so-called Seidlitz powders formed with Rochelle salt and bi-carbonate of soda, to which, when dissolved, a solution of tartaric acid is added, and the mixture drunk in the state of effervescence. The most quickly acting aperient is a Seidlitz powder dissolved in warm water; this is most proper at the commencement of common colds, influenza, and inflammatory diseases, but it should not be repeated without medical sanction, especially in influenza, where extreme debility speedily ensues.

The preparations of soda possessed of diuretic properties are the bi-borate and the acetate. The former of these has been already treated of [BORAX], and the second is rarely used, though, from not deliquescing, it has the advantage over acetate of potash, that it can be administered in the form of powder.

Chloride of sodium possesses purgative and emetic properties, which render it useful as a domestic remedy. Its other uses have been already pointed out. [BATHING; ANTHELMINTICS; FOOD.]

Chloride or hypochlorite of soda is a powerful disinfecting agent. [ANTISEPTICS.]

SODOM, an ancient city of Palestine, which, with Gomorrah, Admah, Zeboim, and Bela or Zoar, formed the five 'cities of the plain,' four of which were destroyed by fire from heaven for the wickedness and vices of their inhabitants, in the time of Abraham. (*Gen.*, xix.)

It has usually been assumed that the Dead Sea has existed only since the destruction of Sodom and the other cities; and of late years the favourite hypothesis has been, that before that time the Jordan had flowed through the whole length of the Wady-el-Arabah to the Gulf of Akaba, and that the present bed of the Dead Sea was a fertile plain. But from the recent discoveries of Dr. Robinson, we learn that this could not have been the case, at least not within any historical period. This traveller found that the Arabah, through which the Jordan was supposed to have once passed southward to the eastern arm of the Red Sea, actually sends its own waters northward into the basin of the Dead Sea; and that the waters of the high western desert, far to the south of the Arabah, all flow in the same direction. 'Every circumstance goes to show that a lake must have existed in this place, into which the Jordan poured its waters long before the catastrophe of Sodom. The great depression of the whole broad Jordan valley and of the northern part of the Arabah, the direction of its lateral valleys, as well as the slope of the high western desert towards the north, all go to prove that the configuration of this region in its main features is coeval with the present condition of the surface of the earth in general, and not the effect of any local catastrophe at a subsequent period.'

But although it appears that the Dead Sea existed before the destruction of Sodom, it is also concluded that the lake then covered a considerably less extent of surface than at present, and that Sodom and the other cities stood in what is now the southern portion of the lake, which portion is even now sufficiently distinguished from the main body of the water. That Sodom was at the southern extremity of the lake is shown by the fact that it was near to Zoar (to which Lot fled, and which was spared); and the name of Zoar is now recognised at a spot almost at the southern extremity of the present lake. The fertile plain therefore in which Sodom is described as having been situated, and which 'was well watered, like the land of Egypt,' lay to the south of the lake 'as thou comest unto Zoar.' Even to the present day more living streams flow into the Ghor, at the south end of the lake, from the wadys of the eastern mountains, than are to be found so near together in all Palestine; and the tract, although now mostly desert, is still better watered through these streams, and by the many springs, than any other district throughout the whole country.

(Robinson's *Biblical Researches in Palestine*, ii. 601, et seq.)

SOFA'LA is a country on the east coast of Africa, extending from Cape Corrientes on the south (24° S. lat.) to the vicinity of the river Luabo, the most southern arm of the Zambesi (19° S. lat.). As the country, except in two or three places on the coast, where small Portuguese settlements are found, is occupied by small independent tribes, it is impossible to assign to it a western boundary. This country, together with the province of Senna [SENNA], was formerly known by the name of Monomotapa, and was noted for the quantity of gold which was supposed to exist there. It has sometimes been considered to be the Ophir of Solomon, whence his fleets returned laden with 'gold and precious stones.' [OPHIR.] At present the name of Monomotapa is antiquated, and the few gold-mines which exist are included in the province of Senna. [SENNA, vol. xxi., 239.]

The coast is low, and so beset with shoals and sandbanks, that it is very difficult of access for large vessels. Along the coast are several islands, as the Bazaruto Islands, and Chulawan, which is sixteen miles in length, and is nearly divided into two parts by a salt creek, which opens into the small channel that separates it from the mainland.

The mouths of several rivers have been visited. The most northern is the river Boozy, commonly called *Jeiza*, which falls into a large shallow bay called Massangasey. Then follows the river of Sofala, forming at its mouth a tolerable harbour, which however is very difficult of access on account of the bar. Farther south is the river Savey or Sabia, and then the Sawoora, which falls into the great bay of Mamoone. These two rivers are hardly navigable for boats at their entrance, but are stated to be large rivers in the interior. The most southern river is Inhambane, which is easy of access, and makes a superb harbour, but is scarcely navigable for ships beyond the town, eight miles from the entrance; and five miles farther up it is not navigable even for boats.

Ivory and bees'-wax constitute the principal if not the only articles of export: they go to Mozambique. When the inhabitants have had a war with their neighbours, a few slaves are brought to the settlements.

The native tribes are very warlike. They are not acquainted with fire-arms, and use only spears and shields made of hide. They are divided into numerous tribes, and their chiefs come annually to the Portuguese settlements, where they receive some trifling presents.

The most northern of the Portuguese settlements is Sofala, which consists only of a paltry fort and a few miserable mud huts. At the mouth of the river Sabia a serjeant and six men are stationed. The most important settlement is Inhambane, which is a small trading town with tolerably good buildings. The Portuguese population, exclusive of the military, is only twenty-five, but the coloured inhabitants are numerous.

Sofala was visited by Pedrão Cavalhão, a Portuguese, before the way to India by sea was known. He went there by the way of the Red Sea and Calicut, in 1486, a year before Bartolomeo Diaz succeeded in reaching the Cape of Good Hope. Albuquerque took possession of it, and in 1505 the fort of Sofala was built. The Portuguese have always remained in possession of the country; but in proportion as their power in the East Indies decreased, the importance of these settlements was lessened, and in consequence they have been neglected.

(Capt. Owen's *Narrative of Voyages to explore the Shores of Africa, Arabia, and Madagascar.*)

SOHAM. [CAMBRIDGESHIRE.]

SOHO. [BIRMINGHAM.]

SOIL. Wherever the surface of the earth is not covered with water, or is not naked rock, there is a layer of earth more or less mixed with the remains of animal and vegetable substances, in a state of decomposition, which is commonly called the *soil*.

The nature and composition of the soil, and consequently its greater or less aptitude to the growth and maturity of vegetable productions, depend chiefly on the proportion and mechanical structure of the various substances of which it consists. When the soil is favourable to the chemical action by which the elements are combined to form vegetable substances, and admits that quantity of air and moisture without which this chemical action cannot take place in any given climate or temperature, vegetation goes on rapidly, and all the plants which are suited to the climate grow in the greatest perfection, and bear abundant fruits.

It is not however very frequently the case that a soil possesses all those qualities on which great fertility depends. So many circumstances must concur to make a soil highly fertile, that the great majority of soils can only be made to produce abundantly by being improved by art both in their texture and composition. Hence the practice and science of agriculture, which is founded on experience, but to which every progress in science also affords great assistance, by the additional light which every new discovery throws on the true theory of vegetation.

There are various modes of distinguishing soils, without entering into a minute analysis of their component parts. The simplest and most natural is to compare their texture, the size and form of the visible particles of which they are composed, and to trace the probable source of their original formation from the minerals which are found around or below them, or the rocks from which they may have been slowly separated by the action of the elements. The science of geology, which teaches the relative position and nature of the minerals of which the outer crust of the earth is formed, is consequently of the greatest utility in aiding us to compare different soils and ascertaining their composition.

The knowledge which geology imparts is however not sufficient for the minuter classification of soils; for it is found by experience that the soils which lie over or near the different strata, as they appear near the surface, vary greatly, although they retain some general character which distinguishes them from others. The streams which descend from the hills, and flow towards the valleys, and through them to the sea, carry to a great distance the minuter portions of the minerals which they flow over in their course, while the larger and heavier are deposited much sooner. Hence the heterogeneous mixture of various earths and stones, and their stratification in thin layers, as is often found when a soil is examined which has never been disturbed by cultivation. A sudden flood rising rapidly carries stones and fragments of rocks in its course, while a gentler stream deposits fine sand or clay over these, and forms every variety of sandy, gravelly, or clayey soil. If chalky hills are near, carbonate of lime abounds in almost every proportion, with its usual concomitant irregular flints. If the waters have accumulated in a basin, and formed a temporary lake, the soil will consist of all the finest portions of the minerals, which from their minute size have remained long suspended in the still waters, and slowly deposited in the form of mud. In proportion to the shallowness of the lake, vegetable matter will have been produced, and intimately mixed with the minerals; and where vegetation has gone on rapidly, peat and soft bogs are formed.

It is not sufficient to class soils according to the substance which predominates, as has been usually done, such as sandy, gravelly, chalky, or clay soils; for this gives very imperfect information respecting their nature or fertility; neither is it altogether sufficient to class them according to any particular geological formation. It is important to enter into a more minute examination of their component parts. But as the geological investigation of the different strata is a great help in the examination of soils, we will in the first place give a short description of those which have the most distinct characters, from their connection with different geological formations.

The soils which are immediately derived from those rocks in which no traces of organic remains are to be found, consist either of visible fragments of quartz and other hard minerals, which are not affected by exposure to air or water, and are only ground and comminuted by being rubbed against each other in floods and torrents, or of minuter particles of the same, of which the shape is not readily distinguished by the naked eye. When they are altogether composed of visible particles and stones, the water readily passes through them; and unless they are kept continually moist by a regular irrigation, without any stagnation of the water, they are absolutely incapable of sustaining vegetation, or of bringing fruits to maturity. It is seldom, however, that any gravel or sand does not contain some portion of earth or other matter, of which the particles become invisible when diffused through water, and to which, for the sake of perspicuity, and to prevent confusion, we will here give the general name of *impalpable substance*. A certain portion of this finer part of the soil, and its due admixture with the coarser, especially where there is some regular gradation in size, and no stones of too large dimensions to obstruct the instruments of tillage, may be considered as essential to fertility. The chemical composition of the impalpable substance no doubt greatly affects the degree of fertility; but the general texture must be considered as by far the most important circumstance. To improve this texture permanently is the great object of all the labours of the husbandman. For this purpose he carries various earths from one spot to another; clays one field, and limes or chalks another; brings peat upon sands and clays, and carries gravel and lime on his peat-bogs. Without an adequate knowledge of the composition and texture of a soil, it is impossible to make permanent improvements with any certainty, or without incurring the risk of failure or of useless outlay.

The soils which have been formed from the disintegration and decomposition of the primitive rocks, such as granite, basalt, schist, or limestone, and especially those which contain all these minerals minutely divided and intimately mixed, are always naturally fertile, and soon enriched by cultivation. The hard particles of quartz maintain a certain porosity in the soil, which allows air and moisture to circulate, while the alumina prevents its too rapid evaporation or filtration. The silicate of potash also seems highly favourable to the vegetation and growth of those plants which contain silica in their stems, such as the gramineæ, especially wheat, of all plants the most important to the husbandman in our northern climates. If organic matter be an essential ingredient in a fertile soil, it is soon produced by cultivation, or added by judicious manuring.

Where there is a deficiency of impalpable matter, and the fragments of the rocks of which the soil is composed are large, and lie loosely, it is in vain to expect vegetation except along gently flowing streams, which supply the roots with moisture, and thus form a bed of vegetable matter; but in a climate suited to the vine, and in a good exposure, these loose soils often produce excellent wine, as may be seen along the steep banks of the Rhine and other rivers. The roots of the vine run deep into the fissures of the rocks below, and there find nourishment suited to their nature.

The primitive limestone, which is very hard, is yet gradually decomposed by the action of air and water, being, in a very small degree, soluble in the latter. The water which flows through these rocks is soon saturated; but when it springs out and comes to the light, the carbonate of lime is deposited by the evaporation of the water; and if this meets with the clay which results from the decomposition of the slate, it forms a marl, which, naturally or artificially added to silicious sand, forms the basis of a very good soil, particularly well adapted to pasture.

The soils which have been evidently formed from the rocks which are supposed to be of secondary formation, are fertile according to the proportion of the earths of these rocks which they contain. It is of these chiefly that those loose sandy soils are formed of which the particles appear as distinct crystals, easily distinguishable with the aid of a lens, or even by the naked eye. Air and water have been the chief agents in the decomposition of those secondary rocks called *sandstones*, and agitation in water has washed from them the finer portions, which have remained suspended. The immense sandy plains which are either barren or have been fertilized with great trouble and expense, have probably once been the shores of the sea, from which the waves have washed all that portion which was impalpable and easily suspended in water, depositing this in the depths, which, by some convulsion of nature, may some time or other be raised above the level of the waters, and form hills or plains of clay, such as are often found in extensive basins of great depth.

Argillaceous earth exists in some proportion in almost every rock. Some of the hardest gems are chiefly composed of alumina. It has the property, when mixed with other substances, as silica or lime, of fusing into a stone of great hardness and friability. In this state its effect on the soil is not to be distinguished from that of silica; and by burning common clay, or clay mixed with carbonate of lime, a sandy substance is produced resembling burnt brick, which tends greatly to improve the texture of those clays which contain little or no sand in their composition. It must be remembered that the stiffest clays contain a large portion of silica in an impalpable state; but this, instead of correcting their impermeable and plastic nature, rather adds to it. It is only palpable sand which with clay forms what is commonly called loam, and which, when the sand is in due proportion with a mixture of organic matter, forms the richest and most easily cultivated soils. Some of the rocks of secondary formation contain a considerable portion of alumina and lime; and when these earths meet with crystallized sand, a compound, or rather a mixture is formed, which has all the requisite qualities, as to texture, to produce the most fertile loams. The only deficiency is that of organic matter; but this is so readily accumulated wherever vegetation is established, or can be so easily added artificially, that these loams may always be looked upon as the most favourable soils for the usual agricultural operations; and if a considerable depth of loam is found, which neither retains water too long, nor allows it to percolate too rapidly, it may be looked upon as a soil eminently capable of the highest degree of cultivation, and on which no judicious outlay of labour will ever cause loss or disappointment to the farmer.

The greensand which lies under the chalk, and appears near the surface in several parts of Britain, consists of siliceous, argillaceous, and calcareous earth, intimately combined and in a high state of subdivision, and yet not forming a compact paste with water so as to dry in hard lumps, but having rather the loose appearance and granulation of fine sand, whence its name. On this soil are found the finest wheats; but such is the variety of its form as it approaches towards the chalk or crystallized sand, or the plastic clay, that the soils which it forms have every degree of texture, from loose sands to stiff marls, whose chief use is to mix with other soils and improve them. In general however it may be said that the soils of which the greensand forms a considerable part are productive and easily cultivated, and that they repay the labour and manure expended on them better than most others. A narrow strip of this sand crosses Bedfordshire, and in the neighbourhood of Sandy and Biggleswade are raised some of the finest culinary vegetables which come to the London market. This sand, though light in appearance, and very easily worked, contains much of the impalpable substance mentioned before; and this, with careful cultivation and manuring, makes it peculiarly suited for gardens as well as for corn-fields. In its natural state it is easily distinguished from other sands by certain dark particles in it, which give it the greenish hue from whence it has been called greensand, and also by its effervescence with strong vinegar or any other acid.

Chalk is perhaps the mineral most widely spread throughout Britain. The chalk formation of itself forms a very poor and barren soil. In the course of ages the surface of the chalk has been covered with a thin coating of soil, consisting of chalk and organic matter chiefly. On this soil the finest and most aromatic plants are found, but of minute dimensions, affording a sweet short pasture, much relished by sheep. The constant treading in of the dung of the sheep, and the stimulating effect of their urine, gradually increase the quantity of vegetable and animal matter; and thus the turf becomes close and rich: but if this thin coat be disturbed by the plough and mixed with the chalk below, it will, after one or two tolerable crops of corn, be reduced to its original sterility; and it requires ages to restore the fine pasture which once covered it. Such is the case with those hills which are called the South Down Hills, in Sussex and Wiltshire, on which are bred the excellent sheep which bear that name.

But the chalk has in many places been carried down by the rains and transported in a comminuted state to the sandy or clayey valleys around them, and by the mixture has greatly improved both, forming various loams and marls in themselves highly fertile, or very useful in increasing the fertility and texture of other soils. Chalk has the peculiar property of neutralizing acids of every description, and of preventing their formation in the soil by the fermentation of vegetable substances; while it assists in that slow decomposition which causes the evolution of carbonic acid, and thereby fosters and invigorates vegetation. The presence of carbonate of lime, if it does not exceed a third part, and if it is intimately blended with alumina and silica, is always a sign of fertility, especially when loose sand is mixed with it, so as to form one-half of the whole soil. This is called a light calcareous loam; and is usually found on the slopes or around the base of chalky hills.

The Weald clay consists of very minute particles of alumina and silica, forming a tough unctuous earth, fit for the growth of oaks, with very few stones or visible particles. This soil is found in Sussex and Kent chiefly. The plough cuts it into continuous slices, when it can be ploughed, which is only in a certain state of moisture; for when it is dry, the surface is as hard as a rock, while the subsoil is continually moist, the water being unable to pass through its pores. It has the most unpromising aspect, drying into hard lumps like brick, and apparently incapable of being brought to such a state of mellowness as to admit the seed or cause it to vegetate; yet this stubborn soil may be rendered fertile by tillage, draining, and exposure to frost in winter; and its tenacity may be corrected by the application of lime, ashes, and other substances, especially fresh stable-litter, which interpose and prevent the clods from re-uniting into one tough impervious mass. Lime and chalk do this most effectually; and when the weald clay has been brought to a looser texture, it produces beans, wheat, oats, and clover in great perfection.

The system of complete under-draining by parallel drains, at the distance of from 10 to 20 feet, which carries the moisture into the surrounding ditches, has in many instances so greatly improved the weald clays, that those who had formerly attempted to cultivate them can scarcely believe their eyes when they see the abundant crops produced. Subsoil ploughing has also done wonders after complete draining, in some cases rendering the soil so mellow and loose as to allow of the cultivation of turnips, especially the Swedish. As clay soils predominate in England, and their improvement has been almost despaired of, it is of great importance that it should be generally known, that no soils repay the cost of improvement better than clays, provided the surface be such as to admit of perfect draining.

Another clay is called the Oxford clay. This is of a bluish colour, which alters on exposure to the air, probably from a change in the oxidation of the iron which it contains. This clay is favourable to the growth of grass, and some of the richest pastures in Wiltshire and Oxfordshire have it for a subsoil, over which the decomposition of the roots and leaves of the grasses has formed a layer of vegetable mould of the highest degree of fertility. In the fens of Lincolnshire the Oxford clay is covered by a coat of peat, formed by the decomposition of aquatic plants, which have accumulated wherever the water had no natural exit. When these fens were laid dry by an extensive system of draining, the peat was converted into a rich soil by the admixture of the clay which was found under it.

The *Oolite* formation contains much carbonate of lime cemented by an unctuous earth into a species of stone. The soil which lies over this stone, and which is of nearly the same nature, but broken and disunited, is various in its qualities. Sometimes it is of great fertility, and sometimes nearly barren, according as the impalpable matter in it abounds and contains a due proportion of the different earths, or it resembles a loose chalky sand, in which moisture is retained with difficulty. In the first case it produces every kind of grain in abundance with moderate cultivation. In the latter it requires a great outlay of manure which readily disappears, and it is justly called a poor hungry soil.

On the red-sandstone is found a soil which is usually of the finest quality. The fine loose soils of Devonshire and Somersetshire are of this description. It unites most of the requisites of a good soil in its texture, neither too close nor too loose, and in the impalpable matter in its composition. It is peculiarly adapted to the growth of potatoes and all roots which form the basis of a judicious cultivation. When it contains a proper portion of calcareous earth, it may be reckoned amongst the most fertile soils, and where this is deficient, the addition of lime or chalk is the best means of improving it. The calcareous earth seems greatly to add to the effect of the usual manures, so that a much smaller portion is required to produce good crops.

The neighbourhood of coal, however valuable it may be to the proprietor of the land in a mercantile point of view, is generally accompanied by a great degree of poverty in the soil wherever this mineral crops out to the light. Coal seems not only barren in itself, but almost incapable of being fertilised. The slate which usually accompanies it crumbles into a very poor earth, which lets the water through, and is composed of visible fragments of irregular shapes. The same may be said of the slate which rises into high hills in Devonshire and Cornwall. The strata here are generally very upright and narrow, and the water finding an easy exit downwards between them, leaves the surface too dry to favour vegetation, even if the soil which covers it were more fertile; but every portion of organic matter is carried off, and none can accumulate to form vegetable mould. The lands which are in cultivation in the valleys whither the waters have carried a mixture of earths, and where the subsoil is of slate, require much manure to produce even moderate crops.

These are some of the principal natural soils found in Great Britain. It will be seen that each distinct formation gives rise to a great variety with respect to fertility, even where the basis remains the same: but it is of great importance to the farmer to ascertain the general nature of the rocks and strata on which his farm is incumbent, and no chemical analysis can determine the exact value of the land, unless the geological situation of it is distinctly known. But with this guide the analysis may distinguish the varieties, and point out the spots which can be cultivated at the least expense, or improved by the simplest means, while it may also show the deficiencies which render a soil on the most favourable formations difficult of cultivation or improvement, when these deficiencies are not easily remedied for want of those substances which are not found within reach of the farm. In all these soils no notice has been taken of organic matter, because this seems not in any great degree to be connected with their formation. The primary strata are distinguished by having no traces of organic remains in their composition. The secondary have not a sufficient proportion to call for an especial notice of it. It is in the tertiary strata, especially those which have been formed by the destruction of animal and vegetable substances, that organic matter becomes a peculiar object of attention, and from this reason alone the alluvial soils of later date are found highly fertile, whenever the circumstances which prevented their cultivation are removed; whether it be the waters which are to be shut out by dykes or carried off by draining, or a want of labourers which has left them to a state of nature, whenever the soil is turned up and the seed sown, the crops are always, for a greater or less period, certain and abundant.

The alluvial soils formed by the deposit of a variety of earths in a state of great division, and mixed with a considerable portion of organic matter, form by far the most productive lands. They will bear crop after crop with little or no addition of manure, and with a very slight cultivation. These soils are found along the course of rivers which traverse extensive plains, and which have such a current as to keep very fine earth suspended by a gentle but constant agitation, but not sufficiently rapid to carry along with it coarse gravel or sand. Wherever there is an obstruction to the current and an eddy is formed, there the soil is deposited in the form of mud, and gradually accumulating, forms those alluvial soils which are so remarkable for their fertility when carefully protected from the inroads of the waters. In these soils the impalpable matter greatly predominates; but the intimate mixture of the earths with organic matter, in that state in which it has been called *humus*, prevents their consolidating into a stiff clay; and the gasses which are continually evolved from the organic matter keep the pores open, and give scope to the growth as well as the nourishment of the roots. It is in the alluvial soils principally that an accurate analysis is useful; because the proportion of their constituent parts varies in innumerable degrees. It may be laid down as a general rule, that the most fertile of these soils are those in which the primitive earths are nearly in equal proportions, silica being the most abundant, with about 10 per cent. of organic matter: a greater proportion of this last would form too loose and spongy a soil to bear good crops of corn, especially of wheat. But 4 per cent. of humus, with a good mixture of earths, and some phosphate of lime from the decomposition of bones and marine shells, produces a very good wheat soil. The rich warp-lands along the Humber are artificial alluvial soils, and although they contain but a small proportion of humus, are highly fertile after their first deposition, but it is observed that they gradually become more tenacious and difficult of cultivation as this humus is carried off by the crops; and that it is soon necessary to add animal and vegetable manures to supply its deficiency.

Organic matter is no doubt essential to great fertility in a soil, but some soils require more of it than others. *Humus*, which is the form which organic matter naturally comes to by slow decomposition in the earth, gives out certain elements which the roots can take up in their nascent state, and from which they obtain the carbon which is so abundant in all vegetable productions. But organic matter in every stage of its spontaneous decomposition keeps the pores of the soil open, and admits, if it does not even attract, air and moisture to the fibres of the roots. In all rich soils which have been long cultivated, especially in gardens, there are particles of a dark colour and fibrous texture, which in the microscope appear like minute logs of charred wood. These keep the soil open, and supply carbonic acid, when the air reaches them, or they are slowly transformed into humus, which remains inert as long as it cannot imbibe oxygen and form carbonic acid by a species of slow combustion. Humus is no doubt one of the chief causes of fertility, but its presence does not appear to be so indispensable as has been imagined. A proper texture seems a much more indispensable condition. Humus can undoubtedly be formed from the elements of water and of the atmosphere. Whether it be directly or by the slow process of vegetation and subsequent decomposition, does not so readily appear, but it is certain that there are soils which are highly fertile in which scarcely a trace of humus can be discovered, and which, from their igneous formation, cannot well contain organic matter; such are the soils which are produced by the decomposition of the lava which has run in a liquid state from the craters of volcanoes. This is composed of different minerals, which have been fused by the action of heat, but in which the mixture of the earths and salts has not been in such proportions as to form a perfect glass. When exposed for a time to the influence of the atmosphere, the lava crumbles into an earth which is neither so loose as silicious sand nor so plastic as clay, and which has such a porosity as suits the growth of the roots of vegetables. By the effect of a warm climate and frequent rains, vegetation goes on rapidly; and by cultivation humus is soon formed and accumulated, so that it is only in the more recently cultivated lavas that it can be said that vegetation goes on without any supply of organic matter; and the addition of humus greatly increases the fertility of these soils. It is much easier to supply the deficiency of humus, which at best forms but a very small portion of the soil, than of silica or alumina, which should enter into its composition in the proportion of one-half or a third of the whole. It is practicable to carry lime or chalk upon soils which do not contain calcareous matter; clay may also be carried upon loose sandy soils, where it can be found below the surface, or at a moderate distance; but if a soil is very deficient in silica, it requires so large a proportion of this earth to give porosity to stiff clay, that it very seldom can repay the trouble and expense. Hence the difficulty of bringing poor wet clay soils into a fertile state, except where an abundance of chalk and vegetable manures can be easily procured. In this case the perfect draining of the land, and exposure of the ploughed surface to the frosts of winter, with the addition of chalk and manure, produces such an alteration in the texture of the clay, that by continuing the improving process it is entirely changed into a mellow and fertile loam. The burning of a portion of the retentive subsoil into a brick-like earth gives it a porosity which renders it mechanically similar to silicious sand, and converting the iron which all these clays contain into a peroxide, the soil is thereby greatly improved in fertility; for it seems that iron, in a state of slight oxidation, or combined with any acid, is hurtful to vegetation, whereas the red peroxide is not only innocuous, but seems to have fertilising properties.

The comparison of the different fertile soils leads therefore to the conclusion that the texture or porosity arising from the admixture of particles of various dimensions is the most important object of examination; and subordinate to this is the chemical constitution of the earths and other substances of which it is composed. In the examination and analysis of soils for the purpose of ascertaining their power of production, we must therefore first examine them mechanically, and afterwards chemically, and on this principle has been proposed the mode of *analysing soils*, in a paper which obtained one of the first prizes given by the Royal English Agricultural Society, and published in the first number of its journal. We will here insert a short account of the process, with such alterations and additions as more extensive practice has suggested.

There are two easy methods of ascertaining the size of the particles of a soil. The first and simplest is by drying the portion under examination, gently triturating it with a wooden pestle in a mortar, so as not to produce a grinding of the more solid portions, and then separating the coarser from the finer parts by means of several metallic sieves of different fineness. A simple instrument is recommended for this purpose, which is very portable, and consists of three or four sieves fitting into each other like the percolators in a *coffee-biggin*; the coarsest sieve being uppermost and covered with a lid; the finest fitting into a recipient, and the whole forming a cylinder three or four inches in diameter, and from six to eight in height. The coarsest sieve has threads at the distance of $\frac{1}{20}$ of an inch, the second has 50 to an inch, the third 100, and the fourth is the finest metallic tissue which can be made. What remains in the two first is easily examined by the eye, or with the help of a lens. The third and fourth require a microscope to see whether any crystallized particles remain in the impalpable dust which has gone through all the sieves. By carefully weighing these different earths their proportion is known, and by taking the specific gravity of each their nature can be guessed at with tolerable accuracy.

As this analysis is not intended for experienced chemists, the simplest methods are preferred to the more accurate. There is a mode of taking the specific gravities of substances, which are in the form of powder insoluble in water, so easy and so little liable to error, that any person, however unaccustomed to experiments, can soon become sufficiently expert to have full confidence in the result. It is as follows: A small pear-shaped phial is blown of thin glass, and the neck cut and ground smooth. The size is such as to contain 300 grains of water, more or less; the exact quantity is not essential. It is now filled with pure water at 60° of Fahrenheit's scale, and accurately poised in a delicate balance; 100 grains weight are then placed in the same scale with this phial, and, by means of a very fine tube, water is gradually sucked out of the phial, till the equilibrium is restored, that is, exactly 100 grains of water have been taken out. A counterpoise is now made of lead or brass, when the 100 grains weight has been removed, and this serves for all future experiments. When the specific gravity of any substance is required, the phial, partly filled with water, is placed in one scale, and the counterpoise, made as above described, is placed in the other; water is added or taken from the phial till an equilibrium is obtained. The substance to be tried is slowly and carefully poured into the phial, until the water rises to the ground surface of the neck and stands quite level, which is easily seen by observing the reflexion of the light from the surface. It is then carefully replaced in the scale, and grain weights are added to the other scale to restore the equilibrium. The number of these grains at once indicates the specific gravity of the substance; for the space above the water was that of 100 grains of water, and this space is now filled up by the earth examined. Its weight therefore denotes its specific gravity compared to water as 100; and as a common balance readily turns with a decimal of a grain, the decimals give the specific gravity to the third figure. Thus if the grains are 255 and the decimals 4, the specific gravity is commonly 2554, water being 1000.

By taking the specific gravity of the pure earths, it is found that silica is the heaviest, next carbonate of lime, and the lightest is alumina, while organic matter is much lighter than any earth. Thus a tolerable guess can be made of the composition of that impalpable portion of the soil which generally contains all the salts and organic matter. To separate these chemically requires more expertness and a more extensive apparatus; but the quantity of carbonate of lime in any soil which effervesces with acids, so that its presence is thus ascertained, can be calculated by a simple process, almost as easily as the specific gravity: for this purpose it is necessary to have a balance with a somewhat larger scale, in which can be conveniently placed a small glass cup and a phial. The cup is placed in the scale, with 100 grains weight in it; and the phial, also containing 200 to 300 grains, more or less, of very dilute muriatic acid. The whole is accurately poised. Fine dry sand is the most convenient counterpoise, when the exact weight is not required. The 100 grains are now taken out, and replaced by the dried soil to be examined; when the equilibrium is restored, the diluted muriatic acid is poured carefully and gently on the earth in the cup, as long as it continues to effervesce. It is then left for a while, and a little more of the acid added. If no bubbles appear, then all the carbonic acid has been expelled, and the opposite scale preponderates. The grains and decimals of grains required to restore the equilibrium give the weight of the carbonic acid expelled, which will sometimes be considerable. Since 100 grains of carbonate of lime contain 44 grains of carbonic acid, we have only to take the proportion as follows: let *a* denote the grains of carbonic acid indicated in the experiment; then, $44 : 100 :: a : \frac{100a}{44}$ = the quantity of carbonate of lime in the soil. That is, multiply the grains added to the scale by 100, and divide by 44. This experiment repeated with a very accurate balance will surprise by its correctness; and no chemical analysis could give it with equal certainty, especially in the hands of an inexperienced person. When the weights are ascertained by substitution, the accuracy of the balance is of less consequence; all that is required is that it be sensitive, or turn readily by the addition of very minute weights. Thus, by two simple and easy experiments, some of the most important qualities of the impalpable portions of a soil may be accurately ascertained, viz. its specific gravity, and the quantity of carbonate of lime which it contains.*

It is more difficult to separate the fine silica from the alumina, and this is of less importance than might be supposed; for silica, when extremely divided, so as to remain long suspended in water, and mixed with alumina, becomes as impervious to water as alumina itself, and therefore its mechanical effect on the soil is the same. Phosphate of lime, where it is found, is no doubt of importance; but this requires a much greater knowledge of chemistry to separate it than is presumed in practical farmers, for whom this is chiefly written. Gypsum likewise has a considerable effect; but these substances are not generally diffused, and may always be suspected when the rocks and minerals in the neighbourhood indicate their presence; in which case it is prudent to submit the soil to a strict chemical analysis.

It is however very important to know how much organic matter exists in a soil, especially in alluvial soils. The specific gravity of the impalpable portions will often give some idea of this, when organic matter abounds, as in peaty soils. But the only sure test is its destruction by fire. This must be done very carefully. The soil must be dried and heated over a lamp to about 300° of Fahrenheit, stirring it often. This will expel the water, but not burn the organic matter or humus. It is then weighed in an open platinum capsule, and heated very gradually over the lamp, or in a clear fire, continually stirring it with a glass rod till it appears red; very minute portions of pure nitrate of ammonia may be added from time to time, taking care that there be no decrepitation, so as to throw any of the earth out of the capsule. After it is supposed that all the organic matter is destroyed, and expelled in the form of vapour or gas, the capsule is accurately weighed, and the loss indicates the quantity of organic matter in the soil. It will require some correction; for if alumina abounds, it will have retained some water, even after the first heating, which a red heat will have expelled. But this is not of very great importance in a mere comparison of different soils, for the same circumstances will be common to all.

The coarser portions of the soil, which have been separated in the sifting, are easily examined by the eye. If repeated washing carries off nothing from them, they may be considered as so many crystals, which have no other effect in the soil than to keep it open. If some of these are of a calcareous nature, they will dissolve with effervescence in muriatic acid, and their proportion can be ascertained by the process above described; if not, they may be all considered as mere silicious sand or gravel.

---

* A very neat instrument has been invented by Dr. Ure to facilitate this operation. It consists of a glass tube with two bulbs, which communicate by a very small aperture, and both retain a little above the level of the water. The whole may be suspended from the arm of a balance. The diluted muriatic acid is poured into the lower bulb, and the earth into the other. By inclining the instrument the acid is gradually made to pass into the bulb containing the earth. Thus the carbonic acid is expelled without danger of loss by ebullition, and the loss of weight is accurately ascertained.

A good soil is composed of one-third coarse sand, one-third very fine sand, and one-third impalpable matter, in which there is silica in the greatest quantity, alumina and lime in a smaller, and from four to ten per cent. of organic matter, without any appearance of tannin, which is readily discovered by pouring into the water which has filtered through it a weak solution of sulphate of iron; if a blackness appears, the gallic acid is present, and in proportion to its quantity the soil is less fertile. In this case quicklime is the best corrective.

In ascertaining the value of a soil for the purposes of agriculture, two circumstances should be carefully noticed. The first is the permeability of the soil to water; and the second is its power of absorbing moisture from the atmosphere. To ascertain the first, it is only required to place an equal weight of different soils in glass tubes of equal diameter, pressing them so that they shall occupy equal spaces, but not filling the tubes. Then pour an equal quantity of water over each soil, and place them upright with cups under them. Examine which has the surface first dry, and how much water runs through each in a given time. That which presents a dry surface, while it holds most water in its pores, is probably the best. To ascertain the comparative absorption of moisture, the soils are dried in pairs on a plate of metal heated by steam, or at a heat of 212°, to expel the water. They are then placed in equal quantities in similar flat cups or dishes, and placed in opposite scales of a balance, and poised. The apparatus is exposed to a moist atmosphere out of doors, or in a cellar, and occasionally examined. That which is heaviest is, in general, the most fertile, and contains most humus. If there are more than two soils, they are compared with each other, and with a third as a standard.

By these simple means any person, however ignorant of chemistry, or unaccustomed to make accurate experiments, may soon satisfy himself as to the comparative value of different soils which have never yet been cultivated; how they may be improved, and what crops are best suited to them;—things of the greatest importance to those who go to distant colonies in the hopes of obtaining good land at a moderate price, and cultivating it to advantage.

But we have intimated that there were other means of ascertaining the mechanical texture of soils than by sifting them. This is by washing with pure water. For this purpose nothing is required but a few flat plates and large cups. Some of the soil is formed into a very thin mud by stirring it in a cup nearly full of water. The finer particles are successively poured off from the sand or grit, which at last remains pure, so that the water added to it is no longer discoloured. This being dried and weighed, gives the coarse sand. The water and earth poured off are allowed to settle. A common soup-plate is found a very convenient vessel for this purpose. On the surface of the deposited earth will be found all the undecomposed vegetable matter, which with a little care is easily taken off, dried, and weighed. The finer portions of the earth can be poured off successively, by shaking the whole moderately, till nothing but very fine sand remains. The alumina and impalpable silica will remain long suspended in the water, and allow any sand yet remaining to be deposited. They may be rapidly separated from the water by filtration through stout blotting-paper; but it is preferable to pour them into a glass tube about one inch in internal diameter, with a cork fitted into the lower end. In this tube the earths slowly fall to the bottom, and any variety in the size of the particles causes a line more or less distinct, which can be observed through the glass; and thus a very good idea may be obtained of the porportion of the different earths, as far as regards the size of their particles. For their chemical differences, the preceding process must be adopted.

It is often useful to ascertain nearly the composition of a soil, without having time or opportunity to make accurate experiments. A graduated glass tube, which can be carried in the pocket, and a small phial with a ground stopper, containing diluted muriatic acid, and secured in a wooden case for fear of accident, is all the apparatus required. A little of the soil is taken and moistened with water; a few drops of the acid are poured on; and by the greater or less disengagement of bubbles the proportion of calcareous matter is guessed at, and its presence proved. The soil mixed with water is poured into the glass tube and well shaken. In a few minutes the coarse sand is deposited: shortly after the finer sand, and, lastly, the clay and impalpable matter, of which the lightest remains longest suspended. Distinct rings can be observed in the deposits, and the graduated tube shows their proportion. A person accustomed to this method will guess with great precision the general qualities of the soil; and when the geological structure of the neighbourhood and the nature of the subsoil are taken into consideration, the value of the land for pasture or cultivation is guessed with little danger of making very glaring mistakes. To surveyors and valuers this method is of very great help, when other means are not at hand.

In practice, soils are usually divided into light, mellow, and stiff; but this gives very little information, there being every imaginable variety in each of these. In the article **Arable Land**, we have given a more particular classification from Thaer, but this is found chiefly applicable to alluvial soils. There are still minute circumstances which produce great fertility or the reverse, and which it is difficult to investigate. An accurate chemical analysis, joined to a careful mechanical examination, and very correct accounts of the average produce under different systems of cultivation, can alone give us a scale according to which the natural fertility of different soils can be classed; and this must be the work of time and industry joined to science and practical knowledge. We shall therefore conclude this article by recommending to every lover of agriculture to observe and note the peculiarities of the soils with which he is best acquainted; to analyze them frequently and under various circumstances, and thus endeavour to find to what peculiar substance or condition is to be ascribed a greater or less degree of fertility; so as to lead to the simplest and easiest mode of rendering indifferent soils fertile, and increasing the productive power even of the best.

SOILING is the name given in agriculture to the mode of feeding horses and cattle in the stable or yards with food brought to them as it is cut in the meadows or fields. The great advantage of soiling cattle is the increase of manure of the best quality, which is thereby produced; and this circumstance alone can counterbalance the great trouble and expense incurred in cutting and carrying all the green food from a distance to the farmyard.

The system of soiling is not very generally adopted in British husbandry, it being so much easier to allow the cattle to crop their food in the pastures; but in those countries where property in land is greatly subdivided, and where farms are small and good pastures scarce, as in Flanders, France, and Switzerland, especially where the vineyards render manure scarce and dear by taking a considerable portion of it and returning none, there the soiling of cattle is almost a matter of necessity. A cow or ox requires from two to three acres of pasture or meadow to feed it all the year round, allowing a portion for hay. But by raising clover, lucern, sainfoin, tares, and other green crops, three cows or more can be fed with the produce of one acre, especially if a portion is in turnips or other succulent roots. Thus the straw of the white crops is converted into excellent manure, and the land kept in a state of fertility.

In proportion as a farm is larger in extent, so the expense of soiling increases, both from the distance of the fields where the green crops grow, and from the same distance to which the dung is to be carted. There is a limit therefore to the soiling system, unless there be many yards or stables in different parts of a farm, so as to subdivide it, and make each yard the centre of a distinct system of soiling, with fields near at hand for the green crops. In almost every experiment on a large scale it has been found that soiling was only a certain mode of purchasing dung, and that it often was more expensive to procure it in this way than to send to a considerable distance to purchase it in towns. Where it cannot be purchased at all, there are no other means, in many situations, of producing a sufficient quantity; and the trouble and expense of soiling must be submitted to. In almost every case where sheep can be folded to feed off the crops, the soiling of cattle is a loss, because the sheep pay something for their food; the cattle in the stall seldom do.

But there are animals which must be fed for the work of the farm, such as horses or oxen; and these are much more profitably and economically fed by soiling than by any other means. A horse or ox, if he works eight or ten hours, has no time for rest if he has to crop his food from a short [illegible], however sweet; whereas an abundant supply of green [illegible] or tares enables him to take a hearty meal and lie down to rest. He wants no corn with this food, and does his work without losing flesh or activity.

There is nothing easier in a mild climate, and especially a moist one, like Britain or Ireland, than to have a succession of green food from the beginning of spring to the end of autumn. Rye and winter barley, sown early in autumn, will be ready to cut as soon as the mild weather of spring commences; some sown later with winter tares and the young clover, which has not been cropped in autumn, will succeed. After this some artificial grasses, as Italian rye-grass and the grass of water-meadows mown early; although this last is not so heartly food for working cattle; but when joined to a mixture of oats and pea straw, their watery nature is corrected. Clover and spring tares (when these last are sown at proper intervals), lucern and sainfoin (if the soil is suited to them), will afford a constant and abundant supply to the cattle which eats the daily allowance. It is prudent to provide against failure, and have more land in these crops than is absolutely necessary, because the surplus can always be made into hay or reserved to ripen its seed; and these green crops, valuable as they are, far from deteriorating the soil, clear it of weeds, and render it more fit to bear corn afterwards. In this case soiling is profitable and economical.

It is generally thought in those countries where the soiling system is most universally adopted, that it is best to allow the green food to remain twelve or twenty-four hours after it is cut, before it is given to cattle. This may be prudent with cows and oxen, which are apt to eat voraciously, and are subject to be hoven from the fermentation of the green food in the paunch or rumen; but for horses there is little danger; and, if the food is not wet with dew or rain, the fresher it is eaten, the better it will nourish the animal, and the more he will relish it.

If any one is desirous of calculating the expense of soiling any number of beasts, he has only to reckon what time of men and horses it will take to cut the food and carry it to the cattle, from the average distance of the fields in which it can be raised in succession. Much of their time is lost in the morning and evening in going backwards and forwards from the field to the yard; for there can scarcely be an establishment so large as to keep them employed a whole day; and if there was, the fields must be so large and so distant, as to greatly increase the expense of carriage. Not to enter into minute calculations, it is fully proved, that, to a certain extent, soiling is profitable and economical, when it can be done before and after the usual hours of labour; but that when undertaken on a large scale in any one locality, it is usually attended with loss, the manure produced being purchased at too great a price.

If a labourer who has an allotment of half an acre of good light land would devote it entirely to raise food for a cow, his wife and children cutting the food and tending the cow in a small yard with a shed, or in an airy cow-stall, he would find that he had a much greater clear profit, than if he had sown his land every year with wheat, and had always a good crop, which last supposition is impossible. There could be no better stimulus to industry than to let a piece of land for this purpose to every man who could purchase a cow and feed it by soiling.

SOISSONS, a town in France, capital of an arrondissement in the department of Aisne, 62 miles north-east of Paris, on the road to Namur, Liege, and Aix-la-Chapelle. This town existed in the time of the Romans, by whom it was called Augusta, with the distinctive epithet 'Suessionum,' from its being the capital of the Suessiones (Σουεσσίωνες, or Σουεσσίωνες, Strabo), or, as Ptolemy writes the name, Οὐέσσονες. From this people, who were of the Belgic race, it afterwards took the name of Suessiones, or Suessiona, from whence is derived the modern Soissons. D'Anville, Dulaure, and others are disposed to identify Augusta Suessionum with the Noviodunum of Cæsar (*De Bell. Gall.*, lib. ii., c. 12), but we think this position not consistent with Cæsar's narrative. In the 'Notitia Imperii,' it is recorded that there was at Augusta a government manufactory of shields, balistæ, and armour for the cavalry called Clibanarii or Cataphracti (*fabrica scutaria, balistaria, et clibanaria*). The Roman roads popularly called *Les Chaussées de Brunehaut* are near this town, which in the later period of the Roman domination was one of the most important places in the north of Gaul, and one of the last which remained under the government of the emperors. It was the seat of government of Ægidius and his son Syagrius, and near it the latter was defeated by Clovis.

Under the early Frankish princes, Soissons continued to be of importance, and was the seat of a bishopric. Here Clovis espoused Clotilde; and upon the division of his dominions among his descendants, it gave name to one of the kingdoms formed out of them. Here, A.D. 752, Childéric III., the last Merovingian king was deposed, and Pepin le Bref, the first Carlovingian, proclaimed and consecrated. In A.D. 923 Charles le Simple was defeated at Soissons by the troops of Robert, his competitor, who fell in the battle. Under the kings of the third race (the Capetian) Soissons was the capital of a county, and received from Louis VI. (le Gros), with the consent of the count, a municipal charter; but the burgesses, weary of the contentions which they had with their counts and with the canons of the cathedral, surrendered their charter to the king Charles IV. (le Bel), A.D. 1325. Philippe VI. (de Valois) granted them some privileges, but would not re-establish the municipality. The county had in the meantime come by marriage to the Count of Hainault and Holland; it was subsequently divided, part soon falling to the crown, the other part, with the title, passing to a branch first of the house of Bourbon, and then of the house of Savoy; the last holder of this portion was the father of the well known Prince Eugene. [EUGÈNE FRANÇOIS DE SAVOIE.] In A.D. 1413 the town, then garrisoned by the Bourguignon party, was taken by the rival faction of the Armagnacs, who committed the most dreadful excesses. Having again fallen into the hands of the Bourguignons, it was a second time taken and pillaged by the Armagnacs. In A.D. 1544 the emperor Charles V. in his invasion of France was at Soissons. In the religious wars of the sixteenth century and in the troubles of the minority of Louis XIII. it suffered again. In the campaign of 1814 it was twice taken by the allies and retaken by the French; it was a third time besieged by the allies, bombarded, and much damaged.

The town stands on the south bank of the Aisne, over which river is a handsome stone bridge, uniting the town to the suburb of St. Vaast on the northern side. The town and the suburb of St. Vaast are fortified; the circuit of the walls includes many gardens and void spaces. The other suburbs are without the walls. The streets, though not wide, are for the most part well laid out and neatly kept: the houses, which are commonly of one story, are built of stone, and many of them covered with slate. The cathedral is a large and fine Gothic church, with a tower 160 feet high. Of the church of the ex-abbey of St. Jean des Vignes, the west front, with two noble towers, and spires remains, and is of rich Gothic architecture. The church of St. Pierre is of Lombard architecture; that of St. Leger belongs to the period of the revival of the arts. There are an antient castle and some remains of the antient abbey of St. Médard, in which Louis le Debonnaire was imprisoned by his rebellious children. The ex office of the intendant (*i.e.* the director of the finances and judicial administration) of the Generality or province of Soissons, is one of the finest buildings in the town. There are public walks, a theatre, and public baths.

The population of the commune of Soissons, in 1826, was 7483; in 1831, 8142 (7946 of them in the town); and in 1836, 8124. The townsmen have few manufactures; some fine carpets, woollens, hosiery, linen, twine, seed oil, leather, and percussion caps for guns are however made. Considerable trade is carried on in corn, flour, and pulse (especially French beans), for the supply of Paris, and timber and firewood, which are sent down the Aisne to the capital. There are a considerable weekly market and fourteen yearly fairs. Soissons has a college, two seminaries for the priesthood, a society of sciences, arts and belles-lettres, a public library, a drawing-school, an hospital, a foundling-hospital, a tribunal of commerce, a subordinate court of justice, and two prisons. The revolutionists Collot d'Herbois and Rousin were natives of Soissons.

The arrondissement of Soissons had, in 1831, a population of 68,035; it comprehended six cantons or districts, each under a justice of the peace, and 169 communes. The diocese comprehends the department; the bishop is a suffragan of the archbishop of Reims.

SOJA HISPIDA (Mœnch), Soja Japonica (Savi), the Dolichos Soja (Linn.), a leguminous plant, native of Japan and the Moluccas, and abundant in the peninsula of India, though probably introduced there. The seeds resemble those of the haricot, French or kidney bean, and are used by the Chinese to 'form a favourite dish, called *teu-hu*, or *tau-hu*, which looks like curd, and which, though insipid in itself, yet with proper seasoning is agreeable and wholesome.' (Don's *Dictionary*.) The Japanese call the seeds *Miso*, and put them into soup, of which they sometimes partake three times a day. They likewise prepare with them the sauce termed *Sooja*, which has been corrupted into *Soy*. 'The beans are boiled until all the water is nearly evaporated, and they begin to burn, when they are taken from the fire, and placed in large wide-mouthed jars, exposed to the sun and air; water and a certain proportion of molasses or very brown sugar are added. These jars are stirred well every day, until the liquor and beans are completely mixed and fermented; the material is then strained, salted, and boiled, and skimmed until clarified, and will after this process become of a very deep brown colour, and keep any length of time. It has been stated that the gravy or juice of meat was used in preparing this condiment, but it appears to be entirely made from vegetable materials. There are two or three qualities of soy. To make the best requires much care and attention. Japanese soy is much esteemed in China on account of the superior manner in which it is made. Shopkeepers at Canton who sell soy have large platforms on the roofs of their houses, where the jars for preparing soy are arranged and exposed to the sun; for the consumption of soy is enormous. Neither rich nor poor can breakfast, dine, or sup without it; it is the sauce for all kinds of food; gives a zest to every dish, and may be said to be indispensable at a Chinese repast.' (Dobell's *Kamschatka*.) Soy is only sparingly used as a sauce in this country. It has the character of being a useful stomachic, but not more so than any of the other condiments when used with moderation.

SOKENS. [Essex.]

SOL, in music, the name given, in sol-fa-ing, by the English, Italians, and French to the fifth of the scale; and by the two last also to the sound called G by the Germans and English. [Solmisation.]

SOLA, frequently *Shola*, is the name of a plant common in moist places, and in the rainy season in many parts of the plains of India. It belongs to the genus Æschynomene, and has been called *Æ. aspera* by Linnæus, from the lower part of the stem being rough and scabrous, as well as the legumes. It has been called *Æ. lagenaria*, both by Loureiro and Roxburgh. The plants are remarkable for their light and spongy texture, and seem indeed to be composed almost entirely of pith. On this account the thicker stemmed plants are collected in the dry months and the light substance applied to a variety of uses, as for making some kinds of toys, and the floats of fishermen's nets; cut into thin slices and pasted together, they are much employed for making hats, which, being light and having broad brims, are well suited for protecting the head from the influence of the powerful Indian sun, especially if a handkerchief be put loosely into the crown of the hat. This substance has also been employed for lining drawers of natural history, and in its texture very much resembles the substance called rice-paper, which is the pith or stem of a Malvaceous plant cut into thin slices. A branch with leaves of this latter plant has been figured in Bennet's *Wanderings in New South Wales*.

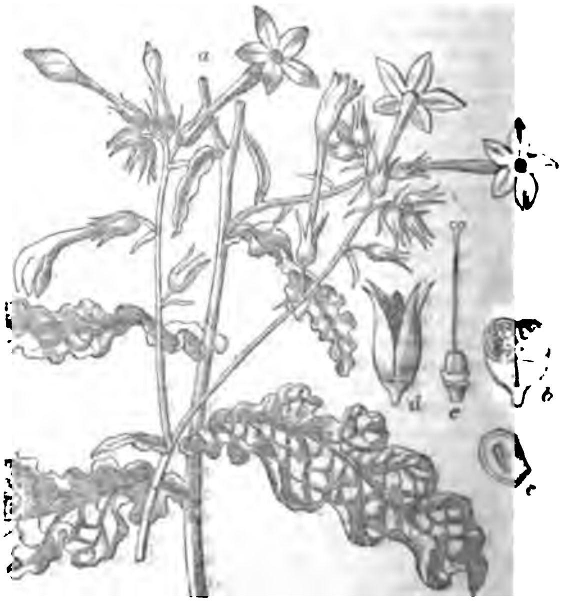
SOLAN GOOSE. [Booby, vol. v., p. 160.]

SOLANA'CEÆ, a natural order of plants belonging to the dicarpous group of monopetalous Exogens. This order is composed of herbs or shrubs, rarely of arborescent plants, with colourless juices, round or irregularly angled stems or branches, sometimes armed with thorns or prickles; their leaves alternate, simple, entire, or lobed. The inflorescence is variable, mostly axillary, sometimes terminal, pedicels without bracts, and the flowers regular and united. The calyx is 5-parted, persistent, inferior; corolla monopetalous, hypogynous, 5-cleft or 4-cleft, regular, deciduous, plaited or imbricated in æstivation; stamens inserted upon the corolla, as many as the segments of the limb, and alternate with them, anthers bursting, mostly longitudinally, sometimes by pores at the apex; ovarium 2- or 4-celled, style continuous, stigma simple; fruit either a capsule, with a double dissepiment parallel with the valves, or a berry with the placentæ adhering to the dissepiment; seeds numerous, sessile; embryo straight or curved, lying in fleshy albumen; radicle next the hilum.

This order is most closely allied to Scrophulariaceæ, but is distinguished by Brown from that order by the possession of a curved or spiral embryo, a plaited æstivation of the corolla, and the flowers being regular, with the same number of stamens as lobes. From the occurrence of many species in this order with a straight embryo, but with the other characters of Solanaceæ, Lindley, with Bartling and others, is inclined to look upon this as a secondary point, and a plaited corolla and symmetrical flowers to constitute the real character of this order. Solanaceæ and Scrophulariaceæ are however so nearly allied that scarcely any limits exist between them. They may be considered as the connecting groups of two larger masses of plants, of which one has a tendency towards regular flowers and symmetrical stamens, and the other a tendency towards irregular flowers and didynamous stamens.

The plants of this order are natives of most parts of the world, without the arctic and antarctic circles, and especially within the tropics.

This order is one of the most important and interesting in its class, from its bringing together plants of the greatest utility, yet possessing apparently opposite properties. It is a great advantage of a natural system that it brings together not only plants that are allied in structure, but in properties also; but this order seems to form an exception. The deadly nightshade, the esculent potato, the pungent capsicum, the mild tomato, the wholesome egg-plant, and the poisonous tobacco, are all found here. They will all however, on close examination, be found to possess the same properties in a greater or less degree. The potato, the tomato, and egg-plant possess, when uncooked, in a mild degree, the properties of the nightshade, the stramonium, and the henbane, confirming the remark of De Candolle, 'that all our aliments contain a small proportion of an exciting principle, which, should it occur in a much greater quantity, might become injurious, but which is necessary as a natural condiment.' In fact, when food does not contain some stimulating principle, we add it in the form of spices. Many of the plants of this order are used in medicine, amongst the most valuable of which are henbane [Hyoscyamus], deadly nightshade [Atropa], bitter-sweet [Solanum], stramonium [Datura], and tobacco [Nicotiana]. The species of *Physalis* were formerly used in medicine, but are not now in repute in this country. *P. Alkekengi*, the common winter cherry, is grown as an ornamental plant; and in Arabia, and even Germany and Spain, the berries are eaten as a dessert. *Lycium barbarum* is known in this country as *tea plant*, and has been recommended as a substitute for the Chinese plant. The calabash-trees of the West Indies and the American continent are different species of *Crescentia*, which is often referred to this order. The fleshy pulp of the fruit of some is eaten, but in most species is deleterious. The most valuable part of the calabashes is their rind, which is tough, and it is applied by the negroes to a variety of purposes. Cups, mugs, bowls, basins, and saucepans are made from them, and, in fact, almost every other article of household use. Cayenne-pepper [Capsicum] is the produce of



Nicotiana crispa.

a, cutting, showing alternate leaves and monopetalous flowers; *b*, transverse section of capsule with many-seeded placenta; *c*, pistil; *d*, fruit; *e*, seed with straight embryo surrounded with albumen.

Capsicum, as well as the potato, tomato, and egg-plant (Solanum), which are used extensively as articles of diet.

SOLANDER, DANIEL CHARLES, a celebrated naturalist, the pupil of Linnæus, and the friend of Sir Joseph Banks. He was born in Nordland, in Sweden, where his father was a minister, on the 28th of February, 1736. He studied at Upsal, under Linnæus, and took his degree of M.D. at that university. After this he made a tour in Russia, and on his return was recommended by Linnæus to go to England. For this purpose he embarked on board a vessel of war, which was suddenly ordered to the Canary Isles, taking Solander far away from his destination. He however made the most of it, for he not only shared the prizes taken by the vessel on this cruise, but made great additions to his knowledge of natural history whilst at the Canary Isles. Shortly after his arrival in England, which was in October, 1760, he was employed at the British Museum for the purpose of drawing up a catalogue of the collections in that institution. Three years afterwards he was appointed one of the assistants in the natural history department. In 1764 he was elected a fellow of the Royal Society. In 1766 he published a catalogue of the fossils presented to the British Museum by Mr. Brander. In 1768 Sir Joseph Banks proposed to Dr. Solander that he should accompany him in a voyage round the world, in search of discoveries in natural history. To this he assented, and the trustees of the British Museum having permitted a continuance of his salary in his absence, the two naturalists started with Captain Cook in his celebrated first voyage round the world. During this voyage Dr. Solander probably saved a large party from destruction, in ascending the mountains of Tierra del Fuego, by advising them on no account to give way to sleep when they arrived at the cold summit. He himself was the first affected amongst them, and was with difficulty kept awake during their perilous adventure, which was attended with the death of a negro and an English seaman, from the effects of the cold. They returned from this voyage in 1771, laden with treasures, which are still in the collection at the British Museum. It does not appear that Solander received any remuneration for his services in this expedition, unless it was from Sir Joseph Banks, whose munificence knew no bounds when forwarding in any manner the study of natural history.

Sir Joseph Banks and Solander wished to accompany Cook on his second voyage, but some misunderstanding arising with regard to their accommodation in the vessel, they abandoned the project. On his return from the voyage the University of Oxford conferred on Solander the degree of Doctor of Common Laws. In 1773 he was appointed under-librarian at the British Museum. He died in a fit of apoplexy, in the year 1782.

The following papers were published with his name during his lifetime:—1. An account of the *Furia infernalis*, and the disease which it produces. It was published in Latin at Upsal, and appears to have been his inaugural dissertation. 2. An account of Gardenia, a plant belonging to the natural order Cinchonaceæ, in the fifty-second volume of the 'Philosophical Transactions.' 3. A botanical description of the plant producing the Cortex Winteranus or Magellanicus, published in the fifth volume of 'The Observations and Inquiries of a Society of Physicians.'

Although Dr. Solander published little with his name attached, his labours were by no means few or of little importance. He has left behind him a large mass of manuscripts, which are still existing in the British Museum, and containing, as they do, a vast store of information on all that passed under his observant eye, they afford abundant materials for the further prosecution of the subjects to which he devoted his attention.

The arrival of Dr. Solander in England may be looked upon as an important era in the history of botany in this country, as by his means the sexual system of arrangement of plants, which was only imperfectly understood in Great Britain, became more widely extended. We will not stop here to inquire into the amount of benefit conferred on botany by this system, which is now nearly exploded, but from the perfect knowledge of it possessed by Dr. Solander, and the zeal with which it was adopted by others, there can be no doubt that during his lifetime the cultivation of the Linnæan system had a very favourable influence in developing and extending a taste for botany in this country.

But botany was not the only department pursued by Dr. Solander. In 1786 the important work of Ellis on the 'Natural History of Zoophytes' was published, in the preface to which the editor thus expresses himself:—"For the arrangement and the descriptions, we are indebted to Dr. Solander, whose premature death prevented this, and other valuable works from appearing in so complete a manner as they otherwise would have done, since it must be universally allowed that the world suffered in Dr. Solander the loss of one of the greatest naturalists ever known, while his more intimate friends that of an invaluable member of society."

SOLANDRA, a genus of plants of the natural family of Solanaceæ, which has been thus named in compliment to Daniel C. Solander, LL.D. The name has been applied to other genera, but is now confined to a small Solanaceous genus, which is remarkable for the beauty and great size of the flowers of its species, which are natives of Mexico, Jamaica, and Brazil, with a doubtful species in Ceylon; forming large scandent shrubs, with broad alternate leaves crowded at the extremities of the branches with the solitary extra-axillary or terminal flowers. The genus is characterised by having a sheath-like calyx splitting on one side, and 2-5 cleft at the apex. Corol funnel-shaped and ventricose, with a plicate quinquefid limb and undulated lobes. Stamens five; anthers versatile, opening longitudinally. Berry pulpy, covered by the split calyx, 4-celled, many-seeded. These, being highly ornamental plants, are cultivated in our hot-houses, but, requiring moisture and much room, are difficult to flower. Sweet says the best way is to plant them in a loamy soil, and allow them to grow fast at first, till they have made a great many shoots; then keep them very dry till their leaves drop off, and they will produce plenty of flowers. The best way to have plants flower young is to take the cuttings from the flowering shoots.

SOLANINA, a vegetable alkali obtained by Desfosses from the berries of the *solanum nigrum*, and the fruit of the common potato.

In appearance solanina resembles sulphate of quina, but the crystals are finer and shorter; it restores the blue colour of litmus when reddened by an acid; dissolves in acids, and is precipitated from them by the alkalis. The hydrochlorate and acetate of solanina have a gummy appearance when evaporated to dryness, but the sulphate and phosphate are crystallizable. It is extremely poisonous; a grain of it dissolved in dilute sulphuric acid killed a rabbit in six hours.

According to Blanchet this alkali consists of—

Hydrogen	8·76
Carbon	58·87
Oxygen	30·73
Azote	1·64
	100·

SOLA'NUM, the name of one of the most extensive genera of plants, the type of the natural order Solanaceæ. This genus is distinguished by the following characters:—Calyx permanent, 5-10 parted. Corolla rotate. Anthers oblong, connivent, opening by 2 pores at the extremity. Fruit a berry, subglobose, 2-celled, sometimes 3 or 4 celled. The species are herbs or shrubs, unarmed or prickly, rarely spiny. The leaves are entire, sinuated or lobed, mostly alternate.

Upwards of 400 species of plants belonging to this genus have been enumerated, including many with apparently very opposite properties. The esculent Tomato, the Egg-plant, and the invaluable potato, with the various species of poisonous nightshades, are found united so closely by botanical characters, that it is impossible practically to separate them. The properties of these plants however do not differ in kind, but in degree, and the berries and leaves, and even the tubers when uncooked, of the potato, possess in a mild degree the narcotic properties of the poisonous nightshades. Many of them have also very handsome flowers, and are much cultivated in our gardens and green-houses. From the immense list of species belonging to this genus, we shall select for description a few of those that are used as medicines or food, or are much cultivated.

S. tuberosum, the common potato, is known in the genus by its tuberous subterranean stems, herbaceous stems without thorns, unequally pinnate leaves with entire leaflets, and articulated pedicels. It is one of the plants for which we are entirely indebted to America. It is found native in the greatest abundance on the western coast of South America. Like most plants which are much cultivated, an abundance of varieties have been produced from the original plant, and in the leaves, colour of the flowers, shape, size, and colour of the tubers, it has a great tendency to depart from its normal character. For an account of the introduction of this plant into Europe, its varieties, the mode of its cultivation and uses, see POTATO. Two other species of *Solanum*, viz. *S. Valenzuela* and *montanum*, produce edible tubers, but they are little used.

S. nigrum, common or garden nightshade: stem herbaceous without thorns; leaves ovate, bluntly toothed, and waved; umbels lateral, drooping. Throughout Europe, it is a weed in cultivated ground, and is also found in Africa and Asia. It is common in gardens, fields, and waste places in Great Britain. It has white flowers, producing small berries of a black colour.

S. dulcamara, woody nightshade, or bitter-sweet: stem shrubby, thornless, climbing, flexuous; leaves cordate, upper ones jagged; corymbs almost opposite the leaves. It is a native of Europe, Asia, and North America, in hedges and among bushes. It is plentiful in Great Britain. It has purple flowers and crimson berries, which latter may be mistaken by children for red currants, a mistake that has sometimes been attended with fatal consequences.

S. Melongena, egg-plant, mad-apple, Jew's-apple: stem herbaceous, woody at the base, clothed with star-shaped hairs; ovate, serrated leaves; flowering peduncles reflexed; fertile peduncle solitary, sterile one racemose; calyx campanulate; corolla angular. It is a native of the East Indies, and also said to be of Arabia. This plant has purple flowers, and bears large smooth shining berries, which are the shape and size of a small hen's-egg. Two varieties of this plant are recorded: the *S. M. ovigerum*, in which the stem, calyx, and leaves are without thorns; and the *S. M. esculentum*, in which these parts are more or less covered with thorns. Several subvarieties of both these are recorded, varying in the shape and colour of the fruit. The berries are mostly of a white colour, but in some of the subvarieties they are yellow, red, purple, and black. The fruit of this plant is used by the French and Italians in stews and soups. For this purpose the varieties used are the oval-shaped white, the globular-shaped white, and the purple or violet-coloured of both forms. In cultivating them they may be reared in hot-beds in a rich light soil, or in fine summers they will even produce their fruit in this country against a wall, if planted out in June after having been struck in a hot-bed.

S. Sodomeum, Sodom egg-plant, or apple of Sodom: stem shrubby, diffuse; prickles straight, dilated at the base; leaves oblong, sinuate, shining above, and rather scabrous and prickly on both surfaces; lobes obtuse angular; peduncles bifid. It is a native of the North of Africa and the South of Europe. The fruit of this plant is white, and about the size of a walnut. It is very subject to the attacks of an insect which deposits its eggs within the germen, and as the fruit enlarges, the larvæ of the insect, as in the case of many other fruits, destroy and pulverise the whole of the interior, whilst the rind is left unchanged and entire. When the fruit is gathered under these circumstances, it is crushed to pieces by the hand; or if conveyed to the lips, the mouth becomes filled with an ash-like powder, exceedingly bitter to the taste. To these berries remarkable properties have been assigned by Josephus, Tacitus, and others. Mandeville, an old English writer, says, speaking of the Dead Sea, 'And there besyden growen trees that baren fulle faire apples and faire of colour to beholden, butte whosoe breakethe them or cuttethe them in two, he shall find within them coles and cyndres.' Milton finely alludes to this fruit in the lines—

> 'Greedily they pluck'd
> The fruitage fair to sight, like that which grew
> Near that bituminous lake where Sodom flamed
> This more delusive, not the touch but taste
> Deceived, they fondly thinking to allay
> Their appetite with gust, instead of fruit
> Chewed bitter ashes.'

S. Sanctum, Palestine egg-plant: stem shrubby, tomentose; leaves ovate, repand, oblique at the base, clothed with hoary tomentum on both surfaces; berries nearly globose. This plant is a native of Palestine; it is often found in collections of plants. There are several other species of Solanum, which, on account of the size, form, and colour of their fruits, are called egg-plants, as *S. Indicum*, the Indian egg-plant, &c.

S. Æthiopicum, Æthiopian nightshade: stem herbaceous; leaves ovate, repand, angular; peduncles usually 1-flowered, drooping; berries torulose. It is a native of Ethiopia, China, and Japan. There are two varieties recorded: the one the *S. Æ. violaceum*, is a native of China, and the fruit is frequently eaten in that country as a dessert. It has a large spheroid oval berry of a red colour. The other variety is the *S. Æ. aculeuteum*, having a prickly stem, and small yellow berries of the size of peas.

S. pseudo-quina, false quina nightshade: stem shrubby, unarmed; leaves oblongo-lanceolate, narrow, acute, entire, glabrous above, but with fascicles of villi in the axils of the nerves beneath; racemes extra-axillary, short; calyx glabrous. This plant is a native of Brazil in the district of Curitiba, in St Paul without the tropics. The Brazilians use this for the same purposes as the quina or Jesuits' bark. It is intensely bitter, and may with advantage be used as a substitute for that bark.

S. verbascifolium, mullein-leaved nightshade: stem shrubby; leaves ovato-oblong, acuminated, entire, tomentose, white beneath, without any leaves in the axils; corymbs nearly terminal, dichotomous; calyx semi-quinquefid. It is a native of Asia, America, and the tropical parts of New Holland. This plant is frequently cultivated. Every part is covered with a powdery white tomentum. The flowers are white, and the berries are of the size of small cherries.

S. Lycopersicum of Linnæus, common Love-apple or Tomato. This, with some other of the older species of Solanum, now form the genus *Lycopersicum*, which is distinguished by possessing a calyx 5-6 parted; corolla rotate, 5-6 cleft; stamens 5; anthers conical, connate at their extremities by an elongated membrane, and dehiscing lengthwise inside; berry 2-3-celled; seeds villous. The present species is called *L. esculentum;* it has herbaceous pilose stems; unequally pinnate leaves; leaflets cut, attenuated at the apex, glaucous beneath; flowers many, united; berries torulose. This plant is a native of South America, but it is much cultivated and well known in the United States of North America, and in France, Germany, and Italy. When ripe, the fruit has an acid flavour, and is added to soups, sauces, &c. It is also used in confectionary as a preserve, and sometimes as a pickle. It is not often used in this country, but in Italy, near Rome and Naples, whole fields are covered with it, and scarcely a dish is served up into which it does not enter as an ingredient. In the cultivation of these plants, the seed should be sown in March in a hot-bed, and when two inches high, they may be pricked out into another hot-bed. In May they should be transplanted into a warm south border, where they may have the full sun, and the fruit may ripen quickly. The stem runs up 6 or 8 feet high, and should be trained to stakes or nailed up a wall or pales. The fruit begins to ripen in August, and may be gathered in October, and, when kept dry, will keep good till November. There are several varieties cultivated; the best are called the large and small cherry and pear-shaped red, and the large and small or cherry-shaped yellow. The size of the fruit is seldom larger than a golden-pippin apple. (Don's Miller, vol. iv., p. 444.)

Several other species of Solanum are recorded as having medical properties. *S. Jacquini* is considered by the native practitioners of India as an expectorant; *S. bahamense* is used as a gargle for sore throat in the West Indies; *S. mammosum*, *paniculatum*, and *cernuum* have the reputation of being diuretic and astringent. (Lindley's *Flora Medica*, p. 512.)

SOLA'NUM DULCAMA'RA, an indigenous perennial climbing plant, common in wet and shady places, especially hedges. It has a remarkably zigzag stem, with alternate leaves, the lower ones lanceolate, entire, the upper hastate; the flowers resemble those of the potato, but are smaller, and are succeeded by a cluster of red berries. This plant is called *woody* nightshade, to distinguish it from the Atropa Belladonna, or *deadly* nightshade. The young twigs or tops are officinal, and they should be gathered in spring, before the flowering of the plant, or in autumn, while the leaves are yet *fresh*, as much activity seems to belong to the leaves, and the twigs are best from plants about three years old. When fresh, the plant has an unpleasant odour, which is in a great measure lost by drying, as is also a large portion of water. The taste is at first bitter and slightly acrid, then sweet; hence the name *bitter-sweet* given to it.

Ten pounds of the dried twigs yield two pounds of extract. According to Pfaff, 100 pounds of perfectly dried stems yield a bitter sweet extractive (picroglycion), 21; vegeto-animal matter, 3; gummy extractive, 12; gluten with wax, 1; resin with benzoic acid, 2; gum, starch, salts (chiefly of lime), 8; and woody fibre, 62. Solanina has been found by Desfosses. Whether picroglycion is a distinct principle, or a combination of solanina with sugar, is doubtful.

Bitter-sweet, when taken fresh, has a slightly narcotic influence, causing also nausea, vertigo, and a dryness of throat, like other solanaceous poisons. If delirium display itself, it is always of a most frantic kind. Perspiration or an increased discharge of urine generally ensues, followed by gentle purging.

Bitter-sweet is chiefly employed in cutaneous diseases, especially of the scaly kind, such as lepra; it may be given internally, while a strong wash of it is applied externally. It is also useful in some vesicular diseases, such as herpes and eczema. In these its virtues as an external application may be increased by dissolving in it sulphuret of potass. This combination relieves most effectually the insufferable irritation of these complaints.

It is usually ordered in the form of decoction; but long boiling is destructive of its powers. Slow simmering is preferable. The extract, when prepared from the fresh plant with a low degree of heat, is a good form for internal administration, as it may be combined with antimonials.

In cases of poisoning by the berries, the stomach-pump should be used as speedily as possible, and moderate venesection is of service.

SOLAR CYCLE. [Periods of Revolution.]

SOLAR SYSTEM. We have given the elements of the planetary motions minutely in the several articles Mercury, Venus, &c., together with such physical peculiarities as belong to them severally, and independently of the System; the general phenomena of their motions have been deduced from the great principle of Gravitation; their history, as far as it is in the plan of this work to give it, has been treated in Astronomy. It remains to bring together the dimensions of the various parts of the system, and to notice such points as could not properly find a place under any of the heads just mentioned.

By the Solar System is meant that collection of bodies which contains the sun, the planets which revolve round him, their satellites, and such periodic comets as have had their returns successfully predicted. The system of the ancients includes the Earth as a fixed centre, with the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn. That of the moderns includes at this day the Sun as a governing body (but not as a fixed centre), Mercury, Venus, the Earth (with the Moon), Mars, Vesta, Juno, Ceres, Pallas, Jupiter and four satellites, Saturn (with the ring) and seven satellites, and Uranus with six satellites, besides the comets of Halley, Encke, and Biela. The following symbols are used to represent these bodies, to which we add the received explanation, without expressing any opinion about it:—

☉ Sun	♂ Mars	♃ Jupiter
☿ Mercury	⚶ Vesta (modern)	♄ Saturn
♀ Venus	⚵ Juno (modern)	♅ Uranus (modern)
⊕ or ♁ Earth (modern)	⚳ Ceres (modern)	
☽ Moon	⚴ Pallas (modern)	

The symbol for the Sun is all that modern abridgement has left of a face surrounded by rays: Mercury has the caduceus, or rod, entwined by two serpents: Venus a circular looking-glass with a handle: the Earth (a modern symbol) has a sphere with an equator, and also (with some) an inverted symbol of Venus. Those who first used it did not, we presume, know that they might be making a looking-glass turned upside down represent their planet. The symbol of the moon is obvious: Mars has what remains of a spear and shield: Vesta, an altar with fire on it: Juno, a sceptre: Ceres, a reaper's scythe: Pallas, the head of a lance: Jupiter, supposed to be a symbol of the thunder (arm and hand holding thunder?): Saturn, an altered form of a mower's scythe, the emblem of time: Uranus, the initial letter of Herschel, the discoverer's name, with a symbol of a planet attached. But others have thought that Mercury was designated by putting σ and τ together, the initials of στίλβων; Venus, from the first and last letters of Φωσφόρος; Jupiter, from the first and last letters of Ζεύς. These signs are found on very old manuscripts and gems, variously figured, but all with some general resemblance to the modern printed forms.

We are now to state the relative dimensions of the Solar System in a rough manner. This, we think, it may be useful to do in such a manner that any two planets may be compared with one another without computation.

And first, as to the relative distances from the sun, we have the following table:—

☿	100	54	39	25	15	74	41	20
♀	187	100	72	47	27	139	76	38
⊕	258	139	100	66	38	192	105	52
♂	394	211	152	100	58	293	160	79
⚶	610	327	237	155	90	454	248	123
⚵	690	369	267	175	101	513	280	139
⚳	715	382	277	182	105	532	290	144
⚴	716	383	277	182	105	533	291	145
♃	1344	719	520	341	197	1000	545	271
♄	2464	1319	954	626	361	1833	1000	497
♅	4955	2652	1918	1259	726	3686	2010	1000

This table is a succession of columns, each of which represents the comparative mean distances of the planets from the sun. In each column one of the distances is made 100 or 1000, and the rest are expressed accordingly; except only in the fifth column, in which the mean distance of the four small planets is made 100. Thus we see by inspection that Uranus is about 12½ times as far from the Sun as Mars; about 19 times as far as the Earth; about 26½ times as far as Venus; and about 7¼ times the mean distance of the four small planets. Also, taking the mean distance of the small planets, we see that the distances from the sun are as the numbers 15, 27, 38, 58, 100, 197, 361, 725; and if we take the first away from all the rest, we have 12, 23, 43, 85, 182, 346, 710; in which it will be observed that each is about double of the preceding. Kepler had observed a progression, without assigning a law; and had also noticed that one term appeared to be missing. Bode assigned the law which has just been noticed; noticing also the apparently missing term. The existence of a planet between Mars and Jupiter was accordingly suspected; and at last, to the astonishment of astronomers, four little bodies, looking more like fragments of a planet than planets, were discovered at a distance from the Sun so near to that which had been suspected, that their mean distance fills up its place in the series as well as that of any other planet. It was of course immediately suspected (when only two had been discovered) that these were remains of some planet which had been shattered by explosion or other cause; and the encouragement which this idea gave to look for further fragments, was perhaps one of the main causes of the discovery of the remaining two. This law of Bode, as it has been called from the astronomer who first noticed it, may be thus expressed: if a be the distance of Mercury, and $a+b$ of Venus, then $a+2b$ is that of the Earth, $a+4b$ of Mars, $a+8b$ of the small planets, $a+16b$ of Jupiter, $a+32b$ of Saturn, and $a+64b$ of Uranus; all nearly.

To convert the above relative distances into actual ones, consider the distance from the sun to the earth as 23984 mean semidiameters of the earth, the mean semidiameter being 3956 miles; so that the distance in question is 95 millions of miles. The semidiameter of the sun is 111·454 times that of the earth; so that the distance of the earth from the sun may be called 215 semidiameters of the sun. One of our objects in this article is to correct the absurd notions derived from the playthings called orreries, and the diagrams exhibited in books and lectures. Let the capital letter O of the type which stands at the beginning of the article in this work represent the sun; then the earth is a speck which would need a good microscope to shew it; and its distance from the sun is represented by 11 inches, or nearly two inches more than the length of one of our columns. Sir John Herschel describes the Solar System thus:—

Planet.	Object which represents it.	Representative of its distance from the Sun.
Sun.	Globe of 4 feet diameter.	
Mercury.	Grain of mustard seed.	164 feet.
Venus.	A pea.	284 feet.
Earth.	A pea.	430 feet.
Mars.	A rather large pin's head	654 feet.
Juno, &c.	Grains of sand.	1000 to 1200 feet.
Jupiter	A moderate sized orange.	Half a mile.
Saturn.	A small orange.	⅘ of a mile.
Uranus.	A full sized cherry, or small plum.	A mile and a half.

The *excentricity* of a planet means the fractional part of a planet's mean distance by which its greatest or least distance exceeds or falls short of the mean distance. Arranging the planets in the order of their excentricities, we have

For Venus	·007	For Saturn	·056	For Mercury	·206
„ Earth	·017	„ Ceres	·078	„ Pallas	·242
„ Uranus	·047	„ Vesta	·089	„ Juno	·258
„ Jupiter	·048	„ Mars	·093		

That is, if the mean distance of Venus were called 1000, its greatest distance would be only 1007 and its least 993. But if the mean distance of Juno were called 1000, its greatest distance would be 1258 and its least distance 742.

We now give a table for the times of revolution, similar to that given for the distances:—

☿	100	39	24	13	6	20	8	3
♀	255	100	62	33	14	52	21	7
⊖	415	163	100	53	23	84	35	12
♂	781	306	188	100	44	159	65	22
⚶	1507	590	363	193	84	306	126	43
⚵	1810	709	436	232	101	368	151	52
⚳	1911	748	460	245	107	388	160	55
⚴	1917	751	462	246	107	389	160	55
♃	4925	1929	1186	631	276	1000	412	141
♄	11950	4680	2878	1531	669	2428	1000	343
♅	34880	13660	8401	4467	1952	7082	2918	1000

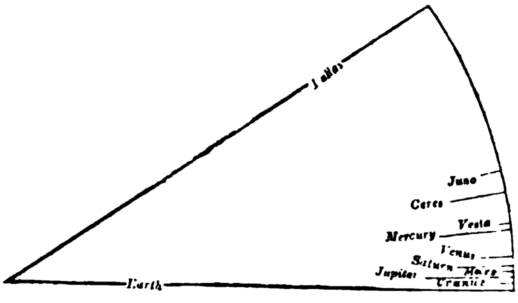
The explanation of this table resembles that of the preceding one, times, instead of distances, being the objects of comparison. Thus, if a revolution of Jupiter contain 1000 parts of time, that of Saturn has 2428 such parts: and the revolution of Uranus is 84·01 as long as that of the earth.

In the following table will be seen the absolute time of revolution in days, and also numbers expressive of the comparative angles moved over in a day by each planet, and the intervals (in days) between two conjunctions with the sun:—

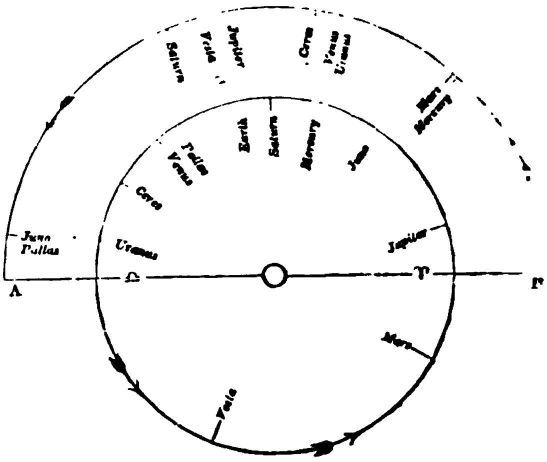
	Rev.	Int. of Conj.	Comp. Ang.		Rev.	Int. of Conj.	Comp. Ang.		Rev.	Int. of Conj.	Comp. Ang.
☿	88	116	1137	⚶	1326	503	75·4	♃	4333	399	23·1
♀	225	584	445	⚵	1593	474	62·8	♄	10759	378	9·29
⊖	365	—	274	⚳	1681	467	59·5	♅	30687	370	3·26
♂	687	780	146	⚴	1687	466	59·3				

Thus, Venus revolves in 225 days (all the numbers in this article are more roughly given than in the articles specially devoted to the planets); is in conjunction with the sun at intervals of 584 days; and, with its mean motion, would describe 274° in the heavens while Jupiter describes 23°·1. Saturn moves 2·01 minutes daily; the earth, 59′ 8″·3.

The minor elements (in a general consideration) may be best described by diagrams; the inclinations of the orbits may be represented by the following lines, which show the slope or inclination of each orbit to the orbit of the earth or plane of the ecliptic. None of the old planets have an inclination of more than 7°, while in the new planets the same element varies from 7° to 35°.



In the next figure the plane of the ecliptic is represented: OB is the line which points to the astronomical first point of Aries, or the vernal equinox, and the arrows represent the directions of the planetary motions. On the outer circle are represented the longitudes of the ascending nodes of the different planets, or the lines in which they are found when they rise through the ecliptic from the southern to the northern side of it. On the inner circle are represented the longitudes of their perihelia, or points of nearest approach to the sun. The slow changes which take place in these elements are noted in the articles devoted to the different planets.



Jupiter and his satellites might be enclosed in a sphere having a radius of about 2½ times as great as that of the sun; Saturn and his satellites in a sphere of 7¾ the radius of the sun; and Uranus and his satellites in a sphere of 4½ the radius of the sun. The earth and moon [Moon] might be contained in a sphere of one-half the radius of the sun.

In apparent diameter Mercury varies from 5″ to 12″, Venus from 10″ to 61″; Mars from 4″ to 18″; the small planets have diameters hardly measurable; Jupiter from 30″ to 46″; Saturn from 14″ to 18″; Uranus from a little less to a little greater than 4″.

If the radius of the sun were divided into 1000 parts there would be as follows in the radii of the several planets: —Mercury, 3½; Venus, 8¾; the Earth, 9; Mars, 4¾; Jupiter, 97½; Saturn, 85; and Uranus, 39. If the bulk of the sun were divided into a *million* of parts, Mercury would be a little less than one-twentieth of one of the parts; Venus, two-thirds of a part; the Earth, three-quarters of a part; Mars, one-tenth of a part; Jupiter, 925 parts; Saturn, 720 parts; Uranus, 58 parts. The Moon is about the third part of Mercury in bulk.

The mass of the planets varies very much from what it would be if they were nearly of the same substance. From the effects of the planets in attracting their satellites, compared with the effects of the sun upon themselves, it is found that if, according to Cavendish's experiment, we take the earth to be, at a mean, 5½ times the density of water, or about half that of lead, the sun may be considered, as to density, to be made of asphaltum, or rather heavy coal; Jupiter of the same; Uranus of a material very little heavier: Saturn of maple-wood; the Moon of diamond or topaz. By other modes, of course, than that of their satellites, Mercury is found to be three times as dense as the Earth, Venus of about the same density; and Mars about three-quarters as dense as the Earth.

The sun revolves about its axis in about 25½ sidereal days; Mercury, Venus, the Earth, and Mars, all revolve in about the same time, from 23½ h. to 24½ h.; Jupiter and Saturn severally revolve in about 10 h. and 10½ h. About Uranus nothing is known in this respect.

From what precedes, a sufficient general notion may be collected of the dimensions of the Solar System, and we now proceed to some other points connected with it. As to its place among the fixed stars, it is only within the last two years that the distance of any star from our system may be said to have been positively measured. [Parallax.] The star 61 Cygni is shown to be more than 340,000 times as far from our system as its most distant discovered planet is from the sun. As to the question of the motion of the Solar System in space, no such phenomenon has been made apparent. Were any such motion to exist, of a degree sufficient to have a sensible effect, it is obvious that the stars which the system is leaving would appear to draw nearer together while those to which it is approaching would appear to become wider apart. W. Herschel thought at one time that some such phenomenon was slightly perceptible, and that the system was in motion towards the constellation Hercules; but the fact has received no confirmation. That the whole System is in motion more or less, mechanical considerations make almost certain. Whatever motion the cen-

[illegible] had at any one time, it is demonstrable that it has been conferred, except by the attraction of the fixed stars; and it is unfair to argue against there having been a centre whatever of this centre at the time when the system received its organization. And if there be any attraction from the fixed stars, however little, some motion must be produced. Centuries of close observation of double stars may, and probably will, detect the motion of our system. All that can be said up to the present time is that, be it what it may, it is exceedingly small, compared with the distance of our System from those stars.

The next question may be, is there any evidence in our System of any secondary law of formation, indicating a connexion between the mode of creation of one planet and another. The will and power of the Creator are the final cause both of the initiation and maintenance of that vast system; but in the latter there are visible secondary laws, that of gravitation, for instance; were there any in the former? Attempts at investigation on this point have been frequently considered atheistical; a foolish notion arising out of those views to which we have alluded in MOTION, p. 452. Those who can only think of the *Creator* and forget the *Maintainer*, and who virtually separate the office of the latter, and give it to the 'laws of nature,' may reasonably fear that they would have to give up also the former office to the 'laws of creation,' if such were found; which would be (but owing only to their own interpretation of the manner in which the world continues to exist) a renunciation of the idea of Deity in the contemplation of the manner in which it began to exist. But to those who keep constantly in view the fact which no Theist disputes, that the same power which created continues to create in preserving, and that the 'laws of nature' are only expressions of the manner in which this preservation is seen to act, will look upon the 'laws of creation' to be as simple and natural an object of philosophical inquiry as those of the ascent of sap in a plant, or of the revolution of a planet. The proper reply to a charge of atheism brought against those who investigate any mode of action of the Creator of the universe at any *past* time is the retort of semi-atheism against those who make it.

Many speculations have been made upon the formation of the several planets, but none which had any appearance of connecting the phenomena of one planet with those of another, except by Laplace (*Système du Monde*, vol. ii., p. ?), in what has been called the nebular hypothesis. This conjectural theory, which is well worthy of attention, never received any particular notice, to our knowledge, from any writer in this country, until Mr. Whewell's 'Astronomy and General Physics,' the third of the Bridgewater Treatises, appeared, in which it is announced that the nebular theory was ushered in with expressions which showed Laplace to be a professor of atheism. What Laplace really thought on these subjects, as we have said before [LAPLACE], we do not know, nor would it really matter if he were what he was represented to have been; for a conjecture may be ingenious, and a theory sound in its details, even though its author [illegible] stand in the place of a Creator. But considering the [illegible] associations connected with such a charge, it will be well to examine into the fact whether there was any such announcement; and to do this fairly, we must quote both Mr. Whewell and Laplace. The former says,—'We have referred to Laplace as a profound mathematician, who has strongly expressed the opinion that the arrangement by which the stability of the Solar System is secured is not the work of chance; that "a *primitive cause* has directed the planetary motions." This author however, having arrived, as we have done, at this conviction, does not draw from it the conclusion which has appeared to us so irresistible, that "this admirable arrangement of the Solar System cannot but be the work of an intelligent and most powerful Being." He quotes these expressions, which are those of Newton, and points at them as instances where that great philosopher had deviated from the method of true philosophy. He himself proposes an hypothesis concerning the nature of the *primitive cause*, of which he conceives the existence to be thus probable.'

Here are two assertions:—1. That it is the doctrine of an intelligent Creator which Laplace 'points at' as a deviation from true philosophy; 2. That Laplace proposes his nebular hypothesis as a primitive cause. We pay a writer of Mr. Whewell's eminence the compliment of inserting here matter which would more appropriately appear in a review of his work; but we deny that Laplace has been well described in either assertion. Our object is to clear the nebular hypothesis from the unphilosophical character with which its first appearance is thus presented, and by no means to uphold the moral dignity of Laplace. Until the [illegible] facts connected with his treatment of his benefactor (Vol. xiii., p. 325) are answered or explained, that great mathematician must be called a time-server; and we suspect that his 'Système du Monde' only treats the intelligent Creator whom his mind acknowledged, in the same manner as his after-conduct treated Napoleon. It was published in 1796, a period which would well explain the mere suppression of all allusion to the Supreme Being; and one of these things must be true; either Laplace was what Mr. Whewell styles him, or he had not the courage to declare himself otherwise in his age and country. But what we have here to do with is the assertion that he did more—that he *attacked* the doctrine of a Supreme Being. His words are as follows, the passages to which we wish to draw attention being in italics:—'I cannot here help observing how much Newton has departed on this point from the method which he elsewhere so happily applied. After the publication of his discoveries, this great geometer, abandoning himself to speculations of another nature, *inquired into the motives which made the Author of nature give to the Solar System the constitution which we have described.*' Laplace then quotes Newton's Scholium (PRINCIPIA, pp. 10, 11, where we have translated the whole) thus: '"*And all these regular motions have no origin in mechanical causes*,"* &c. &c. down to "all parts of the heavens."' He then further quotes, 'This most elegant group, &c. can only arise from the design and government of a powerful and intelligent Being.' He (Laplace) continues thus, speaking, so far as the mere notion of a Supreme Being is concerned, rather in approbation: 'He repeats the same thought at the end of his Optics, in which he would have been still more confirmed if he had known what I have demonstrated, namely, that the arrangement of the planets and satellites is precisely that which makes a certain provision for their stability. "Blind destiny," says Newton, "can never make the planets move thus with such small irregularities, which appear to come from the mutual action of the planets and comets, *and which will probably become greater and greater in the course of time, until at last the System will again require its author to put it in order.*" But,' proceeds Laplace, 'may not this arrangement of the planets be itself a consequence of the laws of motion, and may not the Supreme Intelligence, which Newton makes *to interfere*, have already made it depend upon a more general law? *Are we to affirm that the* [unlimited] *preservation of the Solar System is a part of the intentions of the Author of nature?*' This we should sum up as follows: Laplace charges Newton with a departure from philosophical principles in—1. Speculating on the motives of the Creator;† 2. Assuming the probability that his works would not last his time without his own supernatural interference; 3. Assuming that he intended to preserve the Solar System for ever. But Mr. Whewell singles out only one part of Laplace's quotation, and without paying any attention to the remarks which explain his meaning, declares that Laplace 'pointed at' Newton's declaration of belief in God as a piece of bad philosophy; whereas this part of his quotation is only followed by the remark how much stronger he himself (Laplace) had been able to make the sort of evidence on which Newton rested; and the sentence selected by Mr. Whewell as 'pointed at,' coupled with the remark specially made on that sentence, has rather the appearance of being pointed at with approbation. With regard to the assertion that Laplace propounded the nebular theory as a *primitive cause*, it is true that he did so in his own sense of the words. Mr. Whewell means by primitive cause a first cause, as those words are usually understood; and he asks (and the question would have been much to the purpose if Laplace had really meant the same thing as himself by the words *primitive cause*), 'Was man, with his thought and feeling, his powers and hopes, his will and conscience, also produced as an ultimate result of the condensation of the solar atmosphere?' But Laplace speaks as follows: 'Quelle est cette *cause primitive*? J'exposerai sur cela, dans la note qui termine cet ouvrage, une hypothèse,' &c. And in the very first words of this note we find, 'On a, pour remonter à la *cause* des mouvemens *primitifs* du système planetaire,' &c. This then is what Laplace understood by *primitive cause*, a *cause* of the *primitive* motions;—an improper use of language, if the reader pleases; but when a man puts his own meaning on his own words, no one has a right to fix the consequences of another meaning upon him.

---

* Laplace evidently thought that by mechanical causes Newton meant [illegible]

† Newton's Scholium does not seem to us to [illegible] Laplace's approval or disapproval of it [illegible] of Newton's [illegible]

We now proceed to the nebular theory, which is a conjecture proposed with much doubt by Laplace, as a possible explanation of the manner in which the *motions* of the several planets obtained those remarkable resemblances which are found to subsist, without making the inquiry extend to anything except their motions. All the planets move in one direction round the sun, and their satellites move in the same direction round themselves; those that are known to revolve round their axes (and the contrary has been proved of no one of them) also revolve in the same direction, and their equators are not much inclined to their orbits. The excentricities of the planets and satellites are in no case very large, and generally very small; and the inclinations of their orbits to one another are generally small. Many nebulæ in the heavens appear, when examined, to consist of a bright nucleus surrounded by nebulous matter; in others it is found that the apparently nebulous matter consists of stars. This gave Laplace the idea that our System might originally, that is, previously to the establishment of its present order, have been a large nebula of which the sun was at the centre. Imagine a large nebulous mass in a state of revolution, with a solid or at least less nebulous centre, round which it revolves: call this central nucleus the sun. Assume the ordinary laws of matter to be true of this nebulous mass; and also that it extends as far as such an atmosphere can do; namely, until the attraction of the whole upon particles at the equator is equal to the centrifugal force of those particles. If condensation should begin to take place, arising from loss of heat, the mass would revolve more and more rapidly as it was condensed into less and less space; but it does not follow that the equatorial particles would fall in towards the centre: they are balanced by the equality of the centripetal and centrifugal forces; and might form a ring round the rest of the mass. If the process were conducted with great regularity, this ring and the mass of vapour might undergo continual condensation together, until the increasing velocity of rotation prevented the formation of the ring from continuing. The departures from complete regularity which might exist in the mass might cause disturbances in the formation of the rings, which might end in there being one or more (not many) permanently revolving round the rest of the mass condensed into a solid body, in the manner of Saturn and its rings. Such regular formation however might be rarely continued long enough; and if the rings got broken, each ring would become several masses, which would revolve nearly at the same distance, and nearly with the same velocity: such a result is seen in the four small planets. But as, generally speaking, these masses would, by irregularities in their velocities, be combined into one* at last, each broken ring would form a new nebulous mass, revolving round the diminished central nucleus: and if a number of such masses were formed, those nearer to the central mass would move with the greater velocity, and would be both smaller and denser than the external ones: the first circumstance certainly, the second and third most probably. Again, each mass would have a motion of revolution in the same direction [Motion, Direction of] as the motion round the primary; for when the ring becomes broken, its internal parts have a somewhat more rapid motion than the external ones, which would give the motion of rotation noticed. And the rotations thus created in the internal masses would probably be greater than those in the external masses. The orbits of the masses would necessarily be nearly circular, and not much inclined to each other: but for irregularities, quite circular, and in the same plane. In each of the nebulous masses, thus detached and revolving, condensation might again give rings or satellites or both; but in all probability the external masses would get more satellites than the internal ones: the orbits of the satellites must be also nearly circular, and not much inclined. All the preceding circumstances, both those which are certain and those which are probable (Laplace confined himself to the former), are actually existing in the Solar System; consequently this hypothesis, though subject to serious difficulties, deserves attentive consideration, as often as any new knowledge of the constituent parts of our system shall render a reference to it likely to produce evidence on one side or the other. As a substitute for intelligent creative power, if such a thing were intended, it would do no better than any other; for, as Mr. Whewell observes, a man with will, power, and conscience, cannot be admitted to be a necessary consequence of the cooling of a nebulous atmosphere. Nevertheless, as exhibiting a possible mode in which the Creator of mind and matter made the laws of formation resemble those of continuation, as far as the motions of the system are concerned, this hypothesis is strikingly explicative of what we really see. But even if we were to take it to be a true explanation, it would only be one step of the ascent, and the next question would be, what higher process distributed the parts of this nebulous mass in such a manner as to place those outermost which were fit to form a planet so distant from the source of light and heat as Uranus, and to support the appropriate forms of animal and vegetable life which analogy would induce us to suppose must exist there.

The history of astronomy teaches us that the system in which we live has not undergone any apparent change for more than 2000 years; and, on inquiring into the connection which exists between one planet and another, or the laws of gravitation, it is found that so far as their mutual actions are concerned, there is no reason why any change ever should take place. If the central body were the only one which attracted the rest, and as long as the laws of matter remained unaltered, it is certain that nothing could alter the revolutions of a system of planets, unless two orbits intersected, and the planets of those orbits happened to come to the intersecting part at the same time, and to strike each other. But the planets are subject to the action of each other as well as to that of the sun, and no instant elapses without every orbit undergoing a slight change from every one of the planets of the other orbits. Jupiter alone produces on the earth's orbit in one year more change than we have any right to say all the comets put together would do in a hundred. And yet the system not only continues without any sensible change, but, one circumstance alone excepted, to which we shall presently allude, is demonstrably formed to continue for a most enormous length of time, unless some new action should arise, or some external cause begin to operate. As it is sometimes stated that a complete mathematical demonstration has been given of the *eternal* stability of the Solar System, so far as the mutual actions of its parts are concerned—an assertion which is altogether incorrect—it may be worth while to enter a little on the details of this subject.

The disturbing forces of the planets on each other cannot have their effects calculated all at once; but each force must be divided into an infinite series of terms, the first of which contains all the terms of the first dimension, the second all those of the second, and so on. Of all these terms each is much less in its effect than the preceding; so that in fact the first two dimensions are all that produce any sensible effect in any time which it is worth while to consider. Occasionally it happens that terms of the third and fourth dimensions have been required to be used, but almost all the sensible perturbations of the system depend on terms of the first two orders. As far as any effects arising from such terms are concerned, Lagrange and Poisson are admitted on all hands to have demonstrated the stability of the Solar System: and considering the nature of the process employed and there being no appearance of any circumstance which looks likely to lead to a different result in any of the remaining terms of the disturbing forces, it may be highly probable that a further investigation would show the same thing, if all the dimensions of the disturbing forces were employed. Sir J. Lubbock (*Phil. Mag.*, February, 1 has pointed out the forms which further investigation would apparently produce, and which would (unless a detailed investigation should lead to something not discoverable *a priori*) bear out as certain what we have just stated to be probable. But though all the presumptions lie on the side of those who would assert the proposition absolutely of all dimensions of the disturbing force, it is not yet time to say that it is a certain mathematical consequence of the theory of gravitation.

---

* If any number of masses, capable of cohering, revolve in orbits so near to one another that they must cohere when they come to their minimum distance, nothing but an absolute and mathematical equality in their mean velocities can keep them permanently asunder; the smallest inequality must at last bring them all together.

When the effects of perturbation are examined, as far as the first functions of the disturbing force, it appears that the smallness of the mass of the sun compared with that of any planet, the great distance of the planets from each other as compared with their amounts of departure from spherical form, the small eccentricities and inclinations of their orbits, and their motions being all in one direction, give the following mathematical consequences of the law of attraction:—First, the longest or major axes of the planets' orbits are not subject to any slow variations of very long period; all their variations being excessively small, and soon destroyed by the production of contrary variations. It is very often stated that the major axes are subject to no variation; this is to be understood only of secular variation (or of very long period). One year is not precisely the same as another to any fraction of a second; but the average year of one long period is precisely the same as that of another; or at least the mean years of the two periods become more nearly equal the longer the periods are made. But the eccentricities and inclinations are subject to long periodic alterations, the times of their recurrence not being exactly settled, from the difficulty of their determination. How then is it known that they are periodic? For instance, the eccentricity of the Earth's orbit is subject to a yearly diminution of ·00004, its value in 1801 being ·0168. Had this diminution been an increase, as it is in Mercury and Jupiter, it might *à priori* appear possible that this increase should continue until the orbit (preserving the same major axis) should be so elongated that the alternate approach to and recession from the sun should give our planet the alternate climates of Mercury and Mars, and thus no doubt destroy it as the abode of beings constituted like ourselves. It is found however that the following relation must exist:—If at any one moment the square of the eccentricity of each planet be multiplied by its mass and the square root of its mean distance from the sun (represented in numbers), the sum of all these products must be the same as it was at any moment past, or will be at any moment future. And if in each product the tangent of the inclination to a fixed plane be substituted for the eccentricity, the resulting equation is true. From such relations as these, and others connected with them, it is shewn that so far as the mutual actions of the planets are concerned, no one eccentricity nor inclination can increase indefinitely, but all their changes must be periodic, and confined within rather small limits. The approach of the ecliptic to the equator, for instance, which amounts to about half a second in a year (and which leads speculators sometimes to talk about a past time when the ecliptic passed through the pole, and a future time when it will coincide with the equator), must stop long before the ecliptic reaches the equator, and attain a minimum inclination, after which the two will begin to separate; the whole oscillation being less than three degrees. The whole result is summed up thus: As far as terms of the second order (inclusive) in the disturbing forces, and as long as only the mutual attractions of the planets act, there is a mathematical certainty that the solar system will remain in its present state, the elements of the different orbits oscillating about certain mean values, from which they are never very distant; except only the longitudes of the nodes and perihelia, which change with motions which are always very near to a certain mean motion. The probability is very small that the higher functions of the disturbing forces would affect this result, and certainly only in a length of time to which the longest periods known are trifling in comparison.

This last point however is of the less importance, since it has become highly probable, within the last few years, that an external cause does exist, which must, unless there be a counteracting force of which we know nothing, in time cause the destruction of the system. If the planets move in any medium which resists their motions, however little, the consequence must be a gradual diminution of their mean distances from the sun, and a gradual increase of their velocities, ending in their absolutely falling into the sun. For the presumption in favour of the actual existence of such a resisting medium, see COMET, p. 393. This resisting agent seems to show a rapid effect upon so attenuated a mass as Encke's comet, though thousands of years have elapsed without its producing any sensible effect upon the planets. Little as it may concern us directly, these speculations have an interest, both as to the glimpse they give of the possible destiny of our system, and from their connexion with the history of past and the hope of future discovery. It is to be remembered that no subject has drawn out so much of mathematical talent, or indirectly exerted such an influence upon other branches of physical research, as the application of the theory of gravitation to the development of the planetary motions.

For more detail upon the subject, in a popular manner, the English reader may consult Sir John Herschel's 'Treatise on Astronomy,' in the *Cabinet Cyclopædia*, or Mrs. Somerville's 'Treatise on the Physical Sciences.'

SOLA'RIO, ANTONIO DE, called 'Il Zingaro,' or the Gipsy, was born in 1382, at Civita, in the Abruzzi, according to Dominici (*Vite de' Pittori Napolitani*), but others have contended that he was a Venetian. He was a gipsy by birth, and in his youth was a sort of itinerant blacksmith. He was not a mere tinker, a mender of kettles and saucepans, for he is said to have been admitted into the house of the painter Colantonio del Fiore at Naples, on account of his skill in making implements of iron. Nearly the same story is related of Solario as of Matsys, the blacksmith of Antwerp. [MATSYS.] Solario fell in love with the daughter of Colantonio, and she fell in love with him. Solario made proposals, but Colantonio said that he would never consent that his daughter should marry any one but a painter of reputation at least equal to his own. The gipsey was not to be thus got rid of; he asked to be allowed ten years to study the art, and Colantonio, to satisfy his daughter, assented. Solario became a pupil of Lippo Dalmasi at Bologna, with whom he remained six or seven years, and afterwards travelled through the chief towns of Italy in order to study the works of other masters. In rather more than nine years he returned in disguise to Naples, and having presented to the queen of Naples a picture of the Virgin, with the infant Jesus crowned by angels, and also been permitted to paint a portrait of the queen, Colantonio was then invited to view the productions of the unknown artist, of which he expressed the highest admiration. Solario then discovered himself, and soon afterwards became the son-in-law of Colantonio. His reputation was immediately established, and he was much employed, especially at Naples, in painting altar-pieces, and in decorating the walls of convents and other religious houses with frescoes. In the fine expression of his heads, and in the richness and harmony of his colouring, he has been compared to Titian. He is also praised for the graceful action of his figures, but is said to be defective in the drawing of the hands and feet. Solario was also distinguished as an illuminator of manuscripts, especially Bibles. He died in 1455. Vasari has not included Solario in his 'Lives.'

SOLA'RIUM. [TROCHIDÆ.]

SOLDA'NIA. [FORAMINIFERA, vol. x., p. 348.]

SOLDERING, according to Dr. Ure (*Dict. of Arts, &c.*), is 'the process of uniting the surfaces of metals, by the intervention of a more fusible metal, which, being melted upon each surface, serves, partly by chemical attraction, and partly by cohesive force, to bind them together.' In accordance with this, which is the ordinary acceptation of the word soldering, a solder may be defined as a metallic cement employed to unite, by being fused between them, two pieces of metal. Such an explanation however, though correct in most cases, does not apply to every kind of soldering; a process having been recently introduced by which pieces of metal may be perfectly united without the interposition of solder.

In the ordinary mode of soldering, the alloy used as a solder must be more fusible than the metal or metals which are to be united, and must have a strong affinity for them. The solder usually contains a large proportion of the metal to which it is to be applied, in combination with some more easily fusible metals. To insure perfect metallic union between the solder and the surfaces to which it is applied, it is essential that they be made perfectly clean and free from oxide, and that the atmosphere be excluded during the operation, in order to prevent the formation of any oxide while the process is going on. This is effected in various ways, but most commonly by the use of borax, sal ammoniac, or resin, either mixed with the solder or applied to the surfaces to be joined. Mr. Thomas Spencer, of Liverpool, has recently made some interesting experiments, the results of which are given in a paper 'On the Theory and Practice of Soldering Metals,' which was read before the Liverpool Polytechnic Society in May, 1840, and published in the 'Mechanic's Magazine,' vol. xxxii., p. 729, &c. An almost infinite variety of alloys are used in different kinds of soldering, the principal of which, as recommended by the best authorities, will be described below, classified according to the metals which they are commonly used to unite.

Platinum is soldered, according to Dr. Ure, with fine gold.

For *gold* it is usual to employ an alloy of fine gold with silver or copper, or with both of those metals. These are sometimes used in the following proportions:—pure gold twelve parts, pure silver two parts, and copper four parts. The metals are fused together, beat into thin leaves, and then softened by annealing. Borax mixed to a thick consistence with water is applied to the joint, and the solder is melted by the blowpipe. It is stated in Brewster's 'Edin. Ency.,' that the borax may be removed by boiling water, or diluted sulphuric or muriatic acid; and that the paleness of the solder may be remedied by melting upon its surface a mixture of two parts of nitre and one of burnt alum, and then washing it off with hot water. The same authority states that gold articles may be cleaned after soldering by boiling them in urine and sal ammoniac, and those of silver by boiling in alum-water.

Silver solders usually consist of silver mixed with brass, and sometimes with zinc. Dr. Ure states that pure tin is occasionally used as a solder for silver, but that the solder commonly used is an alloy of five parts silver, six brass, and two zinc. Some authorities give nineteen silver, one copper, and ten brass, as the proportions in jewellers' silver solder; and two parts of pure silver to one of brass as the composition of solder for plating. Another solder for coarser silver has four parts silver to three of brass, with a little borax; and a hard silver solder is made of equal parts of silver and fine brass. The addition of zinc softens this alloy. Mr. Gill, in an article on soldering in jewellery, in the 'Technical Repository,' vol. ii., p. 63, states that the thin laminated solder is cut up into very small bits, and applied with borax and water. The article to be soldered is laid on charcoal ashes, and submitted to the jet of a blowpipe. To prevent the solder from spreading over the surrounding parts, they may, he observes, be coated with Indian ink laid on with a camel's-hair pencil. The fluid borax is also applied with a hair-pencil, and the solder with the end of the ivory handle on which the pencil is fixed. Filagree-work is soldered in a somewhat different manner; the minute parts being laid together in their proper position on a flattened piece of charcoal, which is smeared with a thick solution of gum tragacanth to hold them steady. The fluid borax is then brushed over, and the solder, reduced to a fine powder, is sprinkled upon it. In this as in all other kinds of soldering, whenever several parts must be successively put together, it is necessary to use solders of different degrees of fusibility; the least fusible being used first, so that the joints made with it may not be disturbed by the heat of the subsequent operations.

Spelter solder is used for brass, copper, and iron, and consists of zinc (spelter) mixed with copper or brass, and sometimes also with tin. The proportions vary greatly. Gill gives eighteen parts brass, three zinc, and two tin; or sixteen parts copper, sixteen zinc, and one tin. (*Technic. Rep.*, i., 432.) Dr. Ure says it consists of zinc and copper in nearly equal parts. Brewster's 'Edin. Ency.' describes it as consisting of two parts zinc and one brass, and observes that the addition of one dwt. of silver to each ounce is a great improvement. In the 'Dict. Technologique,' as quoted in vol. vi. of Gill's 'Technical Repository,' p. 181, the following solders for copper are mentioned:—eight copper and one zinc, which form a very hard yet fusible and malleable solder; three copper and one zinc; and ten copper and one zinc. The latter forms the hardest but least fusible solder. Generally the addition of copper increases the hardness and diminishes the fusibility of the alloy. For hard brass solders the same proportions are recommended, but brass is substituted for copper. The proportions may vary, it is stated, from two to sixteen parts of brass to one part of zinc. Six brass, one zinc, and one tin, form a soft solder for brass. An alloy of two parts copper and one part tin is sometimes used as a hard solder. All the above-mentioned hard solders are granulated, and applied to the joint in the form of a coarse powder.

Articles of *wrought-iron*, and some qualities of *steel* also, may be soldered with cast-iron; the cast-iron being repeatedly heated and quenched in water, by which it becomes sufficiently friable to be beaten to a coarse powder with an iron pestle and mortar. Several papers respecting this method of soldering were published in the 'Technical Repository,' vols. i., iii., and iv.; from which it appears that the process was, about sixteen or eighteen years ago, practised in such a way as to lead to the supposition that it was rather a welding than a soldering operation; the solder being applied in the form of a black shining composition resembling pitch, which Mr. Gill conceived to be cast-iron powdered and mixed with glass of borax; and the joints being subjected to a slight hammering. The parts united by this means are stated to be scarcely distinguishable. In making fine steel instruments, gold, either alone or with a slight alloy of copper, is often used as solder. Silver solder, being less expensive, and nearer the colour of the steel, is preferred by some for this purpose. An alloy of nineteen parts fine silver, one copper, and two brass, has been recommended for steel joints. In larger articles of iron and steel, a solder consisting of equal parts of tin and iron is sometimes used.

Common *plumbers'* solder is made of two parts lead and one part block tin; or of the same metals mixed in nearly equal quantities; bismuth is added when it is desired to make the alloy more fusible. Soft solder has two parts tin to one lead; and other alloys of tin, lead, and bismuth, are used for uniting various articles of lead, tin, pewter, and other soft compounds. Such highly fusible solders are usually cast in ingots or strips, and melted as they are used by means of an instrument called a soldering-iron, which is tipped with copper—that metal being preferred for its greater affinity for tin. In soldering tin plates together, their edges are made to overlap; but in almost every other case the edges to be joined are made only to meet, the solder being run between their abutting edges.

The 'Technical Repository' (vol. iv., p. 57) gives an account of a curious mode of soldering resorted to in order to fix upon the back of the dial-plate of a watch the small copper studs by which it is attached to the plate which encloses the wheel-work. The heat required for melting spelter solder would be injurious to the enamel, and therefore the studs are made of wire plated with silver, and fixed by melting the silver on their sides, and causing it to run down to their base, where borax and water is previously laid. Thus the studs are fixed without applying the jet of the blowpipe immediately to the back of the enamelled plate.

A kind of soldering, called *burning-to*, has been long practised in some cases with sheet-lead, where it has been desirable to make a vessel entirely of that material; the junction being effected by pouring melted lead on to the edges to be united, until they fuse together. Somewhat similar to this is the process recently introduced under the name of *autogenous soldering*. This process, which is the invention of a French gentleman, M. de Richemont, consists in the union of two pieces of metal without the interposition of any solder, by fusing them at the point of junction by jets of flame from a gas blowpipe. The apparatus used for the purpose contains a hydrogen gas generator, bellows for atmospheric air, and valves for regulating the proportion in which the gas and air are to be mixed. A complete description, with cuts, of this machine, is given in the 'Mechanic's Magazine' (vol. xxxii., p. 546). The invention has been rewarded in Paris by a gold medal, at the National Exhibition of Arts, and is patented in this country. It has hitherto been applied chiefly to lead, but appears suitable for metals more difficult of fusion. By its adoption lead may be applied very extensively in chemical vessels, in which the use of solder has been inconvenient or impossible, owing to its degree of expansibility differing from that of lead, and its greater liability to be acted upon by acids. The joints formed in this way are also much neater and less liable to flaws than those made by the common process. It appears by the paper referred to at the commencement of this article, that Mr. Spencer discovered this process about the same time as M. de Richemont; and his experiments lead him to suppose that, by varying the admixture of gases, a jet of flame may be produced of intensity suitable for any metal to which it may be desired to apply the new mode of soldering.

SOLDIER is a term applied now to every man employed in the military service of a prince or state, but it was at first given to such persons only as were expressly engaged for pay, to follow some chief in his warlike expeditions.

Cæsar mentions a band of 600 men called 'soldurii,' who bound themselves to attend their leader in action and to live or die with him ('De Bello Gallico,' iii. 22), but it does not appear that they served for pay. By some the word has been thought to come from 'solidus,' the name of a coin under the Roman empire, which may have been received as the payment for the service.

The troops which formed the armies of the Crusaders were engaged to serve for pay, for though the nobles voluntarily entered into the war, their vassals were not obliged by the tenure of their fiefs to accompany them. Père Daniel ('Hist. de la Milice Fr.,' tom. i., p. 138) expresses his belief that Philip Augustus, near the end of the twelfth century, was the first of the French kings who had hired troops, at least in any considerable body, in his service; and the practice of retaining such troops appears to have been afterwards very general. It is probable that men hired for the wars were, from the time of that prince, called soudoyers or soudiers, that is, stipendiaries; but the name appears for the first time in the 'Chronicles' of Froissart, where it is applied to the hired troops both of France and Germany. It is stated that Jacques Dartevelt (van Artaveld) of Ghent (1338) kept a guard of 60 or 80 soudoyers, each of whom was paid two Flemish groats daily (liv. i., c. 29). About the same time Philip de Valois, in revenge for an inroad which had been made into his country, gave leave to the soudoyers of France to plunder the lands of Sir John of Hainault (liv. i., c. 44); and the name occurs in many other parts of the work. This class of troops at that time engaged themselves to fight for any party which would employ and pay them; and when not occupied in the wars, they used to wander about the country in large bodies, plundering the people and committing every atrocity. The terms 'routiers' and 'brigands,' as words of reproach, were applied to them, and they appear to have been as formidable to those who hired them as to the enemy. In the reign of Charles V. of France, Bertrand du Guesclin led them into Spain to serve against Peter the Cruel, and in that country great numbers of them remained, yet the disorders which they caused in France did not terminate till Charles VII., in 1445, and Louis XI., in 1480, established a regular militia, which was paid by the state.

In the wardrobe account of Edward I. (1300) the term soldier occurs frequently, and Grose considers that the persons so designated were of a different class from the other troops. Some of them are called 'soldiers esquires,' or esquires; some, 'soldiers constables;' and others, simply 'soldiers;' but the pay of all was the same, viz. one shilling per day. ('Mil. Antiq.,' vol. i., p. 323.) From the time of Edward I. to the end of the reign of Edward III. the daily pay of a banneret was 4s., and of a knight, 2s.; that of a hobiler, a sort of light horseman, was 6d.; of a crossbowman, 4d.; and of an archer, 3d. In that age the stipendiary troops, or soldiers, were raised in England by commissions granted by the king to persons who undertook to enlist men for a certain pay (which was made to depend on the nature of the service), and for a certain portion of the ransom-money which might be obtained in the war.

Little change seems to have taken place in the pay of the English soldiers between the times of Edward III. and Mary. We find that during the reign of this queen the daily pay of a captain of heavy cavalry was 10s., and of a heavy soldier 1s. 6d. The pay of a captain of light cavalry was 6s., and of a soldier 1s. The pay of a captain of foot was 4s., of a lieutenant 2s., of an ensign 1s., and of a foot-soldier 8d.; a halberdier and a hackbutter, on horseback, had each, 1s. daily. In the times of Elizabeth, James I., and Charles I., the pay of the officers was a little raised, but that of a private foot-soldier was still 8d. per day: during the civil wars the pay of the latter was 9d., but in the reign of William III. it was again reduced to 8d. At that time the pay of a private trooper was 2s. 6d., and that of a private dragoon was 1s. 6d., including in both cases the allowance for the horse. It is evident that the pay of the private soldier in later times is far from having been raised in the inverse ratio of the value of money.

While armour was in general use, the common soldiers of England were distinguished only by scarfs or by badges, on the latter of which were impressed the arms of their several leaders; but in the reign of Henry VIII. something like a uniform was worn, and it appears that the colour of the men's upper garments was then generally white; the soldiers in the king's particular service only, had on their coats a representation of the cross of St. George. However, on an army being raised in 1544, the soldiers were ordered to wear coats of blue cloth bordered with red. White cloaks marked with red crosses continued to be the uniform of the troops during the reign of Queen Mary; but in the time of Elizabeth the infantry soldiers wore a cassock and long trousers, both of which were of Kendal green; the cavalry were furnished with red cloaks reaching down to the knee and without sleeves. Grey coats, with breeches of the same colour, continued to be the uniform as late as the end of the reign of William III., but soon after that time red became the general colour for the coats of the British infantry soldiers.

The low condition of the first soldiers in France has been mentioned in the article INFANTRY: with respect to those of England in the times of Henry VIII. and Edward VI., we have a more favourable account; for Sir John Smythe, in the preface to his tract on 'Military Instruction' (1591), observes that the order and discipline in the armies during the reigns of those kings were so good, that the men, on being discharged, were never seen to become rogues or to go begging under pretence that they had been soldiers, as, he observes, they now most commonly do. In the preface to his 'Discourses on the Forms and Effects of Weapons' (1590), he complains that, in his time, the commanders of troops serving abroad, instead of publishing regulations for the conduct of the men, gave a few laws artfully tending to deter the soldiers from demanding their pay, but in no way prohibiting them from plundering the people of the country: he adds that they esteemed those soldiers to be the best who, by robbery, could live longest without pay. He complains also that while the commanders were gallant in appearance, and had their purses full of gold, the soldiers were without armour, ragged, and famished; and that when money was to be received, they used to send the men on desperate enterprizes, in order that they might obtain the pay of those who were killed. He adds that, in the summer before the earl of Leicester went over (to Holland) the commanders devised a manner of paying the soldiers which had never before been heard of; instead of money, the men were paid in provand, under pretence that they knew not how to make purchases; by which means, the food supplied being of an inferior kind, great part of the soldiers' pay was put in their own pockets. It appears that Queen Elizabeth, on being informed of these abuses, caused the practice of paying in provand to be abolished. We find that subsequently, even so late as the time of George I., the pay both of officers and private soldiers was frequently postponed for years, and was sometimes entirely withheld. Happily such injustice no longer exists in the British army: the pay of the soldier is secured to him by the nation; and a well-appointed commissariat provides, as far as possible, for his wants while in the field.

It must be admitted that, till lately, the condition of a private soldier, both in this country and on the Continent, was unfavourable for inspiring a love of the service in his mind. Obliged to be furnished with good clothing and to preserve a becoming appearance, that which remained of his scanty pay scarcely sufficed for procuring the food necessary for his support. In his barracks he was subject to numerous petty details of duty, which produced weariness and even disgust; and, at all times, to the restraints of discipline, which deprived him of the recreations enjoyed by other classes of men. It may be added, moreover, that the soldier had too often the mortification to find himself despised for his poverty by persons with whom men of his condition are accustomed to associate. These disadvantages are now however in a great measure removed; and the pay of the soldier suffices to afford him the means of obtaining the comforts of life in a degree, at least, equal to those which are enjoyed by an ordinary peasant or mechanic. With the improvement of his condition, a corresponding improvement in the character of the soldiers has taken place: men of steady habits are induced to enlist, and officers are enabled to select the best among those persons who present themselves as recruits for the army.

The duties of the soldier are now rendered as little burthensome as is consistent with the good of the service; and the regulations, promulgated by the highest authorities, prescribe that he shall at all times be treated with mildness and humanity: even the non-commissioned officers are required to use patience and forbearance in instructing the recruits in their military exercises. When breaches of discipline on the part of the soldier oblige a commander to order the infliction of punishment, attention is paid as much as possible to render it a means of promoting a reformation of character: the lash is now very sparingly used. Wherever a regiment be now quartered, there is established for the soldiers a school, which the men are obliged, as part of their duty, to attend, and which is generally furnished with a library for their use. The library and school are formed and supported by the subscriptions of the officers, and both have been found to contribute greatly to the preservation of sobriety and good conduct among the men, by weaning them from the haunts of idleness and dissipation, and giving them a taste for useful knowledge.

In time of peace the soldier, being surrounded by the members of civil society, must, like them, conform to its laws; and, being under the influence of public opinion, he is, unconsciously to himself, held in obedience by them; so that no extraordinary coertion is necessary to keep him within the bounds of civil or military law. But in the colonies the soldier, even though he be serving in a time of peace, has many temptations to fall into a neglect or breach of discipline: he is far removed from the friends of his early life, who may have exercised upon his mind a moral influence for good: he sees around him only the conduct, too frequently licentious, of the lower orders of people in the country where he is stationed; and it may be that he is not fortified with the principles which should have been implanted in his mind by a sound education. The probability of a return to his native land before many years have passed is small, and the diseases to which he is exposed from the unhealthiness of the climate frequently terminate fatally: hence he becomes reckless from despair, and the facilities with which wine or spirituous liquors may often be obtained lead him into excesses which, while they accelerate the ruin of his health and render him unfit for duty, cause him to commit offences both against discipline and morals. Thus in the colonies there arises a necessity for greater restraints on the freedom of the soldier, and for the infliction of heavier punishments than are required at home. (Maj.-Gen. Sir Chas. Napier, *Remarks on Military Law*.) Lastly, in time of war and on foreign service a vigorous discipline is essentially necessary: the privations to which soldiers are then exposed strongly induce those who are not thoroughly imbued with moral and religious principles to plunder the country-people, in order to supply their immediate wants, or to drown the sense of their sufferings in liquor. It ought also to be observed that, in war-time, many turbulent spirits are induced to enter the army in the hope of enjoying the licence which the military life abroad appears to hold out. These men are the ring-leaders in all excesses, and they too commonly cause many of those who are weak in principle to join them; in such cases therefore the most severe coercive measures must be immediately applied, if discipline is to be preserved in the army. The efforts made by the British commanders, during the war against the French in Spain, to maintain order, and prevent the people of the country from being injured, were great and praiseworthy; and perhaps fewer crimes were committed by the British troops than by those of their allies or their enemies; but it is to be lamented that there were still too many occasions in which the national character was disgraced by the misconduct of its soldiery.

SOLE. [PLEURONECTIDÆ.]

SOLECISM (*soloecismus*, *σολοικισμός*), a grammatical term which is used by the later Greek and Roman writers, and by modern grammarians also, though in a somewhat different sense. It is defined by Sinnius Capito (Gell., v. 20) as an unequal and improper arrangement of the parts of speech, that is, as a violation of the rules of syntax. Quinctilian (i., s. 28, &c.) specifies four kinds of solecisms: the first consists in the addition of a superfluous word; the second, in leaving out one that is necessary; the third, in perverting the order of the words of a sentence; and the fourth, in using an improper form of a word. The antients also used the word in a wider sense, understanding by it any kind of fault, error, or mistake, whether made in speaking, writing, or acting. Modern grammarians designate by solecism any word or expression which does not agree with the established usage of writing or speaking. But as customs change, that which at one time is considered a solecism, may at another be regarded as correct language. A solecism therefore differs from a barbarism, inasmuch as the latter consists in the use of a word or expression which is altogether contrary to the spirit of the language, and can properly speaking, never become established as correct language.

The term solecism was supposed by antient grammarians to be derived from Soli, a town of Cilicia, where the language of the original Greek settlers, who were few in numbers, became corrupt through the influence of the people by whom they were surrounded.

SOLEN. [PYLORIDIANS, vol. xix., p. 145, *et seq.*]

SOLENA'CEA, Lamarck's name for a family of bivalve testaceous mollusks, including the genera *Solen*, *Panopæa*, and *Glycymeris*. [PYLORIDIANS, vol. xix., pp. 145, *et seq.*]

SOLENE'LLA, Sowerby's name for a genus of testaceous bivalve mollusks apparently belonging to the family *Arcacea* of Lamarck, and partaking of the characters of the genus *Nucula* [POLYODONTA, vol. xviii., p. 363], and of the family SOLENACEA.

Generic Character.—*Shell* oval, equivalve, sub-equilateral, compressed, covered with a thin shining olive-green epidermis. *Hinge* with many teeth, three or four of which are anterior, and the numerous rest sharp, posterior, lateral, and arranged in a straight line. Two lateral *muscular impressions*. The *pallial impression* with a large sinus. *Ligament* external, prominent, and elongated.

Example, *Solenella Norrisii*. A few specimens of this, the only known species, were dredged up by Mr. Cuming at Valparaiso.

SOLENIMY'A, or SOLEMY'A. [PYLORIDIANS, vol. xix., p. 146.]

SOLENOCURTUS, or SOLECURTUS. [PYLORIDIANS, vol. xix., p. 144.]

SOLE'NODON, a genus of insectivorous mammals established by Brandt on a specimen sent from the island of Hispaniola by Jaeger.

Generic Character.—Habit generally between that of *Sorex* and *Didelphys*. Muzzle elongated, the snout smooth, produced, and with nostrils at the sides of its apex. Eyes minute. Ears large, rounded, nearly naked. Body hairy. Stern and upper part of the rump beset with a few very short silky hairs. Feet ambulatory, plantigrade, pentadactylous; claws falcular, those of the fore feet the longest. Teats inguinal? Tail long, smooth, and for the most part scaly.

Dental Formula —Incisors, $\frac{6}{6}$; molars (spurious $\frac{6}{6}$, true $\frac{8}{8}$) = 40.

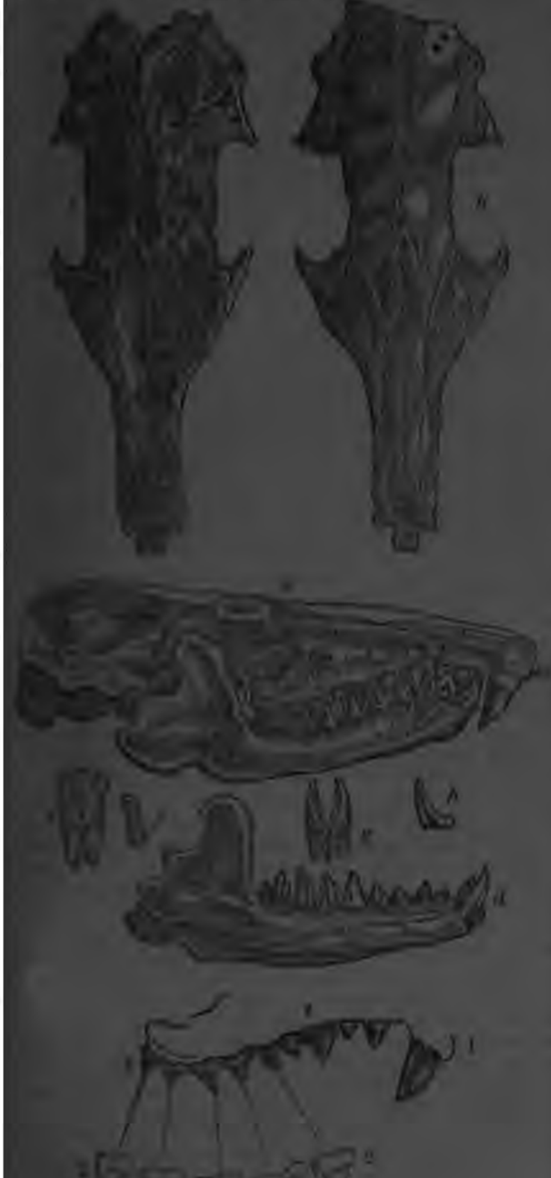
The skull of *Solenodon* is considerably elongated: the occipital, parietal, and temporal bones are moderately convex; and the condyles of the occipital are prominent. There is an obtuse crest on the sagittal suture, but none on the coalesced frontal bones. The internal pterygoïd processes alone are conspicuous, thin, and joined by a suture with the perpendicular parts of the palatal bone. There is no bony *bulla*, and, consequently, the interior wall of the tympanic cavity is only closed by skin. There is no zygomatic arch. The coronoïd process of the mandible is dilated and directed outwards. The angle of the mandible is dilated, subtetragonally rounded, and prominent above the condyloïd part.

The two anterior upper incisor teeth are the largest, disjoined from the others, perpendicular, and unicuspid: the two anterior lower incisors are very short and very narrow; the two middle are the longest, and conical, and excavated on the internal surface with a rather deep triangular canal. Brandt remarks that the structure of the teeth manifests a greater similitude to that of *Myogale* (Mygale) than any other genus.

Example, *Solenodon paradoxus*.

Description.—Sides of the head and neck dilute yellow-brown, mixed with ferruginous, and, occasionally, with grey. Abdomen and feet dilute yellow-brown, with hairs of a mixture of grey. Space upon the breast between the anterior limbs dilute ferruginous, extended to the internal side of the feet, and, anteriorly, to the cubit. A similarly coloured space occupies the inguinal region, and also extends upon the anterior part of the legs. Upper part (dorsum) of the muzzle, forehead, vertex, middle of the nape, and anterior part of the back, tinged with black-brown: the rest of the back black-brown, the colour (more diluted) extending towards the posterior part of the sides and towards the ex-

[illegible] of the thighs. The basal and middle part [illegible]; the apical part white.



[illegible]

Feet of Solenodon. (Brandt.)

a, [illegible] part of the anterior foot, seen on the dorsal or upper side; b, [illegible] of the anterior part of the posterior foot.

Habits, &c.—Brandt remarks that nothing is known of the mode of life of this animal; but from the structure of its [illegible] and claws, he concludes that it must burrow. The form of the [illegible] of the [illegible] [illegible] developed organ of smell.

The true place of this animal is, most probably, among the [illegible].

Solenodon paradoxus. (Brandt.) ([illegible] of the Imperial Academy of [illegible] at St. Petersburg, [illegible].)

SOLID, SOLIDITY. (Mechanics.) A solid body is one which is composed of matter so connected together that the relative positions of its parts cannot be altered without the application of sensible force. The force which resists the alteration of the relative positions is called force of Cohesion; the perfect absence of this force constitutes fluidity. [Fluid.]

SOLID ANGLE, a name given to the idea of opening conveyed by three planes which meet at a point. The properties of a solid angle are considered under the head Spherical Triangle.

SOLID, SURFACE, LINE, POINT. (Geometry.) We have thought it best to bring together the remarks which it is necessary to make upon these fundamental terms of geometry. According to Euclid, a point has no dimensions; a line, length only; a surface, length and breadth; a solid, length, breadth, and thickness. No one has the least doubt about each of these terms conveying a clear and distinct notion; in spite of this however, the propriety of the definitions has been made matter of much discussion.

Space being distinctly conceived, parts of space become perfectly intelligible. Hence arises the notion of a boundary separating one part of space from the rest. That a material object, a desk or an inkstand, occupies a certain portion of space, separated by a boundary from all that is external, needs no explanation: this boundary is called surface, and possesses none of the solidity either of the desk or inkstand, or of the external space. Surface itself, when distinctly understood, is capable of division into parts, and the boundary which separates two parts of a surface has none of the surface, either on one side or the other: it therefore presents length only in the imagination. Again, length itself is capable of division into parts; the boundaries do not possess any portion of length, either on one side or the other: they are only partition marks or points. Euclid reverses the order of our explanation, requiring first the conception of a point, then of a line, then of a surface, then of a solid.

That when we think of a point, we deny length, breadth, and thickness; that when we think of a line, it is length without breadth that we figure to ourselves; that in the same manner the surface of our thoughts possesses no thickness whatever—are, to us at least, real truths. We cannot, for instance, imagine what Dr. Beddoes meant when he said (*Obs. on Demonstrative Evidence*, p. 30), 'Draw your lines as narrow as you conveniently can, your diagrams will be the clearer; but you cannot, and you need not, conceive length without breadth.' *Why* are diagrams the clearer, the narrower the lines of which they consist? Diagrams have no clearness in themselves, the comprehension of them is in the mind of the observer. If diagrams having (so called) lines of one-hundredth of an inch in breadth be clearer than others of five-hundredths of an inch, it is because the former approach nearer than the latter to a true representation of that which is in the mind, or of that which the mind desires to see portrayed. If the smaller the breadth the better the diagram in the clearness which it gives to the mind, it must be because the mind would have no breadth at all.

It matters nothing that the point, line, and surface are mechanical impossibilities, that no point or line, if they actually existed, could reflect light to show them, and that no surface could continue to exist for any perceptible time, even supposing it to have one moment of existence. Neither does it signify whether the ideas are necessary, or acquired from the senses; the question in geometry is, Have you got them? not, How did they come? There may be danger that some students should need at first to be frequently reminded of the abstract limits of which the conceptions must be made permanent, lest they should accustom themselves to rest in the imperfect approaches to these conceptions which are realised in their diagrams; but it is always found that a moment's recollection will produce a satisfactory answer to any question upon this point.

There is, it is true, one circumstance in which the pupil may acquire a permanently false notion of the object of geometry. If an instructor should require what is called a very well drawn figure in every case, with very thin *lines* and very small *points*, he may perhaps succeed in giving the learner some idea that geometry consists in that approach to accuracy which constitutes practical excellence in the applications of the science. No idea can be more false: let the good line be examined under a microscope, and it is seen to be a solid mound of black lead or ink, as the case may be. Hence it is perhaps desirable that the demonstrations should be frequently conducted with what are called ill-drawn figures, in order that no reliance may be placed on the diagram, further than as serving to remind the student of the ideal conception which is the real object of his demonstration. This of course is recommended without prejudice to his learning the accurate use of the ruler and compasses for another distinct purpose, namely, the intention of producing *avowedly* approximate practical results.

It is to be noted that these definitions, so called, are in Euclid more than definitions. They appeal to conceptions supposed to exist, in words which are considered sufficient not to give, but to recal, the necessary ideas. This they actually do, to the satisfaction of the learner, who would never dream of their containing anything dubious, if it were not for the ill-advised interference of the metaphysician. Whatever of pleasure or profit there may be in the subsequent union of the sciences, there is, we think, no doubt that the young geometer should not be required to take lessons of the ontologist.

SOLID, SUPERFICIAL, AND LINEAR DIMENSIONS. A solid, a surface, and a line, when they come to be the objects of arithmetic, are things as distinct as a weight and a time. That a surface is included by lines, or a solid by surfaces, makes no more of necessary connection between them than exists between weight and time, because the former can never be made sensible without the latter. Length only can measure length, a surface only a surface, a solid only a solid. Reasons of arithmetical convenience, not of necessity, make it adviseable that whatever length may be chosen to measure length, the Square on that length should be the surface by which surface is measured, and the Cube on that length the solid by which solidity is measured. Unfortunately, if a foot be the measure of length, the square on a foot and the cube on a foot have no other names than *square foot* and *cubic foot*. The farmer with his acres, and the distiller with his gallons, have an advantage which is denied to the young mathematician. Ask the first how many acres make a gallon, and the second how many gallons make an acre, and both would laugh at the question; the third is allowed an indistinct conception of measuring surfaces and solids in feet or inches, as if they were lines, from the occurrence of the same word in all his measures.

Length is said to be a quantity of one dimension, surface of two, and solidity of three. The right line, the right surface or Rectangle, and the right solid or rectangular Parallelopiped (the figure of a box, a die, a plank, a beam, &c.), are the implements of mensuration. Every surface must be reduced to the second form, and every solid to the third, before it can be measured. The rules (which tacitly contain these reductions) for measuring different superficial or solid figures will be found under the several heads: the two fundamental theorems by which measurement becomes practicable, are as follows:—

1. The numbers of linear units in the two sides of a rectangle, being multiplied together, give the number of superficial units, square units, or squares on the linear unit which the rectangle contains. Thus a rectangle of 2½ by 4⅓ feet contains $\frac{5}{2} \times \frac{13}{3}$, or $\frac{65}{6}$, or 10⅚ *square* feet.

2. The numbers of linear units in the length, breadth, and thickness of a right solid, being multiplied together, give the number of solid units, cubic units, or cubes on the linear unit, which the right solid contains. Thus a plank of 2¼ inches broad, 1½ inch thick, and 10⅓ inches long, contains $\frac{9}{4} \times \frac{3}{2} \times \frac{31}{3}$, or $\frac{279}{8}$, or 34⅞ *cubic* inches.

SOLIDS, REGULAR. [Regular Figures, &c.]

SOLIMAN, EBN ABD-AL-MALEK, the seventh caliph of the race of the Ommiyades, succeeded his elder brother Walid I., A.D. 715 (A.H. 96). He acquired his popularity at the commencement of his reign by dismissing the various governors whom the inertness of Walid had suffered to oppress the people at their pleasure; and Koteibah, the first Moslem conqueror of Transoxiana, who also refused to acknowledge his authority, was seized and put to death by his own soldiers. Another of his lieutenants, Yezid Ebn Mohalleb, reduced the rugged and impenetrable provinces of Tabrestan and Jorjan, on the south coast of the Caspian, which had never before been completely subdued. But the principal military undertaking of his reign was the siege of Constantinople, commenced the year after his accession, by a vast fleet and army under his brother Moslemah. (Gibbon, c. 52.) But the Saracen fleet was destroyed by the Greek fire; the strength of the fortifications reduced the siege to a blockade; and the caliph was preparing to lead a second army to reinforce his brother when he died of a surfeit at Chalcis in Syria, A.D. 717 (A.H. 99), nominating in his last moments his cousin Omar Ebn Abd-al-Aziz as his successor, to the exclusion of his own sons and brothers. The reign of Soliman is said to have been the epoch of the first rise of the Barmecides, who afterwards became famous as the ministers of the Abbasides.

SOLIMAN, EBN AL-HAKEM, a Moorish chief, who in the civil wars preceding the extinction of the caliphate of the Ommiyades at Cordova, possessed himself of the capital by the aid of the African troops whom he commanded, and proclaimed himself king, A.D. 1009 (A.H. 400), under the title of Al-Mostain Billah. Though soon expelled by Mohammed, one of the Ommiyan competitors, he recovered Cordova in 1112, dethroning Hesham II., who had been replaced on the throne on the death of Mohammed: but his valour and abilities were not able to maintain him in his usurped authority: the *walis*, or governors of the African and Spanish provinces, refused obedience; and after various changes of fortune, he was overthrown and slain, A.D. 1016 (A.H. 407), by Ali Ebn Hamid, *wali* of Tangier, who was proclaimed king in his room, but speedily perished in another revolution. The first discovery of the Azores has been attributed to the reign of this prince, on the authority of a passage in the 'Geography' of Sherif-Al-Edrisi; but it is not very clear that the Azores are the islands there alluded to as discovered by some Moslem adventurers from Lisbon. D'Herbelot erroneously mentions Soliman as the nephew of Hesham II., whereas he was a stranger to the blood of the Ommiyades.

SOLIMAN EBN CUTULMISH, a Seljookian prince, who founded the first Turkish dynasty in Room, or Asia Minor. His father had perished in a revolt against Alp-Arslan, the great Seljookian sultan of Persia; and Malek-Shah, the son of Alp-Arslan, was glad to rid himself of the turbulent ambition of Soliman by furnishing him with an army for the conquest of the West, A.D. 1074 (A.H. 467). The internal dissensions of the Greeks facilitated his progress. In a few years he had subdued nearly all Asia Minor except the districts on the western coast and the isolated city of Trebizond; his capital was fixed at Nicæa, within 100 miles of Constantinople, and his Turkoman followers spread themselves all over the country, which was thenceforward permanently lost to Christendom. Antioch (which had been held by the Greeks since its capture by John Zimisces in 968) was betrayed to him (1084) by the son of the governor; but this acquisition brought on a rupture between Soliman and Moslem-Ebn-Koreish, prince of Aleppo ss when the Greeks had paid a tribute for Antioch, which [illegible] refused to continue. Moslem was defeated and killed, yet in attempting to pursue his advantage and [illegible] Aleppo, Soliman was opposed and overthrown by Tutush, viceroy of Syria for his brother Malek Shah (whose vassal Moslem had been), and either fell in the [illegible], or, as some say, perished by his own hand, A.D. 1085 (A.H. 478). His sons were however restored by Malek Shah to the kingdom of Roum, where one of them, Kilidj-Arslan, was reigning at the appearance of the first Crusaders, who [illegible] will [illegible] Soliman.

SOLIMAN (often mentioned with the surname of Tchelebi, 'gentle or noble,' which is however the general title of the sons of the Ottoman sultans) was the eldest surviving son of Bayazid I. After the fatal battle of Angora, in which his father was defeated and made prisoner by Timour, A.D. 1402 (A.H. 804), he effected his escape to Europe with the vizir Ali Pasha, and reigned several years in tranquillity at Adrianople, while the fragments of Asia Minor were disputed by his three brothers. He was frustrated however in his attempt to possess himself of the Asiatic provinces (1406) by an insurrection excited against him at home by his brother Mousa, which recalled him to Europe. Mousa was defeated, and fled into Wallachia; but he returned in 1410 with a fresh army, and Soliman, surprised in Adrianople, was slain in his flight. Mousa was himself dethroned three years after by Mohammed I., under whom the Ottoman empire was reunited.

Soliman is not generally included in the list of the Turkish sultans, the interval between the death of Bayazid and the re-establishment of Mohammed being regarded as an interregnum. He was a brave and generous prince, and the first of the line of Othman who patronised literature; but his good qualities were obscured by his excessive indolence and indulgence in wine.

SOLIMAN (surnamed by the Turks *Kanouni*, or 'the Legislator,' and by European writers 'the Magnificent'), the tenth and greatest of the Ottoman sultans, succeeded his father Selim I., A.D. 1520 (A.H. 926), in the twenty-seventh year of his age; and as he was an only son, his accession was not disturbed, like those of his father and grandfather, by civil wars. His first exploit was an invasion of Hungary (1521), in which he captured Belgrade, the key of that kingdom, a conquest often attempted in vain by his predecessors; and in the following year Rhodes, which had defied the efforts of Mohammed II., was surrendered to him after an arduous siege by the knights of St. John. The suppression of a rebellion in Egypt, and of a revolt of the Janissaries (as a counterpoise to whom the corps of Bostanjis was instituted), occupied the next three years; but in 1526 Hungary was again invaded; the king, Louis II., and nearly all his army, slain in the fatal battle of Mohacz, and the whole kingdom overrun by the Turks. The Hungarian crown was conferred by Soliman on John Zapolya, [illegible] as a vassal of the Porte; but the rival pretensions of Ferdinand of Austria kindled the first of the long wars between the sultans and the German emperors; and in 1529 Vienna was besieged without success by Soliman in person. A war with Persia followed, in which Armenia and Irak, with the cities of Tabreez and Bagdad (1534), were subdued by the Ottomans; while Yemen and the Arabian coast were subjugated by the pasha of Egypt, and armaments sent even into Guzerat to aid the Indian Moslems against the Portuguese; the fleets of the vassal states of Barbary, under the famous corsair Khaireddin, or Barbarossa, at the same time swept the Mediterranean and ravaged the Italian coasts; and Croatia was conquered (1537) after a great victory over the Imperialists at Essek. The Turkish arms were everywhere triumphant, and the powerful friendship of Soliman was courted by Francis I. of France, the alliance with whom (1536) was the first between the Porte and any Christian power. The death of John Zapolya (1540) wrought a fresh change in the affairs of Hungary, great part of which was seized by the Turks, and became the seat of a pashalic; and the war continued, generally to the advantage of the Sultan, till a truce was concluded in 1547, by which Austria agreed to pay a tribute [illegible] for her remaining possessions in Hungary. In the same year a fresh invasion of Persia led to the capture of [illegible]; but this conquest was not long retained. The war with the house of Austria for Hungary again broke out (1551); and Transylvania was subdued and made a [illegible], under the protection of the Porte. Persia was again invaded, and Erivan taken in 1553; but a peace was concluded with the Shah in the following year, which became the basis of all subsequent treaties between the two powers.

A great naval victory was gained in 1560 over the combined fleets of the Christian powers at Djerbeh, on the African coast, by Piali, who had succeeded, on the death of Barbarossa, to the command of the Turkish navy; and a fresh truce with the empire (1562) left the Turks in possession of their Hungarian conquests. But the martial glories of Soliman were clouded by domestic dissensions. His eldest son, Mustapha, had been put to death in 1553, at the instigation of his stepmother Roxalana, who was anxious to secure the succession for one of her own children; and jealousies of the two surviving princes, Selim and Bayazid, having ended in the rebellion of the latter, he was defeated and driven into Persia; but the Shah surrendered the fugitive on the demand of Soliman, and he was put to death with his children (1561).

The united fleets of the Porte and of Barbary had ruled the Mediterranean since the battle of Djerbeh; but they were repulsed with great loss in the siege of Malta (1565) by the heroism of the grand-master John de la Valette. The war in Hungary meantime continued, notwithstanding frequent partial pacifications; and in 1566 Soliman headed his armies for the last time for its invasion; but he died in his tent before the walls of Sigeth, September 5, 1566 (Safar 20th, A.H. 974), the day before the capture of the town, at the age of 72 solar (or 74 lunar) years. His only surviving son, Selim II., succeeded him.

Though the Ottoman empire did not fully attain its greatest territorial extent during the reign of Soliman, its military power was undoubtedly during this period at its greatest height and most complete organization, and declined irrecoverably in both these respects under his indolent and voluptuous successors. The personal energy of the Sultan himself, and of the ministers and generals selected by him and trained under his eye, maintained the efficiency of every branch of the administration; and the Kanoun-Nameh, or code of regulations, which was drawn up under his own superintendence, completed the reform which his exertions had commenced. The finances, the military fiefs, the functions of the pashas and other employés, the police and administration of justice, are all treated at length in this elaborate compilation, which long formed the basis of both the jurisprudence and political science of the Ottomans. But Soliman was not less distinguished as a patron of literature and the arts than as a warrior and a legislator; the erection of the noble mosque of the Solimaneyeh, and of numerous public buildings both in the capital and the provinces, attest his architectural magnificence; and he is the only one of the Ottoman sovereigns who facilitated the internal communications of his dominions by the construction of roads and bridges. He was himself a poet of no mean rank; and the encouragement which he afforded to the employment of the Turkish language in place of the Persian, which the Ottomans had generally chosen as the vehicle of their sentiments, forms an era in the literature of the country. In an age remarkable for the eminent greatness of the monarchs filling the thrones of Europe, few of them equalled Soliman the Magnificent either in the union of princely qualities or in the glory and good fortune of their reigns.

SOLIMAN II., a younger son of Sultan Ibrahim, was placed on the Ottoman throne A.D. 1687 (A.H. 1099), on the deposition of his elder brother, Mohammed IV. He was nearly forty-six years of age at his accession, and had passed his whole life secluded in the seraglio and occupied by the study of the Koran. A prince thus unacquainted with active life was little fitted to stay the progress of the Imperialists, who in the last years of the preceding reign had almost expelled the Turks from Hungary. In the campaign of 1688 Belgrade and Agria were lost; and in 1689 the vizir Ragib was twice signally defeated by the Austrians, who penetrated into the heart of Servia and took Nissa. An abortive negotiation for peace followed; but the appointment of Mustapha-Pasha Kuprili to the vizirat changed the face of affairs; and in the two succeeding campaigns the Ottomans recovered Belgrade and most of the frontier fortresses. Soliman however died at Constantinople in June, 1691 (A.H. 1102), after a reign of three years and nine months; and leaving no children, was succeeded by his next brother, Ahmed II.

SOLI'NUS, CAIUS JU'LIUS, a Roman writer of whose life and period nothing is known. It is however certain that he did not write in the Augustan age, as some have supposed, for his work, entitled 'Polyhistor,' is merely a compilation from Pliny's 'Natural History.' Indeed Salmasius says (*Prolegomena*) that the work contains nothing which is not found in Pliny, and that he got together all that he could out of Pliny's work, and put it in his compendium, keeping the same arrangement and nearly the same words. Solinus however never mentions Pliny, though he cites near one hundred authors. Salmasius endeavours to show that he lived about two hundred years after Pliny. The first writers who mention him are Hieronymus and Priscian. It has often been said, and even in very recent works, that the researches of Salmasius prove that there were two editions of the 'Polyhistor.' But we certainly do not need the testimony of Salmasius to this point, as it is correctly observed in the article 'Solinus' (*Biog. Univ.*); for Solinus, in his address to his friend Adventus (according to some readings) says that the first edition was a hasty performance, and that it appeared under the title of 'Collectanea Rerum Memorabilium;' and that he gave the name of 'Polyhistor' to his second and improved edition. The work of Solinus contains a great variety of miscellaneous matter, of which a large part is geographical. His style deserves no great commendation, but it is sufficiently perspicuous. Some fragments of a poem entitled 'Pontica' have been attributed to him, but it has recently been attempted to be shown that this poem is the work of Varro Atacinus.

The first edition of Solinus is probably that of Rome about 1473; but one also appeared about the same date at Milan, edited by Bonini Mombriti. The pains that have been taken with a work of little value are shown by the number of editions. The principal edition is that of Salmasius, 2 vols. fol., Paris, 1629; and 2 vols. fol., Utrecht, 1689; a work, says Morhofius (*Polyhistor*, ii., c. 2), accompanied with a most enormous commentary, in which the editor has collected all that he could find in the antient writers on the topics which Solinus discusses, and has given also his own opinions; but the editor, as usual, did his work in a hurry, and made various blunders, which a little more attention might have prevented.

There is an English translation of Solinus, by Arthur Golding, London, 1587 and 1590. The title of the former edition is, 'The Excellent and Pleasant Worke of Julius Ca. Solinus, Polyhistor, containing the Noble Actions of Human Creatures, &c.'

SOLIPE'DES, Cuvier's name for his third family of PACHYDERMATA, which have only one apparent toe and a single hoof on each foot, although under the skin these quadrupeds have on each side of their metacarpus and metatarsus *stylets* which represent two lateral toes. The genus *Equus* of Linnæus is the only recent form belonging to this family known. [HORSE.] The extinct HIPPOTHERIUM may find a place under it.

SOLI'S, JUAN DIAZ DE, a Spanish navigator, was born at Lebrixa, the antient Nebrissa, in the province of Seville. In 1506 he sailed, in company with the celebrated pilot Vicente Yañez Pinzon, on an expedition, the object of which was to endeavour to find the strait or passage supposed by Columbus to lead from the Atlantic to a southern ocean. As no such passage exists, this of course proved unsuccessful, as did also another voyage which was undertaken by them for the same purpose in 1508. They however explored the northern coast of South America, and are supposed to have discovered Yucatan. On their return to Spain, Solis and Pinzon were appointed royal pilots, and again entrusted with the command of an expedition for the discovery of new lands. This time they doubled Cape St. Augustine, and sailing southwards along the coast, reached the 40° of S. lat. However, on their return to Seville in 1509, the court was so much displeased with the unprofitable result of the expedition, that they were both deprived of their offices and emoluments, and Solis was put in prison. In 1512 Solis applied for and obtained permission to sail on a voyage of discovery; but as the government would not grant him any assistance, he was obliged to raise among his friends the funds required for the expedition. After touching at Teneriffe, he surveyed Cape St. Roque, then Cape St. Augustine; continuing his route to the South, he discovered Cape Frio, and entered the Bay of Rio Janeiro. Thinking this to be the strait in search of which he had sailed, Solis took possession of the northern coast in the name of the king of Castile, and gave the name of M Fresca (Fresh sea) to that portion of the Atlantic which before him. Proceeding farther along the coast, he several Indians, who told him of a river called Paraguay, *i.e.* great water, on the banks of which gold was said to found in large quantities. Satisfied with this information Solis returned to Spain, and having obtained the requisite leave to undertake the conquest of the lands watered by the river, he sailed on the 8th of October, 1515, with three caravels, having seventy soldiers on board. On his arrival at Rio Janeiro, Solis left two of his ships behind, and sailed with the third in a south-western direction in search of the Indians with whom he had conversed on his first voyage. He found them; but scarcely had he landed with the greater part of his crew, when they were surrounded and put to death by the Indians. This catastrophe happened near a small river between Maldonado and Montevideo, which to this day is called 'El Rio de Solis.'

SOLI'S, ANTONIO DE, was born at Placenzia, J 18, 1610, of an antient and illustrious family. His parents sent him to Salamanca to study the law; but having a natural turn for poetry, he gave it the preference, and cultivated the muses with great ardour and success. At the age of seventeen, and when still a student, he wrote a comedy called 'Amor y Obligacion' (Love and Duty), which was received with the highest applause. This introduced him to the notice of Calderon, with whom he was afterwards very intimate, occasionally writing the prel to his dramas. At six-and-twenty Solis applied himself to ethics and politics, as well as to the history and antiquities of his native country. His great merit procured him a patron in the count of Oropesa, then viceroy of Navarre, and who appointed him his secretary. Solis seems to have taken a particular delight in recording the virtues of his Ma whom he highly praises in several of his poems. On the birth of one of his sons he composed an heroic drama called 'Orpheo y Eurydice,' which was acted at Pampeluna during the festivities celebrated by the municipality on that occasion. In 1642 Solis was appointed to a lucrative office in the secretary of state's department, and subsequently raised to the honourable post of secretary to Philip IV. It was then, and in order to celebrate the birth of a son of this king, that Solis composed one of his best comedies 'Triumfos de Amor y Fortuna' (Triumphs of Love and Fortune), which met with the most brilliant success. After the death of Philip, Solis was named to the office of *cronista de las Indias*, or first historiographer of the transactions of the Spaniards in both Indies. In this capacity he wrote his 'Historia de la Conquista de Mexico,' a work which has ranked him among the best prose writers of Spain, and which was greatly esteemed at home and abroad. It contains an account of the conquest of Mexico by Hernan Cortés, written with great spirit and in very elegant style, though it is deficient in the criticism which belongs to a true historical writer. The work is considered by the Spaniards as the last relic of their classic literature. It appeared for the first time at Madrid in 1682, folio, and went subsequently through several editions, of which the principal are Barcelona, 1691, fol.; Madrid, 1777 and 1783, 4to.; Venice, 1704, 4to.; London, 1808, 2 vols. 8vo. We have an English version of it by Townsend (Lond., 1724), and there are besides French and Italian translations.

Solis is better known out of Spain as an historian than as a dramatic writer, yet he occupies a prominent place among the poets of that nation. His plays do not display so much invention as those of Calderon, but his dramas are more regular than those of that poet, because he was less liable to be led away by the force of his imagination. Among his comedies, 'El Alcazar del Secreto' (the Castle of Mystery), and 'La Gitanilla de Madrid' (the Gipsy-girl of Madrid), which is partly founded on Cervantes's novel of the same title, are justly much valued. His comedy 'Un Bobo haze Ciento' (One Fool will make a Hundred) has, with many others, been imitated by the French dramatic writers. A volume of Solis's plays and dramas, in all fourteen, appeared at Madrid in 1732, 4to. There is also a volume of Lyric Poems written by him on various subjects, 'Varias Poesias de Don Antonio de Solis,' Madrid, 1682, 4to.; and some letters published by Mayans in 1732. At the age of fifty-seven Solis entered into holy orders, and devoted himself almost exclusively to exercises of devotion. He now renounced all profane compositions, and wrote nothing but some dramatic pieces upon sacred subjects. He died April 19, 1686. He

Don Juan de Goyeneche wrote an account of his life and writings, which appeared for the first time at Brussels in 1704, with the 'History of the Conquest of Mexico,' and has been prefixed to almost every subsequent edition of the same work.

SOLITA'RIUS (the Hermit), an obsolete constellation of Lemonnier, which, having been admitted into the Astronomical Society's lists, appears here. It is situated a little above Centaurus, near the tail of Hydra. Its principal stars are as follows:—

SOLLYA, a genus of plants of the natural family of Pittosporeæ, named by Dr. Lindley in compliment to R. H. Solly, Esq., a gentleman versed in the anatomy and physiology of plants, and well known as a patron of science and art. The genus is closely allied to Pronaya and Billardiera, and the species are highly ornamental plants, which are indigenous in New Holland and Van Diemen's Land, with twining stems, oblong alternate, shining, dark-green leaves, with the flower-stalks terminal, or opposite to the leaves, and bearing bunches of bright-blue nodding flowers. *S. heterophylla* and *S. angustifolia* are two common species cultivated in our greenhouses, and were very common everywhere until the severe winter of 1837-38.

SOLMISATION, or *sol-fa-ing*, in singing, is the art of applying to the seven notes of the scale certain syllables, having no meaning in themselves, but containing the five first vowels, according to the French method, and the four first according to the system adopted by the Italians and English.

This art was practised by the Greeks; but the six syllables now in use are generally attributed to Guido d'Arezzo. [Guido d'Arezzo.] These he selected, on account of their including all the vowel sounds, from the following stanza of a monkish hymn to St. John the Baptist:—

'Ut queant laxis
Resonare fibris
Mira gestorum
Famuli tuorum,
Solve polluti
Labii reatum,
Sancte Joannes!'

In what is called the hexachord system [Hexachord], these syllables were found sufficient. When, however, that perplexing and absurd method began to be disused, the admission of a name for the seventh of the scale became necessary, and Le Maire, a French musician of the seventeenth century, has the credit of having introduced for this purpose the syllable *si*. The Italians rejected the French *ut*, and substituted the more euphonious syllable *do*, which is also adopted in England. The syllables therefore now used by the Italians and English—at least by such masters as understand and know how to value the art of Solmisation—are as follows:—

Do,	Re,	Mi,	Fa,	Sol,	La,	Si,	Do.
C,	D,	E,	F,	G,	A,	B,	C.

To these syllables the English give the Italian pronunciation.

SOLOMON (שְׁלֹמֹה, Σαλωμὼν, Σολομών), the son of David and Bathsheba, was born B.C. 1033, and was named by God, through the prophet Nathan, 'Jedidiah,' that is, 'beloved of the Lord.' (2 Sam., xii. 24, 25.) In the old age of David, his son Adonijah attempted to seize the kingdom, upon which David had Solomon proclaimed and anointed king, B.C. 1015. (1 Kings, i.; 1 Chron., xxiii.) In the same year David died after giving certain charges to Solomon. (1 Kings, ii.) The first acts of Solomon were to punish the enemies of David, and especially Adonijah and his adherents. He then contracted a close alliance with Pharaoh, king of Egypt, whose daughter he married. Being thus strengthened in his kingdom, he assembled all the congregation of Israel at Gibeon, where the Tabernacle stood, and offered burnt offerings to God. In the same night God appeared to him, and commanded him to ask what he would. Solomon asked for wisdom and knowledge, that he might judge the people. God was pleased with the request, and promised him not only the wisdom which he asked for, but also riches and long life, and power over his enemies. Solomon's wisdom was soon displayed in his decision of a singular case which came before him for trial. (1 *Kings*, iii.; 2 *Chron.*, i.)

The kingdom of Israel was now at its highest pitch of prosperity and extent. It reached from Egypt and the borders of the Philistines to the Euphrates, and southward as far as the head of the Red Sea. With the neighbouring kings of Egypt and Tyre, which city then held the supremacy of Phœnicia, Solomon was in close alliance. The people of Israel were very numerous and prosperous, and enjoyed profound peace; and the court of Solomon was maintained on a scale of the greatest splendour, which was supported by the encouragement that he gave to commerce, by which 'he made silver and gold as stones, and cedar-trees made he as the sycamore-trees that are in the vale for abundance.' The fame of his wisdom spread abroad, and people and kings came from all countries to hear it, for 'he spake three thousand proverbs, and his songs were a thousand and five. And he spake of trees, from the cedar-tree that is in Lebanon even unto the hyssop that springeth out of the wall: he spake also of beasts and of fowl, and of creeping things, and of fishes.' (1 *Kings*, iv., x.; 2 *Chron.*, ii., 13-17; ix.)

In the fourth year of Solomon's reign, having secured the co-operation of Hiram, king of Tyre, he began to build the Temple of God at Jerusalem, for which David had already formed a plan and collected treasures, but which he had not been allowed to build because he was a man of blood. (1 *Chron.*, xxii., xxviii.) In seven years (B.C. 1005) the building was finished and dedicated to God. (1 *Kings*, v.-viii.; 2 *Chron.*, ii.-vii. [Temple.] On this occasion God appeared to Solomon in a vision the second time, and promised that if he continued in piety and uprightness, his family should be established on the throne; but that if he or his children should fall into idolatry, Israel should be cut off out of their land, and both they and the Temple itself should be made a proverb and by-word among all people. (1 *Kings*, ix. 1-9; 2 *Chron.*, vii. 12-22.)

Josephus (*Antiq.*, viii. 2, 8) states that copies of the letters which passed between Solomon and Hiram concerning the building of the Temple were preserved in his day among the archives of Tyre.

Solomon adorned Jerusalem with other magnificent buildings. He built a palace for himself, which took thirteen years to complete; and another palace, which was called the House of the Forest of Lebanon, probably on account of the quantity of cedar used in it, with porticoes where he sat in judgment; and also a palace for his wife, the daughter of Pharaoh. (1 *Kings*, vii. 1-12; 2 *Chron.*, viii. 1.) He also built several cities, and among them Tadmor in the wilderness, which was afterwards called Palmyra; but the splendid ruins which still exist belong to the age of the Roman empire. (1 *Kings*, ix. 15-19; 2 *Chron.*, viii. 1-6.) In all these buildings he used as workmen the descendants of the Canaanites who remained in the land, whom also he made to pay a tribute: the Israelites he employed in his armies, and in superintending the works. (1 *Kings*, ix. 20-23; 2 *Chron.*, viii. 7-10.) He built a navy at Ezion-geber, which brought him the produce of Arabia and India. (1 *Kings*, ix. 26-28; x. 11, 12; 2 *Chron.*, viii. 17-18. [Ophir.] He had also another navy in the Mediterranean, in company with a navy of Hiram, which made a voyage to Tarshish every three years, bringing gold, silver, ivory, apes, and peacocks. (1 *Kings*, x. 22, 23; 2 *Chron.*, ix. 21.) From Egypt he imported horses and linen-yarn. (1 *Kings*, x. 28, 29.)

While Solomon was thus at the height of his prosperity, he received a visit from the queen of Sheba, or Saba, in Ethiopia, who had heard of his wisdom and came to prove it with hard questions, to which Solomon gave such answers that she confessed that the half of his wisdom had not been told her, and departed after an exchange of presents. (1 *Kings*, x.; *Matt.*, xii. 42.)

Solomon's prosperity was at length too much for him. Among his magnificent establishments was a large harem, composed, in direct opposition to the divine command, of women from the remnant idolatrous nations of Canaan. These women seduced him into idolatry, as a punishment for which God threatened to divide his kingdom after his death; and even during his life signs were given of the coming calamity in the rebellion of Hadad the Edomite, Rezon, king of Syria, and Jeroboam, the son of Nebat, who afterwards became king of the ten revolted tribes of Israel. (1 *Kings*, xi.; *Nehem.*, xiii. 26.)

It is generally supposed that this threat had the effect of recovering Solomon from his idolatry, and that he then recorded in the book of *Ecclesiastes* his confessions of the vanity of worldly wisdom, riches, and honour. This supposition is rather favoured by the internal evidence of the narrative in the book of *Kings*, and by that of the book of *Ecclesiastes* itself. Among the other works ascribed to him are the 'Book of Proverbs,' of which he must be regarded as the compiler rather than the author [PROVERBS], the SONG OF SOLOMON, the *Wisdom of Solomon* [SOLOMON, WISDOM OF], the *Psalms* lxxii. and cxxvii., and also a collection of eighteen psalms, entitled 'The Psalter of Solomon,' which was found in Greek, in the library at Augsburg, by Schott, and translated into Latin by De la Cerda, and which are generally supposed to be the composition of some Hellenistic Jew, in imitation of the Psalms of David. Other writings ascribed to Solomon are mentioned by Suidas (s. v. Ἐζεκίας), by Euseb. (*Praepar. Evang.*, ix. 31). See also Fabric., *Cod. Pseudepigraph.*, I. 914, &c.; 1014, &c.; Bartolocc., *Bibl. Rabb.*, i. 490, &c. Solomon died in the year 975 B.C., after a reign of forty years. (1 *Kings*, xi. 42, 43; 2 *Chron.*, ix. 30, 31.)

The reign of Solomon was the period of the highest prosperity of Israel and the commencement of its decline, both in its religious and civil state. At its commencement the kingdom had reached its utmost boundaries, and was in the enjoyment of profound peace and plenty, and the temple of God was built and dedicated; but before its close the king had turned idolater, rebellion had broken out, and the kingdom was on the eve of a partition. The causes of this decline are obvious. They were in part judicial, for in the magnificent establishments of Solomon, especially in his treasures, his horses and chariots, and his concubines, he had transgressed the fundamental law which defined the duties of the king. [MOSES, p. 441.] But natural causes also may easily be found. The government of Solomon was calculated rather to promote the splendour of the court than the prosperity of the people. The wealth derived from commerce went into the king's treasury, and the people were even taxed in addition. (1 *Kings*, xii. 4, 10, 11.) The court set the example of luxury, which weakened and depraved the whole nation, besides training up that race of insolent young nobles whose bad advice to Rehoboam was the immediate cause of the partition of the kingdom. (1 *Kings*, xii. 6-11.) The subject nations were of course ready, especially after forty years of peace, to throw off the yoke, and it has even been doubted whether the splendid scale on which Solomon established the Temple worship was likely to support the national religion. On the whole, therefore, this period of the history of Israel must be regarded as far less solid than splendid.

Solomon has always had an extensive fabulous reputation in the East. As early as the time of Josephus magical powers were ascribed to him (*Antiq.*, viii. 2, 5; comp. Origen, *Ad Matth.*, xxvi. 63; Nicet. Chon., *Annal.*, iv. 7). The similar traditions of the Arabians concerning him have been collected by Mr. Lane (*Thousand and One Nights*, Index, under *Suleymán Ibn Dáood*).

(Winer's *Biblisches Realwörterbuch*; Calmet's *Dictionary*.)

SOLOMON, THE WISDOM OF (Σοφία Σαλώμων), an apocryphal book of the Old Testament, ascribed to Solomon, but manifestly written long after his time. It is not known to have ever existed in Hebrew, and it contains Greek ideas and expressions which prove it to belong, if to a Jew at all, to one of the Alexandrian school. There are in it historical references utterly at variance with the state of things in Solomon's reign, and quotations from Isaiah and Jeremiah. Internal evidence would point to the end of the second or beginning of the first century B.C. as the time of its composition. It is commonly ascribed to Philo the Jew, but the style is quite different from his genuine writings. It was badly translated into Latin before the time of Jerome, who did not revise the version. The fathers of the church considered it apocryphal; but it was pronounced canonical by the third council of Carthage (A.D. 397) and again by the council of Trent.

It consists of two parts. The first part (chap. i.-ix.) contains the praise of wisdom, an exhortation to all, and especially to kings, to seek it, and the manner in which it is to be obtained. The second part (chap. x.-xix.) brings forward examples from history of the happiness that springs from wisdom and the misery entailed by folly. Throughout the book Solomon is represented as speaking; and the work is evidently an imitation of his proverbs. It is remarkable as being the earliest Jewish work extant which contains a clear statement of the doctrine of rewards and punishments in a future state.

Bishop Lowth says (*Praelec.*, xxiv.): 'The style is very unequal; it is often pompous and turgid, as well as tedious and diffuse, and abounds in epithets, directly contrary to the practice of the Hebrews; it is however sometimes temperate, poetical, and sublime. The construction is occasionally sententious, and tolerably accurate in that respect, so as to discover very plainly that the author had the old Hebrew poetry for his model, though he fell far short of its beauty and sublimity.' (The *Introductions* of Jahn and Horne.)

SOLOMON, THE SONG OF, or THE BOOK OF CANTICLES (שִׁיר הַשִּׁירִים; Ἆισμα ᾀσμάτων, 'Canticum Canticorum,' which titles mean 'The Song of Songs,' that is, 'the most beautiful song'), a canonical book of the Old Testament.

The canonical authority of this book has been much disputed. It is now admitted on all hands that it formed part of the Jewish canon. It is found in the oldest Christian catalogues of the sacred books, and in all the antient versions. The argument that it is not quoted in the New Testament is of little weight against this mass of external evidence. The same objection would apply to other parts of the Old Testament. And although the book is not actually quoted, yet the canonical writers of both Testaments employ the same imagery which is used in it to describe the connection between Christ and the church. Some critics have indeed found passages in the New Testament which they conceive to contain designed allusions to passages in the *Canticles*, but it must be confessed that in most of these examples the allusion is not very obvious. The objections to its canonical authority are now therefore derived solely from its internal character, and may be summed up in the following argument: that the book cannot form a part of Holy Scripture, since it contains no religious truth, unless we interpret it after a fashion for which there is no authority.

The book is a poem, or collection of poems, describing in imagery, which is certainly warm, but to an Oriental taste perfectly delicate, the chaste loves of a bridegroom and his bride. It bears the name of Solomon in its title, 'The Song of Songs, which is Solomon's;' and is supposed to be the only remaining one of the thousand and five songs which we are told that that monarch composed. According to the common opinion it was composed as an epithalamium at the marriage of Pharaoh's daughter with Solomon, who are respectively the bride and bridegroom of the poem; but under the guidance of divine inspiration it was so constructed as to form a mystical allegory representing the relation between Christ and his church.

First then with respect to its date and author. An attempt has been made, supported by the authority of Kennicott, to prove the poem later than the Babylonish captivity, simply from the insertion of the letter *Yod* in spelling the name of David, which was the spelling adopted after the Captivity, but not before. But as the name in question occurs only once, and as all our MSS. of the Hebrew Bible are comparatively modern, what is more probable than that the *Yod* was inserted by mistake in an early copy, and afterwards retained by transcribers? Whether this be the true explanation or not, Kennicott's argument is of no weight against the clear allusions to Solomon in the poem, and to circumstances connected with his history, which prove that it must have been written in his time (i. 5, 9; vi. 12; iii. 9, 10, &c.).

The style and language are not more different from that of the 'Book of Proverbs' than might be expected from the difference of the subjects. But the structure and contents of the poem are alleged as presenting insuperable obsistent to the supposition that Solomon was the author. It is contended that the scene is laid among the beauties of the open country, and not among courts and palaces; and that some of the bridegroom's portions of the poem being an expression of Solomon's feelings, they are the language of an humbler and happier man, who only refers to Solomon to contrast his numerous concubines and unbounded wealth with the treasure he himself possesses in his sole and undivided spouse. (vi. 8-10; viii. 11, 12.) But besides these passages which appear to place the scene in the country, others might be quoted which refer to the splendours and luxuries of a royal palace; and some which seem to have a direct allusion to Solomon's establishment, as it is represented in his history; and the passages which are thought to cast reflections upon Solomon are quite capable of a different interpretation. Again, with reference to the bride, it is contended that the poem itself proves her to have been not an Egyptian princess, but an Israelite. This point is very strongly if not conclusively brought out by Dr. Mason Good. On all these points the difficulty is much increased by the highly coloured imagery of the poem. But the first difficulty may perhaps be explained by supposing one or more changes of scene; there seem in fact to be several. The question respecting the person designed to be represented by the bride it has been attempted to solve in various ways. A writer in the 'Foreign Quarterly Review' (vol. xvi., p. 377) has adduced certain Egyptian hieroglyphics in support of the common opinion that Pharaoh's daughter is referred to. Dr. Mason Good imagines that the poem describes a *love-match* which Solomon made with some Israelitish woman after his *political* marriage with Pharaoh's daughter. A third mode of explanation, which if adopted would cut the knot, is that of Dr. James Bennett, who supposes that the poem never had any literal reference at all to an actual marriage, but is purely an allegory descriptive of the mutual love of Christ and his church. The reasons which Dr. Bennett adduces to prove that the poem would be most unsuitable to the circumstances of an actual marriage, are, to say the least, extremely fanciful; but the great principle for which he contends is one which the generality of critics admit in a case very nearly parallel to the present, namely, the 45th Psalm. But the minute allusions, especially those to Solomon, which are contained in this poem, are a most formidable objection to such an explanation; and even those critics who contend most strongly for the purely allegorical character of the 45th Psalm, maintain as strongly that the 'Song of Solomon' has a literal as well as a spiritual meaning. (See especially Bishop Horsley's 5th *Sermon*.) The distinction however between the two questions of who was the author and who the parties described, ought not to be lost sight of, as it too often has been. Finding the book in the Jewish canon, the presumption is that it is a genuine part of Holy Scripture, and is intended to teach religious truth. This presumption is strengthened, if it can be proved that Solomon was the author, since we have at least one other book of his in the sacred canon; but it is not disproved even if the poem should be found to have nothing to do with Solomon either as its author or its subject.

But this argument is met in another way, namely, by denying that the book is intended to convey any religious truth. This objection seems to proceed in a wrong direction; for inasmuch as Christ and the Apostles referred to the Jewish Scriptures, as they existed in their day, as containing the great body of religious truth, and we know that this book did form a part of the Jewish canon at that time, we ought to conclude that the diligent inquirer will find a religious meaning in it, rather than first deny the existence of any such meaning, and then argue from this assumption against its canonical authority. But the objection can be met upon its own merits. The composition, it is said, is a mere love-song: it bears nothing on its face to mark it as allegorical, nor have we any inspired authority for so regarding it.

Now it is admitted that from a very early period the Oriental nations have been accustomed to express religious sentiments allegorically under the guise of amatory poems, of which the Gitagovinda is an example. To this day the Egyptian Arabs, at their religious festivals, sing songs resembling this, in which the prophet is the beloved object, and which are only intended to have a spiritual sense. (Lane's *Modern Egyptians*, vol. ii., p. 193.) Mr. Lane in fact gives passages from these songs strikingly parallel to passages in Solomon's Song. Neither is it denied that similar imagery is used with a similar meaning in other parts of the Bible (*Psalm*, xlv.; *Isaiah*, liv.; lxii. 4, 5; *Rom.*, vii. 4; 2 *Cor.*, xi. 2; *Ephes.*, v. 23-32; *Rev.*, xix. 7; xxi. 2, 9), and also the opposite figure of representing idolatry and apostasy under the image of adultery or whoredom. But it is said that in all such passages the allusions are more distant, and enter less into detail than is the case in Solomon's Song, and that in them the religious sense is made so prominent that one can scarcely fail to perceive it. The first part of this assertion does not appear to be sustained by fact. Any one who examines the passages carefully, especially those which relate to spiritual adultery, will find allusions inferior in delicacy to the grossest which can be produced from Solomon's Song. The latter condition does not appear to be necessary (as has been argued above) to establish the allegorical meaning of such imagery, when occurring in a canonical book; neither is the spiritual sense always so obvious. For example, there is nothing in the 45th Psalm, except one or two expressions which could not by the greatest hyperbole refer to a human being, to lead us to suspect its spiritual meaning. Passages of the same kind might perhaps be adduced from Solomon's Song; but even if not, does not the admission that one love-poem which we find in the sacred canon is to be interpreted spiritually, furnish a presumption for putting a similar interpretation upon another? The fact that the 45th Psalm is quoted in the New Testament, and that the Song of Solomon is not so quoted, is no objection, for the quotation of the one sanctions the general principle of interpretation, while the silence respecting the other proves nothing, knowing as we do that the New Testament writers adopted the Old Testament canon as it existed in their day, and that this Song was in that canon. Nearly all expositors, both Jewish and Christian, have adopted the allegorical interpretation, though they have explained the allegory in different ways. The Chaldee Targum considers it as a figurative description of the love of God to Israel, as shown in delivering them from the Egyptian slavery, supporting and comforting them in the wilderness, and bringing them into the promised land. Christian expositors, from Origen downwards, have generally understood it as descriptive of the union between Christ and the church; but some few have explained it in a different way. Those who acknowledge its canonicity, but reject the idea of a reference either literally to Solomon or figuratively to Christ, take its admission into the canon to be a divine recommendation and praise of a single virtuous marriage as opposed to polygamy and concubinage. This appears to be now the opinion of the most distinguished modern opponent of its canonicity in England, Dr. J. Pye Smith. Various opinions are held as to the structure of the Song, the best of which appears to be that which takes it to be a series of Idyls.

(The *Introductions* of Eichhorn, August, Jahn, and Horne; Dr. Smith's *Scripture Testimony*, vol. i., c. 1, note A; *Papers* by Dr. Smith, Dr. Bennett, and others, in the 'Congregational Magazine' for 1837 and 1838; Calmet's *Dictionary*, art. 'Canticles,' with fragments in Taylor's edition; *The Song of Songs*, by Thomas Williams, Lond., 1801; *The Song of Songs*, by Mason Good, Lond., 1803; other *Commentaries* in Horne, vol. iv., part ii.; Lowth's *Prælections*.)

SOLOMON'S ISLANDS. [NEW GEORGIA.]

SOLON, son of Execestides, and a descendant of the royal house of Codrus, was born about B.C. 638, in the island of Salamis. His father is said to have considerably diminished his property by his liberality, and that Solon in his youth engaged in mercantile undertakings in order to better his circumstances. For this purpose, or, according to others, in order to satisfy his thirst for knowledge, he visited various countries. The time when he returned and settled at Athens is not quite clear, but it seems very probable that it was soon after the Cylonian conspiracy (612 B.C.), when he must have been about twenty-six years old. Athens at this time was in a deplorable condition: it was distracted by internal feuds, and unable to maintain itself against its hostile neighbours. It had shortly before been deprived of the island of Salamis by the Megarians, and in the ensuing war Athens had suffered such losses, that at last a decree was made that any one who ventured to propose the continuance or renewal of the war should be punished with death. (Plut., *Sol.*, 8; Diog. Laert., i. 46.) Solon, indignant at the humiliation of Athens and the pusillanimity of her citizens, devised a plan by which he hoped to rouse the Athenians to renewed activity without incurring the penalty of the law. Being endowed by nature with considerable poetical talents, as appears from the fragments of his works, he composed an elegy upon the loss of Salamis (Müller, *Hist. of the Lit. of Antient Greece*, i., p. 117), and assuming the appearance of a madman, he rushed into the Agora, where a crowd soon gathered around him. Here he recited his poem to the multitude, and its inspiriting influence, together with the probably preconcerted assistance of some of his friends, had such an effect upon the people, that they not only repealed the law respecting Salamis, but resolved to try once more to recover that island. Solon was placed at the head of the Athenian forces, and led them to victory by a stratagem which is differently described by antient writers. (Plut., *Sol.*, 8, 9.) All the Megarians in Salamis were either slain or dismissed to their homes, and Salamis again came into the hands of the Athenians. This successful undertaking, in which the Athenians also appear to have gained possession of Nisaea, raised Solon to a very high degree of popularity. In the war between Delphi and Cirrha (about 600 B.C.), Solon advised the Athenians to support the former city against the sacrilegious Cirrhaeans. His advice was followed and crowned with success, for Cirrha was destroyed, and Solon's fame now spread through all Greece.

In consequence of the massacre of the friends of Cylon, notwithstanding their having taken refuge in the temples and at the altars of the gods, the republic was at this time divided between two parties, which were as much the result of religious fears and scruples as of the political state of the country. A part of the Athenians were enraged against Megacles and his associates for their violation of all religious feelings, and the surviving friends of Cylon did their utmost to foster this hostility against their enemies. The Megaclids were looked upon as a cursed race, and the Cylonids were gaining fresh strength every day. It was evident that peace could not be restored until the Megaclids had atoned for their crime, and delivered the city from the curse they appeared to have brought upon it. Solon, who appears to have belonged to neither party, enjoyed the full confidence of his fellow-citizens, and when the dissensions had reached their highest pitch, he persuaded the Megaclids to submit their case to the decision of a commission of 300 persons to be chosen from among the nobles. The sentence of this court was that the surviving Megaclids should be sent into exile, and that the bodies of those who had died should be taken from their graves and be carried beyond the frontiers of Attica. During these troubles at Athens the Megarians renewed their attempts upon Salamis with success. Both the Megarians however and the Athenians were unwilling to engage again in a long and tedious warfare, and both agreed to request the Lacedaemonians to appoint a commission of five men to investigate the claims of the two states. Solon, who was the spokesman on the part of the Athenians, established by various means the legitimacy of the claims of his country, which thus again came into the possession of Salamis. (Plut., *Sol.*, 10, 12; Diog. Laert., i. 48.)

Notwithstanding the removal of the Megaclids from Athens, the party feuds continued to rage as before. For besides the religious scruples arising from the crime of the Megaclids, which still seemed to call down the divine wrath upon the city, there were other causes, which could only be removed by a reform of the constitution. This however could not be effected with any degree of success, unless all religious fears and apprehensions were allayed by a complete purification of the city. This was done by Epimenides of Crete, whom the Athenians invited for this purpose. The way was thus prepared for the legislation of Solon.

The three antient local divisions of the country, the lowlanders (Πεδιεῖς or Πεδιαῖοι), highlanders (διάκριοι), and the inhabitants of the coast (Πάραλοι), formed three distinct political parties; the highlanders being the most democratical, the lowlanders the most oligarchical, and the men of the coast, who took a middle course, wishing to reconcile the two other parties. Besides these political parties, a struggle was going on between the wealthy and the poor. Many of the latter had not only lost their property, but, not being able to pay their creditors, had become the bondsmen of their wealthy oppressors, and some had even been sold as slaves into foreign countries. (Plut., *Sol.*, 13.) The most moderate and wisest among the Athenians saw that this state of things could not last, and that if no remedy was applied, the time would soon come when the people would take the power into their own hands. Solon appeared to be the only man who was impartial and skilful enough to mediate between the hostile parties. In the year B.C. 594 he was invested with the office of archon, and requested to act as mediator and to frame a new code of laws. In considering the legislation which he undertook, it should constantly be borne in mind that he received from both parties full power to arbitrate between them; and he acted in the name and on behalf of his country. The sincerity with which he acted is manifest from the fact that he resisted all temptations and exhortations of his friends to make himself tyrant of Athens, which he might undoubtedly have done without much difficulty, and that he himself lost a considerable part of his property by his own legislation.

The legislation of Solon consisted of two main parts: the one embraced those measures by which he intended to remove the evils under which the republic was actually labouring; the object of the second was to establish the constitution upon such a basis as would prevent the recurrence of these evils. The first step he took was to relieve those who were oppressed by debts. This was done in a manner which did not cause too great loss to the rich, and was yet a great relief to the poor, by a measure called *σεισάχθεια*, or a disburdening ordinance, by which he not only established a reduction of the rate of interest (which was probably made retrospective), but also lowered the standard of the silver coinage in such a manner that 73 old drachmae became worth 100 new ones. (Plut., *Sol.*, 15.) He also released the pledged lands, and restored them to their owners, but it is not clear whether this was effected by a particular measure, or whether it was included in his disburdening ordinance. Those citizens who had been enslaved by their creditors were restored to freedom, and those who had been sold into foreign countries seem to have recovered their liberty at the expense of those who had sold them. Finally, the law which gave to the creditor a right to the person of his insolvent debtor was abolished. Some of the antient writers state that he cancelled all debts, but the best authorities do not mention any such measure, which is the more improbable, as we read that the most violent democrats, who would certainly have been pleased with it, were not satisfied with his disburdening ordinance. If we except the extreme of both parties, the relieving measures of Solon were received with universal approbation, and sacrifices were offered to the gods for the happy change. Thus encouraged, Solon proceeded to the second and more difficult part of his task. The first thing he did was to abolish the bloody laws of Draco, with the exception of those relating to murder. The characteristic feature of the new constitution was, that he substituted property for birth as a title to the honours and offices of the state. The change brought about by this new standard could not at first be great, as the eupatrids were undoubtedly the wealthiest citizens. According to their property, he divided the whole population of Attica into four classes, and regulated their political rights and duties according to the amount of their income from their landed property. The first class comprised all those citizens whose estates yielded a yearly income of 500 medimni (a medimnus is a bushel, six pints and a fraction) of dry or liquid produce, whence they are called πεντακοσιομέδιμνοι; the second, those who had 300 medimni, and could keep a war-horse, whence they were called ἱππεῖς, and formed the Athenian cavalry; the third contained those whose estates yielded 200 medimni. They were called *ζευγῖται*, from the yoke of cattle for the cultivation of their fields, and formed the heavy-armed infantry in the Athenian armies. All the remaining population whose income did not amount to 200 medimni constituted the fourth class, with the name of θῆτες, that is, hired labourers, who were excluded from all the offices of the state, and formed the light-armed infantry in the armies, as subsequently they also manned the fleets. They had however the right of voting in the popular assembly, as well as the exercise of the judicial power, which Solon placed in the hands of the people. The archonship and the other great civil and military offices, which had before been held by the nobles alone, became now accessible to all the citizens contained in the first class, while the second and third classes had access to all the minor offices. The public burdens were distributed according to the classes; but as the lower classes had fewer political rights than the higher, the contributions to the necessities of the state were for the lower classes proportionally light, for the second and third classes were not taxed according to the real value of their property, but that of the second class was reduced by one-sixth, and that of the third class by one-third below its real value. (Böckh, *Staatshaush.*, ii., p. 99, &c.) The fourth class was altogether exempted from direct taxes. This distribution of power and duties was, as Solon himself expressed it, intended to give to the people as much power as would enable them to protect themselves, and to the wealthy as much as was necessary to maintain their dignity. (Plut., *Sol.* 18.)

The four old tribes into which Attica was divided were left unaltered by the new constitution. The magistrates also appear to have retained the same power which they had had before, with the exception that they were now made responsible for the exercise of it to the people, and not, as before, merely to the order of the nobles. From the judicial sentence of a magistrate an appeal also was left to the popular courts of justice, which were numerously composed of citizens of all classes indiscriminately. (Thirlwall, *Hist. of Greece*, ii., p. 39, &c.) Two other institutions, which were intended as bulwarks against democratical extravagance, the senate of four hundred and the council of the Areopagus, are almost unanimously ascribed to Solon. But as regards the senate, there can be no doubt that it existed previous to the legislation of Solon, and was composed of the nobles, but its number cannot be ascertained with any accuracy. Solon raised it to the number of four hundred, and threw it open to all citizens belonging to the first three classes, in such a manner that each of the four tribes was represented in it by one hundred members. Whether these members were elected, as Plutarch states, or whether they were appointed by lot, as in subsequent times, is uncertain. Each member however had to give evidence of his qualification by an examination called *δοκιμασία*, and no person was eligible who had not attained the age of thirty. All members of the senate were changed every year, at the end of which they were liable to give an account of their conduct during the time of their administration. The senate was divided into sections, called prytanies, which succeeded each other in the management of the affairs throughout the year, and held their assemblies in the Prytaneum. The most important part of their business consisted in preparing those measures which were to be laid before the popular assembly, which had the power to accept, reject, or modify them. The senate however had other powers connected with the finances and other branches of the administration. Concerning the council of the Areopagus, see AREOPAGUS.

As regards the rights which Solon gave to the popular assembly, no measures could originate in it, but its discussions were confined to such measures as had been prepared by the senate. Every citizen, to whatever property-class he belonged, had a right to take part and to speak in it, so that the vote of the wealthiest nobleman had no more weight than that of the poorest labourer. No one however was allowed to speak who had not attained the age of twenty, and the oldest persons were called upon by the crier to vote first. Though the political power of the assembly was limited, the judicial power with which Solon invested it was considerable. Out of the popular assembly 6000 men above the age of thirty were chosen every year by lot, to form a supreme court of justice called the *ἡλιαία*, to which appeals were made from the sentence of magistrates, and which had in certain cases to take cognizance, independently of any other court, and in subsequent times assumed all judicial power in the state. The importance and influence of the Heliaea appears from the oath which the heliasts had to take at the time of their appointment, and which is preserved in Demosthenes (*c. Timocrat.*, p. 746).

It would be impossible to give any detailed account of the civil and criminal legislation of Solon, although there are many materials for such a purpose. It may suffice here to state, that although he did not in the same degree as Lycurgus interfere with and regulate the private affairs and the mode of living of his fellow-citizens, yet, like most ancient legislators, he did not think any part of the life of the citizens unworthy of his attention. The education of the young, and the conduct of women as well as of men, were to him as important as any of those subjects which in modern times alone engross the attention of legislators. Plutarch (*Sol.*, 18) states that Solon clothed his laws intentionally in obscure language, for the purpose of increasing the influence of the courts of justice. But surely nothing is more contrary to the whole spirit of his legislation than such a scheme, and the alleged obscurity, if it existed at all, was probably nothing more than the natural consequence of the state of the language in the days of Solon, in comparison with what it was two centuries later.

The Attic tribes had from early times been divided into forty-eight naucraries, and Solon is said to have established the law according to which each of these naucraries was charged with the equipment of a trireme and the mounting of two horsemen. If this is true, he must be regarded as the founder of the Attic navy. (Phot., s. v. *ναυκραρία*.) Solon also encouraged the arts and manufactures, and for this purpose he invited foreigners to settle at Athens. (Plut., *Sol.*, 24.) The calendar likewise received some improvements from Solon.

He had made such arrangements in regard to the observations of his laws, and their constant revision, that it is impossible to place any confidence in the statement of Plutarch, that he enacted them to remain in force unaltered only for a century. The laws were inscribed upon wooden tablets, put together in pyramidal blocks, which turned upon an axis. They were at first kept in the Acropolis, and afterwards in the Prytaneum. These axes were called *ἄξονες* and *κύρβεις*, and according to some authors the former contained the civil, and the latter the religious laws. (Plut., *Sol.*, 25.)

When his legislation was completed, Solon is said to have been so much annoyed at Athens by the remarks of the discontented, and the importunate inquiries of the curious, that he asked permission to leave Athens for ten years, hoping that during this period the people would become familiar with their new institutions. The permission was granted, and Solon is said to have visited Egypt, Cyprus, and Asia Minor. The beautiful story of his interview with Croesus, king of Lydia, which is told by Herodotus, Plutarch, and others, is inconsistent with chronology, as even some of the ancients have observed, for Croesus did not come to the throne till about 560 B.C., some twenty or thirty years later than the time at which Solon must have visited Asia Minor. (Voemel, *Exercitat. Chronolog. de Aetate Solonis et Croesi*, Frankf., 1832.) On his return he found Athens again distracted by factions. The three parties, of the highlanders, the men of the plain, and of the coast, were again engaged in hard struggles. The first of these parties was headed by Pisistratus, the friend of Solon, the second by Lycurgus, and the third by Megacles. Solon exerted all his powers to avert the threatening danger, and to reconcile the heads of the parties. But he laboured in vain, and although Pisistratus listened to him respectfully, he secretly continued to work out his plan. [PISISTRATUS.] When Pisistratus had established himself as tyrant of Athens, Solon, who was probably convinced that the mild rule of one man was, after all, greatly preferable to the continuance of party struggles, is said to have supported the tyrant with his advice. At the same time, he withdrew from public life. How long he survived the ascendency of Pisistratus is not certain, but according to the most probable account he died soon after, in the year B.C. 559. (Clinton, *Fast. Hell.*, ii., p. 301.) Respecting the constitution of Solon, see Thirlwall, *Hist. of Greece*, ii., pp. 23-58.

From the numerous works ascribed to Solon, it appears that he must have devoted all his leisure hours to the muses; and he is said to have done so to the last moment of his life, for at the time when he died, he is said to have been engaged in writing a poem upon the state of Attica previous to the Ogygian flood, and its wars with the inhabitants of the island Atlantis, which was afterwards swallowed up by the Atlantic Ocean. (Plut., *Sol.*, 31, &c.) We are enabled to judge of his poetical powers from the few fragments which are still extant. They are distinguished by a graceful simplicity and great vigour. They have been collected by Fortlage, in a work entitled 'Solonis Carminum Fragmenta, Graece, cum variis lectionibus notisque,' Lipsiae, 1776; and by N. Bach, in 'Solonis Carmina quae supersunt, emend. atque annot. instr.,' Bonn., 1825, 8vo.

SOLOR. [SUNDA ISLANDS, LESSER.]

SOLOTHURN (*Soleure*, in French), a canton of Switzerland, is bounded on the north by Basle, on the east by Aargau, on the south by Bern, and on the west partly by Bern and partly by France. Its shape is extremely irregular, the boundaries being conventional, and not marked by natural limits: the area is about 270 square miles. It is crossed in the direction from south-west to north-east by the Jura, which forms several parallel ridges, and covers the greater part of the canton. The principal valley is that of the Aar, which runs in the same direction, flowing eastward of the Jura. The highest summits of the Jura in the canton of Soleure are the Weissenstein and the Hasenmatt, which latter is about 4400 feet above the sea. The canton of Soleure is one of the most productive in Switzerland, especially in corn, fruit, and vegetables. The vine thrives only in certain localities. The mulberry-tree is cultivated, and some silk is made. There were in 1835 about 28,000 head of horned cattle, 19,000 sheep and goats, 19,000 pigs, and 4700 horses, the average value of which is from twelve to eighteen pounds sterling each. The horse-fair of Soleure is one of the principal in Switzerland. A considerable quantity of cheese is made, both of cow's milk and goat's milk, and part of it is exported. Part of the mountains are covered with timber-trees, especially fir and beech. The canton abounds in iron-mines, and the ore is smelted in the furnaces of St. Joseph, and worked at the iron-works of Klus. The other manufactures consist of leather, paper, woollens, and kirschwasser. There are also quarries of marble and gypsum.

The population of the canton, according to the census of 1835, amounted to 62,400, distributed among 134 communes. A dialect of the Swiss-German is the language of the country. The inhabitants are Roman Catholics, with the exception of those of the district of Bucheggberg, and a small congregation in the town of Soleure, which profess the Helvetic reformed communion. Most families are possessed of landed property. Every commune has now an elementary school, and a normal school, or school for teachers, has been established at Soleure. Most of the communes have a bourse, or fund for the relief of their own poor.

The constitution of Soleure was for a long time aristocratical, as in most of the Swiss cantons, but in January, 1831, a new constitution was framed, on a more popular system. The mode of election of the members of the legislature is by means of electoral colleges, as in France.

The canton is divided into ten electoral circles, each having its electoral college, which names a certain proportion of members to the great council or legislature. The town of Soleure returns 34 out of the 109 members who compose the great council. A little council, chosen from among the members of the great council, constitutes the executive. The members of the great council are renewed every six years.

Solothurn, or **Soleure**, a bishop's see, and the head town of the canton, is built on both banks of the Aar, 1320 feet above the sea, and is surrounded by walls. The population is 4200. The cathedral is reckoned the finest church in Switzerland; the tower is 190 feet high. The canons of Soleure receive about 2600 francs a year, and the emoluments of the bishop are 10,000 francs. The other remarkable buildings of Soleure are the town-house, which is very old, the arsenal, the theatre, the hospital, the fountain in the market-place, the former church of the Jesuits, and several convents. Soleure has a gymnasium with six professors, a lyceum with three professors, and a faculty of theology divided into three classes. The town library has 15,000 volumes. There are also the library belonging to the cathedral, which is said to contain some valuable manuscripts, and several libraries belonging to convents and to the gymnasium. Soleure has a botanical garden, a cabinet of natural history, a society for the natural sciences, founded in 1823, a medical society, a literary society, a dramatic society, and a military society. Soleure is nineteen miles north of Bern, and twenty-six miles south of Basle.

Olten, on the left bank of the Aar, about twenty miles north-east of Soleure, is the second town in the canton, and is a bustling, thriving place. It has several manufactories, some good buildings, and above 1500 inhabitants. (Leresche, *Dictionnaire Géographique de la Suisse.*)

SOLSTICES, the points of the ecliptic which are highest above the equator, at which, the sun's motion in declination being imperceptible, the days remain sensibly unaltered in length for several days together, as they would do if the sun absolutely stood still: whence the name. [Sun.]

SOLUTION. (Mathematics.) By the solution of a problem should be meant the method of finding that which the problem requires to be found; but the word is frequently understood to apply to the answer itself.

A solution is given when the problem is reduced to any other which was supposed to be known before the first was presented: the difficulty peculiar to the given problem is removed as soon as it is shown to be capable of reference to another and a lower class. Thus, though properly speaking a problem is not solved until the answer is presented in numbers, yet it is not thought necessary to require that such a result should be attained, provided the steps which are left are such as are well known and generally admitted. Thus an equation would be said to be solved were it found that the roots required are those of a given quadratic; for no one is supposed ignorant of the mode of then finding them.

A *geometrical* solution, in the strict sense of the word, is one in which only the means of construction admitted by Euclid, or others deducible from them, are employed in its attainment. This is the least finished of all solutions; for a mode of laying down the various points which terminate lines is not, generally speaking, a mode of ascertaining their ratio. Nor must it be forgotten by the admirers of geometry that the most important part of a result, the expression of the ratios which the answer beers to the several data, is only indirectly obtained in their favourite method.

When more means than those allowed by Euclid are employed, the solution used to be called *mechanical*. It is rarely that such a solution is now employed.

An algebraical solution is one which employs algebra and arithmetic, to the exclusion of geometrical construction; that is, one in which the answer can always be directly calculated from a formula. Geometrical construction may be necessary for the demonstration of the solution: it is enough that the answer contain no directions to find lines or surfaces by construction.

An approximate solution is one which has an amount of inaccuracy necessarily. Thus if $3 + \sqrt{2}$ were the root of an equation, this solution would not be called approximate; for though $\sqrt{2}$ cannot be perfectly represented in a finite form, the symbol itself contains the mode of attaining the result with any degree of exactness short of perfection. But if $\sqrt{2}$ were found to five decimal places, the answer 1·41421 would be called an approximate answer. Most solutions must terminate in an approximate representation. [Transcendental.]

SOLVENT is that which has the power of rendering other bodies liquid; and chemically, a menstruum. Of all solvents, water is the most universal and useful; it dissolves a great number of neutral vegetable products, as gum, sugar; and of saline bodies, as common salt, sulphate of soda, &c. The resins are not soluble in water, and oils do not combine with it, nor has it the power of dissolving any metal whatever while it retains its metallic properties; it is only the oxides even of the lately discovered metals of the alkalis and alkaline earths which are taken up by it, except indeed such metallic oxides as were previously known to possess acid properties. The solvent of resinous bodies is alcohol, and of some similarly constituted substances; while caoutchouc is insoluble in it, but is dissolved by naphtha, oil of turpentine, and æther.

The metals are insoluble in any solvent until they have suffered some change by its action, or by a similar change differently produced; thus, when zinc is put into nitric acid, that acid acts as a solvent, because the metal, by decomposing a portion of the acid, is converted into an oxide; and after this, whether it be effected by the acid or by the action of heat and air, the metal, or rather metallic oxide, becomes soluble not only in nitric acid, but in an aqueous solution of the alkali ammonia and of potash.

Heat has great power in altering the solvent power of bodies; in most cases it increases it, and hence, when it is required to crystallize certain salts, they are dissolved in hot water, and the solvent power of the water diminishing as the solution cools, the salt is deposited in crystals.

There are exceptions however to this increased solvent power by heat: thus lime is more soluble in water at 3 than at 60°, and at this latter temperature than at its boiling point. Sulphate of soda is more soluble in water at 3 than at 92°. There is a remarkable difference between the solvent power of hot and cold water with respect to a gaseous bodies; owing to their disposition to resume the elastic state, gases are readily expelled from solution by heat, and, as might be expected, in many cases, the solvent power is increased by cold.

It has been already mentioned that gum is soluble in water, while resin is taken up by spirit, and each is insoble to the other, so that when we mix an aqueous solution of gum with a spirituous solution of resin, both are rendered insoluble and precipitated together, owing to the combination which takes place between the spirit and the water. When any solvent has taken up as much of any particular substance as it is capable of, the solution obtained is termed a saturated one; and what shows that the change of form from solid to fluid is the result of chemical affinity, is the fact that water which is saturated with one substance will take up another; thus a saturated solution of common salt will still dissolve sulphate of soda, and some nitre.

We shall conclude this subject with adducing an example of the chemical nature of solution, and the extent to which it is applied in chemical researches connected with the insolubility of some substances.

Thus yellow copper ore is a compound of sulphur, copper, and iron. Put it into water, no action takes place, the component parts being quite insoluble in it; put it into dilute nitric acid and apply heat, and it is totally dissolved. The sulphur, acquiring oxygen, becomes sulphuric acid; the copper, combining also with oxygen, becomes oxide of copper; and the iron from the same cause becomes peroxide of iron; and both these oxides combine with the sulphuric acid formed, and remain in solution as sulphates of copper and iron. The next operations are to determine the quantity of the acid formed, and of the oxides with which it is combined, and this is effected by a solution of nitrate of barytes, the base of which combines with the sulphuric acid, and the sulphate of barytes, being an insoluble salt, is precipitated. The oxides of copper and iron are now held in solution by the nitric acid of the decomposed nitrate of barytes; and these oxides are separated by finding a substance which acts as a solvent upon one and not upon the other; ammonia dissolved in water is such a body; when added to the mixed solution in excess, it dissolves the oxide of copper and leaves the peroxide of iron unacted upon.

Thousands of analogous and of more complicated cases might be adduced, but the above, without carrying out the analysis or showing how the quantity of sulphur is estimated from that of the sulphate of barytes, or the quantities of copper and iron from their oxides, is sufficient to prove the important action of solvents, and of the varied application of solubility and insolubility in chemical investigations.

SOLWAY FRITH, an estuary or inlet of the sea, on the western side of the island of Great Britain, separating, in one part, England from Scotland. This estuary extends inland, from a line drawn between Burrow-Head in Kirkcudbrightshire to St. Bees' Head in Cumberland, 41 miles north-east to Solway Moss at the mouth of the Esk. The line between the two above-mentioned headlands, which may be regarded as measuring the mouth or entrance of the Frith, is more than twenty miles long. About seventeen miles up, between Southerness Point, Kirkcudbrightshire, and the Cumberland shore near Allonby, the width is diminished to seven miles; it afterwards expands, then again contracts; and fifteen miles farther up, between the mouth of the Annan, Dumfriesshire, and Bowness, Cumberland, is reduced to two miles: this continues to be the width of the estuary for the remaining nine miles to its termination.

On the north-west or Scottish shore, the Solway Frith is bounded near its entrance by the stewartry or shire of Kirkcudbright, from which it receives the river Urr, and in its upper part by Dumfriesshire, from which it receives the Nith and the Annan. On the south-east or English shore, and at its head, the frith is bounded by the county of Cumberland, from which it receives the Esk, with its tributaries the Liddle and the Line; the Eden, with numerous tributaries; the Wampool, the Waver, the Ellen, and the Derwent. It receives in fact the drainage of the district bounded on the north-west by the higher grounds of East Galloway; on the north by the Lowthers and the connected hills; on the north-east by the heights which unite these to the Cheviot and other border hills; on the east by that part of the Pennine chain which extends from the border hills southward to the heads of the Eden and the Yore or Ure, including Geltdale, Milburn, Lune, and Stainmore forests; and on the south by the mountains of the Cumbrian group.

The shores of Solway Frith are for the most part low. At St. Bees' Head are lofty cliffs, and there are cliffs again for a short distance between Whitehaven and Workington, and between Maryport and Allonby; but all the Cumberland shore from Allonby to the head of the frith is low and sandy. The shore of Dumfriesshire is also low and sandy, and lined in several parts with marshes, locally termed 'mosses' or 'flows.' The shore of Kirkcudbrightshire is loftier; and in this part, not far inland from the shore of the frith, Criffel mountain rises to the height of 1830 feet. A considerable part of the frith within Southerness Point and Allonby is occupied by broad sands, dry at low water, and intersected by the channels formed by the streams which flow into the frith. The frith is navigable through the greater part of its extent for vessels of 300 tons, and for those of 100 tons up to the head. It affords a supply of different kinds of fish, especially salmon, of which there is a valuable though declining fishery. The tide sets into it with great force, the flood sometimes advancing with a head three or four feet high. The water has a whitish colour from the great extent of sand over which it flows.

At the head of Solway Frith is Solway Moss, a tract of bog in the parish of Kirk-Andrews-upon-Esk, in Cumberland. In 1771 this bog burst, and overflowed several hundred acres of fertile land, sweeping away the tenants' houses with its black stream. The damage was at first thought to be irreparable; but by great exertion and expense the land was again brought into cultivation, and all trace of the catastrophe obliterated.

Solway Moss is memorable for the defeat of the Scots, A.D. 1542. A body of 10,000 men, under Lord Maxwell and the Earls of Cassilis and Glencairn, entered England; but the leaders were corrupt, and the men mutinous; and on being attacked by a force of 1400 English, the whole army took to flight, leaving nearly 1000 prisoners, of whom 200 were lords, esquires, or gentlemen. Lord Maxwell, the commander-in-chief, was among them. James V. of Scotland died of vexation at this defeat, about a month after it took place.

SOLWAY MOSS. [SOLWAY FRITH.]

SOMATE'RIA. [FULIGULINÆ, vol. xi., p. 2.]

SOMBRERE'TE. [MEXICAN STATES.]

SOMERS, JOHN, LORD SOMERS, was born at Worcester, where his father, of the same name, was an attorney in good practice. His mother was Catherine Ceavern, of a good family in Shropshire. The year of Somers's birth is supposed to have been 1650; but some accounts make it to have been 1652. We are not aware upon what authority it has been sometimes stated, or assumed, that the day on which he was born was the 4th of March.

Somers's father, who was a zealous Commonwealth man, and had commanded a troop under Cromwell in the civil war, intended to breed his son to his own profession. He managed the estates of the earl (afterwards duke) of Shrewsbury, who often visited him, and in that way had his attention early attracted to the promising qualities of young Somers. He was also connected by electioneering services with the member for the city, Sir Francis Winnington, afterwards solicitor-general, in whom his son found another useful patron when he entered the profession of the law. He died in 1681, when the subject of the present article inherited a small estate in Gloucestershire, which had been for some generations in possession of the family.

Young Somers however is said to have been educated at the expense of his father's sister, who had married Mr. Blurton, an opulent Worcester clothier, and who, having no children of her own, had adopted him *from* his birth. At her house, and not at that of his father, he resided throughout his boyhood. He appears to have been placed first at the cathedral school of Worcester, and afterwards at a private school at Walsall in Staffordshire; and it has also been supposed that after leaving school he may have spent a year or two in his father's office. While at school he is said to have been remarkable for his gravity of demeanour, as well as his studious habits. It is stated, on the authority of his friend Winnington, that at this time, 'by the excellence of his knowledge and behaviour, he discouraged his father and all the young men that knew him; they were afraid to be in his company.' This beginning would not lead us to expect the robust heartiness of character by which Somers was distinguished in after-life, nor the somewhat free or lax system of private morality as to certain points, of which indeed we have not a hint in the common formal biographies of the distinguished lawyer and statesman, but which nevertheless he is very well known to have adopted and practised.

Winnington has the credit of having advised that he should be sent to the bar. With this view he entered himself of the Middle Temple, and in 1674 was admitted a commoner of Trinity College, Oxford. In 1676 he was called to the bar, but although he never took any further degree than that of B.A., he continued to reside at the University for five or six years longer. To the latter part of this interval, between the completion of his studies and his removal to London and entrance upon the practice of his profession, belong the principal literary performances which he sent to the press:—1, 'The Memorable Case of Denzil Onslow, Esq., tried at the Assizes in Surrey, July 20, 1681, touching his election at Haslemere in Surrey;' 2, 'A Brief History of the Succession of the Crown of England, collected out of Records and the most authentic Historians,' 1681; reprinted 1714; 3, 'A just and modest Vindication of the Proceedings of the two last Parliaments,' [in which the question of the exclusion of the Duke of York had been agitated,] 1681, (a reply to the king's declaration,) at first penned, according to Burnet, by Algernon Sidney, but afterwards drawn out anew by Somers, and finally corrected by Sir William Jones, who had been attorney-general a few years before; but, adds Burnet, 'the spirit of that side was now spent; so that this, though the best writ paper in all that time, yet had no great effect;' 4, 'The Security of Englishmen's Lives; or the Trust, Power, and Duty of the Grand Juries of England, explained according to the fundamentals of the English government,' 1681, written on the failure of the charge against the earl of Shaftesbury; 'it passed,' says Burnet, 'as writ by Lord Essex, though I understood afterwards it was writ by Somers, who was much esteemed and often visited by Lord Essex, and who trusted himself to him, and writ the best papers that came out in that time.' He had before this time contributed poetical versions of Ovid's 'Epistles of Dido to Aeneas, and of Ariadne to Theseus,' to Tonson's edition of Ovid's 'Epistles' in English; and a translation of Plutarch's 'Life of Alcibiades' to the English Plutarch, 'by various hands,' produced by the same publisher. And there is also attributed to him an original English poem, of some three hundred lines, entitled 'Dryden's Satire to his Muse,' a libellous attack on that poet, which, from several allusions in it, must have been written early in 1682. It has a considerable portion of the strength, as well as the coarseness, of Dryden's most prosaic manner. Walpole, in his 'Royal and Noble Authors,' expresses his opinion that 'the gross ribaldry' of this poem 'cannot be believed to have flowed from so humane and polished a nature as Lord Somers's;' but this, we apprehend, is to carry out too strictly, or too far, the figure with which Walpole introduces his notice of Somers—that he was 'one of those divine men, who, like a chapel in a palace, remain unprofaned, while all the rest is tyranny, corruption, and folly.' The poem is printed in part ii. of the 'Supplement to the Works of the Minor Poets,' pp. 3-11.

Somers, whose ability and professional learning were already well known to a circle of influential friends, at last came up to London in 1682, and commenced practice at the bar. The first cause of public importance in which he was engaged was the prosecution of Pilkington and Shute, sheriffs of London, and other members of the Whig party, who were tried and convicted, in May, 1683, for a riot at the last election of sheriffs, in which he appeared as junior council to his friend Winnington for the defendants. From this time, it is stated by the writer of the Memoirs of his Life, 8vo., London, 1716, that his practice increased daily, so that in the reign of James II. his professional income already amounted to 700*l*. a year, which was in those days a large sum for a barrister of his standing; and, according to this authority, 'he was looked upon as one of the most rising counsel in England, before he appeared at the trial of the Bishops.'

But no doubt his being selected to be one of the counsel for the defence in that celebrated case, tried in the Court of King's Bench, in June, 1688, was what first brought him prominently before the public eye. He was selected, it is stated, on the strong recommendation of Mr. Pollexfen, one of the leading counsel for the bishops, and a lawyer of the highest eminence. 'I have heard one of the bishops declare,' says Bishop Kennett, in a note to his 'Complete History,' 'that objection was made among themselves against Mr. Somers as too young and obscure a man; but old Pollexfen insisted upon him, and would not be himself retained without the other; representing him as the man who would take most pains, and go deepest into all that depended on precedents and records.' Somers's speech occupies only about a column in the 'State Trials' (vol xii., p. 396); but it is probable that his seniors were indebted for much of their matter to his learning and research.

From this time Somers is to be regarded as one of the leading political persons of his time. He is understood to have been associated with his friend Shrewsbury and the other chiefs of the Whig party in the negociations and arrangements which resulted in the coming over of the Prince of Orange; and he was taken into the confidence of William from the first. He was returned as one of the representatives for Worcester to the Convention, which met in January, 1689; and he took a distinguished part in the debates in the Commons and the conferences with the Lords, which terminated in the adoption, by both houses, of the decisive resolution that the late king had 'abdicated' the government. Somers indeed was a member of the first and chairman of the second of the two committees which prepared the Declaration of Right; and it was perhaps mainly drawn up by him, as is hinted by Burke, who, in his 'Reflections on the Revolution in France,' says, 'I never desire to be thought a better Whig than Lord Somers, or to understand the principles of the Revolution better than those by whom it was brought about; or to read in the Declaration of Right any mysteries unknown to those whose penetrating style has engraved in our ordinances, and in our hearts, the words and spirit of that immortal law.'

Under the new government preferment flowed fast upon Somers. In the beginning of May, 1689, he was made solicitor-general and knighted; on the 2nd of May, 1692, he was made attorney-general; and on the 23rd of March in the same year, he was promoted to the office of lord-keeper of the great seal. This last appointment, of course, though he was not yet raised to the peerage, removed him both from Westminster Hall and from the House of Commons. 'All the people,' says Burnet, 'were now grown weary of the great seal being in commission; it made the proceedings in Chancery to be both more dilatory and more expensive; and there were such exceptions made to the decrees of the commissioners, that appeals were brought against most of them, and generally they were reversed. Sir John Somers had now got great reputation, both in his post of attorney-general and in the House of Commons; so the king gave him the great seal. He was very learned in his own profession, with a great deal more learning in other professions—in divinity, philosophy, and history. He had a great capacity for business, with an extraordinary temper; for he was fair and gentle, perhaps to a fault, considering his post; so that he had all the patience and softness, as well as the justness and equity, becoming a great magistrate. He had always agreed in his notions with the Whigs, and had studied to bring them to better thoughts of the king, and to a greater confidence in him.' The most remarkable occasion on which Somers distinguished himself while holding the office of lord keeper, was what is called the case of the Bankers in the Court of Exchequer, in 1696. He delivered a judgment against the bankers, and reversing the decision of the barons of the Exchequer, which has been characterised by Mr. Hargrave as 'one of the most elaborate arguments ever delivered in Westminster Hall,' and in collecting books and pamphlets for which he is said to have expended several hundred pounds. It is contained in the report of the case in Howel's 'State Trials,' vol. xiv., pp. 39-105. This judgment however, in which he was supported by Treby, chief justice of the court of Common Pleas, but opposed by Holt, chief justice of the King's Bench, was afterwards reversed by the Lords; and Lord Dartmouth, in a note to Burnet's 'History,' asserts that when the decree which he had made was, after a very warm debate, set aside, Somers fell ill, and never appeared upon the woolsack more. This was in 1700.

Meanwhile, in 1697, Somers had been appointed lord-chancellor, and raised to the peerage by the title of Baron Somers of Evesham in the county of Gloucester. He appears to have had a seat in the cabinet from the time of his promotion to the place of lord keeper; and he was now generally regarded as one of the chiefs of the ministry, as well as one of the most attached and influential of the king's friends. This made him a principal object of attack on the part of the Tory opposition in the second, or last, session of King William's fourth parliament, which com-

[illegible] of November, 1698. After two successive charges brought against him had been negatived—the one for his having improperly, as was alleged, dismissed many persons from the commission of the peace; the other, founded on the affair of Captain Kid, who, after having been sent out in the command of an armament to destroy certain pirates in the West Indies, the expense of which had been very patriotically contributed by Somers, Shrewsbury, and some other noblemen, had taken to piracy himself,—a motion was made on the 10th of April, 1700, the day before the king came down to prorogue the parliament, that his majesty should be addressed to remove Somers from his presence and councils for ever. But this attempt also failed: the numbers, according to Lord Hardwicke, in a note to Burnet, were 106 for the motion, and 167 against it. Immediately before this, the bill for resuming the king's Irish grants had been carried through both Houses, in spite of the most strenuous opposition by the court, and the determination which William was at one time understood to have come to rather to risk everything than give his consent to the measure. 'While the bill was in suspense,' writes Lord Dartmouth, in a note upon Burnet, 'the whole city of London was in an uproar; Westminster was so thronged, that it was with great difficulty anybody got into either House. . . . All seemed under the greatest distraction. I heard the king was come to the Cockpit, and had sent for the crown, with a resolution to dissolve us immediately, which I communicated to the earl of Shaftesbury, who ran full speed with it to the House of Commons; upon which they adjourned in great haste.' It was this apprehension, according to Burnet, of the king's resorting to the violent measure of a dissolution in order to quash the bill, that provoked the second of the above-mentioned attacks of the Commons upon Somers. But the chancellor did not please either party in this unfortunate business. 'During the debates about the bill,' says Burnet, 'he was ill, and the worst construction possible was put on that: it was said he advised all the opposition that was made to it in the House of Lords; but that, to keep himself out of it, he feigned that he was ill; though his great attendance in the Court of Chancery, the House of Lords, and at the council-table, had so impaired his health, that every year about that time he used to be brought very low, and disabled from business.' Lord Hardwicke tells us, in a note on this passage, that for the conduct of Somers, in absenting himself from the House, and taking little or no share in the debates about the bill, 'it is said the king was angry with him, and made way to part with so wise a servant soon after.' It is certain at any rate, that, shortly after this, William resolved to endeavour to rid himself of the incessant annoyance and obstruction he received from the aversion the Commons had taken up against the chancellor by the dismissal of Somers. Tindal, who says that the account was given to Mr. Oldmixon by a gentleman who had it from Somers's own mouth, tells us that the first time Somers came to court after his illness, the king stated that it seemed necessary for his service that he should part with the great seal, and expressed his wish that he would make the delivering of it by his own act. Somers replied, that he knew this was what his enemies were driving after; that the seal was his greatest crime; and that if he quitted that, he should be freed from their abuse and persecution; but that he was resolved, with his majesty's permission, to keep it in defiance of their malice; adding, that 'he did not doubt but, if his majesty would be as firm to his friends as they would be to him, they should be able to carry whatever points he had in view for the public welfare in a new parliament.' His majesty however shook his head and said 'It must be so.' But Somers persisted in declining to offer the surrender of the seal, so that a few days after, on the 17th of April, the king sent Lord Jersey for it, with a warrant under his hand, on which, of course, it was immediately given up. About a month after it was given to Sir Nathan Wright, with the title of lord keeper.

After all, his ejection from office neither saved Somers from the enmity of the Commons, nor lost him the favour and confidence of the king. In the new parliament, which met in February, 1701, the Tories found themselves in a majority in the Lower House; and they had not sat long before they proceeded to direct their power against the chief of the king's friends and ministers, the Duke of Portland, Lord Somers, the Earl of Oxford, and Lord Halifax, all of whom it was resolved to impeach. The resolution to impeach Somers was carried at a late hour on the night of the 14th of April, by a majority of 198 to 188, after he had come down to the House, and been heard in his own defence. The principal, and indeed at this stage of the proceeding, the only crime laid to his charge, was the concern he had had in the two treaties for the partition of the Spanish monarchy [PARTITION TREATIES] which had been negociated in 1698 and 1699 by King William, without consulting with his ministers, and for which Somers had forwarded, at the king's desire, the necessary powers in blank under the great seal. We suppose there can be no question, but that, according to the modern practice of the constitution, no minister would be held to be justified in acting as Lord Somers admitted he had done in this case; but ministerial responsibility was not so well understood or so completely established in those early days of the system introduced by the Revolution as it now is. The precise charge against Lord Somers too, as stated in the resolution for impeaching him, was, that he had advised his majesty to the treaties; and that certainly was not and could not be made out, being in truth contrary to the fact. Afterwards fourteen distinct articles of impeachment were drawn out and sent up to the Lords, which charged his lordship distinctly with having presumed to affix the great seal to the blank commissions, contrary to the duty of his office, and in violation of the great trusts reposed in him, 'without communicating the same to the rest of the then lords justices of England, or advising in council with his majesty's privy council thereupon.' His conduct in the affair of Captain Kid, which surely was the very reverse of blameable, was also made the subject of one of the articles; but the most remarkable of the charges brought against him related to various personal grants of land and money which he was asserted to have begged and obtained from the crown—'many great, unreasonable, and exorbitant grants,' as they were styled, 'of several manors, lands, tenements, rents, hereditaments, and revenues;' besides the annual salary, or pension (as it is called), of 4000*l.*, which, 'through his majesty's most abundant grace and bounty,' he had received during all the time he was lord keeper and lord chancellor, over and above 'the fees, profits, and perquisites of or belonging to the great seal, established by law as a sufficient and ample recompense and reward for the faithful discharge of that high station.' The grants were alleged to consist of the manors of Ryegate and Howleigh, granted in 1697, to Joseph Jekyl, Esq., in trust for Lord Somers and his heirs—of certain fee-farm rents to the value in all of 32,000*l.*, granted at various times by pretended contracts, under which 'there was not any sum of money whatsoever really and *bonâ fide* paid as the consideration of the conveyances of the said rents' from the trustees to whom they were granted for Somers's benefit—and of certain other rents to the yearly value of nearly 400*l.* obtained in a similar manner. Somers in his answer stated that the 4000*l.* a year was the same allowance that had been made to several of his predecessors; and as to the other grants he pointed out certain deductions from their value to which the Commons had not adverted, and denied that there had been anything unlawful in the transactions, or that the grants had been obtained either in deceit of his majesty or in elusion of any acts of parliament. The affair ended, after many messages and conferences between the two Houses, by the Commons declining to appear to prosecute their impeachment on the day appointed by the Lords, under the pretence that the Lords had refused them justice in the matter; on which their Lordships pronounced him acquitted, and dismissed the impeachment. (See Howel's *State Trials*, xiv. 311.)

In October of this same year a negociation was opened by the king with Somers, through Lord Sunderland, for bringing him again into power; but his majesty's death, in March, 1702, put an end to the project after everything had been arranged. The speech with which William opened his last parliament, on the 31st of December, 1701, called by Burnet 'the best speech that he, or perhaps any other prince, ever made to his people,' was written by Somers; Lord Hardwicke mentions that he had seen the original in Somers's handwriting.

In 1702 Somers, unoccupied by the cares and toils of office, was elected president of the Royal Society. In 1706 he introduced and carried through parliament a bill 'for the amendment of the law, and the better advancement of justice,' which, although deprived of some useful clauses by the Commons, corrected various abuses in the courts both of Chancery and of Common Law. He also took a leading part in the discussion and arrangement of the great measure of the Union with Scotland, which was now at last brought to a conclusion, after having been again and again unsuccessfully attempted during more than a century. [SCOTLAND, UNION WITH.] It may also be mentioned, that the learned and able statement of the famous Aylesbury Election Case, ordered to be printed by the House of Lords in 1703, was, according to Mr. Speaker Onslow, drawn up by Lord Somers. He too, it is stated by Lord Hardwicke, was the author of the act passed in 1705, for the security of the Protestant Succession. [GEORGE I., vol. xi., p. 157.]

On the return of his party to power in 1708, Somers was made president of the council; and he held that office till the recovery of the cabinet by Harley and the Tories in 1710. He succeeded in making himself very acceptable to Queen Anne, notwithstanding her original prejudice against him. It is affirmed by Lord Dartmouth that he impressed her with a deep and grateful sense of his fidelity and integrity by his acquainting her with and putting her on her guard against a scheme entertained by the Duke of Marlborough to get himself made captain general, or commander of the forces, for life, which, without having so much as mentioned it to her majesty, his grace tried in 1709 to get proposed in the House of Commons, and expected the Whigs should all come into, in return for the great services he had lately done them. The following year, on occasion of the proposals for peace made by the French at Gertruydenberg, Somers strongly recommended the continuance of the war. He had of course gone along, apparently, with his colleagues in the prosecution of Sacheverell, in 1709; but Swift, in his 'History of the Four Last Years of Queen Anne,' tells us that he had heard from Lord Somers himself that he was against engaging in that foolish business, as foreseeing that it was likely to end in the ruin of the Whig party.

There is a curious note to Burnet's 'History of his own Time,' by Mr. Speaker Onslow, in which he relates some negociations that were carried on with Harley by Somers, Halifax, and Cowper, a short time before the change of ministers in 1710, on the basis of an overture made by Harley for keeping them in place, if they would consent to the substitution of himself and some of his friends for the lord treasurer (Godolphin) and his dependants. Onslow says that he had his information from Sir Joseph Jekyl, 'who,' he adds, 'had it very likely, and I think he said so too, from the Lord Somers, to whom he was brother-in-law.' The negociation was broken off in consequence of the opposition of Lord Wharton, who expressed his detestation of having anything to do with Harley.

Somers continued to take part occasionally in the debates of the House of Lords after his second dismissal from office; but the infirm state of his health is said by this time to have somewhat affected his intellect. In 1713 we find him joining in support of the factious motion brought forward by a section of the opposition, for leave to bring in a bill to dissolve the Union. 'I had it,' writes Onslow, 'from good authority (the late Sir Robert Monroe, then of the House of Commons), that at a meeting upon it at my lord Somers's house, where Monroe was, nobody pressed this motion more than that lord!" He resumed his place at the council-board after the accession of George I.; but his faculties were now almost gone. It is related, however, that he took an interest in the progress of the Septennial Bill, which he declared 'he thought would be the greatest support possible to the liberty of the country.' At last a stroke of apoplexy occasioned his death, on the 26th of April, 1716.

Lord Somers was never married, though it is stated by the author of the Memoirs of his Life, that when he was solicitor-general he paid his addresses to a daughter of Sir John Bawdon, a London alderman, and that he went so far in the matter as to deliver in a rental of his estate, after several meetings with the lady's friends; 'but,' concludes the story, 'the treaty broke off on account of a difference about the marriage-portion and settlement, to the great regret of the lady, when she found him made lord keeper of the great seal in two years' time.' His estates descended to the family of his sister, who was married to Charles Cocks, Esq., M.P., whose grandson, the father of the present Earl Somers, was created Baron Somers in 1784.

The character of Lord Somers has been elaborately drawn by Addison in one of the numbers of the 'Freeholder' (published 14th May, 1714), but with considerable wordiness, and something perhaps of the air of insincerity which commonly attaches to a formal panegyric. He had been an early and zealous patron of Addison, who had obtained his notice by inscribing to him his early poem on the campaigns of King William, and who afterwards dedicated to him the 'Travels in Italy,' and the first volume of the 'Spectator.' There is much more force in the more shaded picture of him which Swift has given in his 'History of the Four Last Years of Queen Anne;' nor perhaps, taken with the proper allowance, does it convey a less correct notion of the man.

The collection commonly called the 'Somers Tracts,' which has been twice printed, first in 1748, in 16 volumes, 4to., secondly, in 1809-15, in 13 volumes, 4to., under the superintendence of the late Sir Walter Scott, consists of scarce pamphlets selected, as the title intimates, principally from the library of Lord Somers. A valuable collection of original letters and other papers left by his lordship was unfortunately consumed in a fire which happened in the chambers of the Honourable Charles Yorke, then solicitor-general, in Lincoln's Inn Square, on the morning of Saturday, the 29th of January, 1752. Mr. Yorke's father, the Lord Chancellor Hardwicke, married Lord Somers's niece, Miss Margaret Cocks.

SOMERSET, EARL OF. [JAMES I.]

SOMERSET, EDWARD SEYMOUR. [EDWARD VI.]

SOMERSETSHIRE, an English county, situated on the shore of the Bristol Channel, by which it is bounded on the north and north-west sides. On the north-east it is bounded by Gloucestershire, from which it is in part separated by the river Avon; on the east by Wiltshire; on the south-east and south by Dorsetshire, and a small detached part of Devonshire; and on the south-west and west by Devonshire. Its form is irregular; the greatest length is from east by north to west by south, from the neighbourhood of Bath to Exmoor on the Devonshire border, 70 or 71 miles; the greatest breadth at right-angles to the length is from the coast at the mouth of the Avon to the Dorsetshire border between Milborne Port and Stalbridge, 40 miles. A small detached portion of the county is entirely surrounded by Dorsetshire: it lies between Sherborne and Blandford. The total area of Somersetshire is 1645 square miles: it is the seventh English county in respect of size, ranking next below Lancashire, and next above Hants.

The population by the different enumerations of the present century was as follows:—

Year of census.	Population.	Increase per cent.
1801	273,750	—
1811	303,180	12
1821	355,314	17
1831	404,200	13

The last enumeration gives 246 inhabitants to a square mile. In amount of population it is the eighth English county, being below Staffordshire, but above Norfolk; and in density of population the eleventh, its place being between Nottinghamshire and Leicestershire. Taunton, which has the best claim to be regarded as the county town, is 133 or 134 miles in a direct line west by south from the General Post-office, London; or 141 miles by the road through Basingstoke, Andover, Amesbury, Bruton, Castle-Cary, Somerton, and Langport.

Surface, Coast-line, and Geology.—Somersetshire is a hilly county; but the ranges of hills are separated by low marshy flats; so that, hilly as it is, it yet exceeds most counties in the extent of its fens. The north-eastern part is occupied by the eminences round Bristol and Bath, through which the Avon makes its way. These eminences are irregularly grouped, and extend along the north-eastern border, from Pill on the Avon below Bristol into Wiltshire: many of the valleys or 'combes' which separate the hills are drained by small streams which flow into the Avon. The principal heights in this part of the county are, Falkland Knoll near Norton St. Philip, between Bath and Frome; Lansdown (813 feet high), and Claverton, Combe, and Odd downs, near Bath; Dundry hill (790 feet high); Mays knoll, Cadbury, Sims, and North hills, which are summits of Broadfield down, south of Bristol; and Leigh down, west of that city.

The summits of the hills in the immediate neighbourhood of Bath are of the oolitic formations. The great oolite, the most important of these, which furnishes the fine-grained freestone commonly known as Bath stone, has a thickness probably of 130 to 150 feet. Masses of this rock are found scattered on the slopes of the hills which it crowns, covering the subjacent clays and fuller's-earth, which with the inferior oolite and calcareous sand, constitute the lowest members of the oolitic group, and form a terrace projecting into the subjacent valleys, beyond the great oolite and connected rocks which crown the summits of the hills. Sometimes these lower oolitic beds form outlying eminences, such as Stantonbury hill, Dundry hill, and Mays knoll. The inferior oolite is extensively quarried on Dundry hill, where it yields a good freestone. The general inclination of the strata of all these formations is to the south-east, but with a very small angle. Some remarkable derangements and dislocations are observable.

The oolites rest on a platform of the lias formation, which appears on the lowest part of the slope of the oolite hills, or forms detached hills to the south-west of them.

The valley of the Avon, and the other valleys which separate these hills, and are drained by streams flowing into the Avon, are occupied by the formations of the red marl or new red sandstone group. In some places the newer magnesian or conglomerate limestone, which underlies the new red sandstone, rises to the surface: it occasionally crowns the summits of the hills, but more usually is found in horizontal strata resting against the elevated beds of the coal-measures or of the mountain limestone, which latter, with the old red sandstone, forms the constituent mass of Leigh down and Broadfield down near Bristol. These two masses of mountain limestone are surrounded by the magnesian limestone conglomerate. The mountain limestone of Leigh down is prolonged across the Avon, and forms the well-known precipices of St. Vincent's rocks, Clifton, between which that river flows. Broadfield down has two precipitous combes or valleys, Cleve and Brockley, less magnificent than the defile of Cheddar, but possessing, from the abundance of wood, more beauty.

The coal-measures, mountain limestone, and old red sandstone belong to the carboniferous group of the Somersetshire and South Gloucestershire coal-field, and occupy the northern part of the county extending to the Mendip hills, though covered in most places by more recent formations. In this field are numerous coal-pits: the chief of them are in those parts (Bedminster, Nailsea, and the valley of the Chew below Keynsham) where the coal-measures have been denuded; but several are in the valley of the Midford brook, which extends from Combe Monkton near Bath to High Littleton, and in the adjacent valley, which extends from Combe Monkton to Radstock, where they are sunk through the superincumbent strata of the red marl, the lias, and even the lower oolite; this last is the case in a pit near Paulton, which is probably unequalled in the number of formations through which it passes before it reaches the coal: it penetrates through strata which in other parts would probably have an aggregate thickness of 2000 feet, but are here reduced, in consequence of the thinning out of many of the beds, to less than 400 feet.

The eastern side of the county, extending from Bath by Frome, Bruton, and Castle Cary to Yeovil, and the southern side from Yeovil by Ilminster to Wellington, are occupied by hills of similar geological character to those around Bath, and uniting with them in the neighbourhood of that city. The lower slopes, with some outlying eminences or ranges projecting to the west or north-west, consist of lias, upon which rest the lower oolitic formations, and upon these again the great oolite, with its associated beds. Rocks of the middle system or Oxfordian formations and of the green-sand formation, and even chalk, are found in several places along the border of the county. This range is divided into detached parts by the transverse valleys of the Brue, the Yeo or Ivel, the Parret, and the Isle; and that portion which lies west of Ilminster encloses to the north the vale of Taunton, which is occupied by the new red sandstone, and is watered by the Tone. Among the eminences of this range are Barrow hill, north-west of Frome; Roddenbury hill, near Longleat park; Long Knoll (chalk); and the site of Alfred's tower, south of Frome in Selwood; Mary's down, near Shepton Mallet; Lamyat beacon, near Bruton; Ash beacon, near Milborne port; Hamdon hill and St. Michael's hill, between Ilchester and Crewkerne; Shave Lane hill, near Crewkerne; and Buckland down, Staple hill, and the Black Down hills (green sand and chalk marl), south of Taunton. Good freestone is quarried in the inferior oolite near Shepton Mallet, and at Norton-under-Hamdon, between Ilchester and Crewkerne; and the lias is much used for building cottages in the neighbourhood of Ilchester.

The Mendip hills are a distinct range stretching from west by north to east by south, and separated from the hills about Bath and Bristol by the narrow valley of the Yeo or Yatt, a small stream which flows into the Bristol Channel near Weston. They extend at their western end to the coast, and unite at their eastern extremity with the hills near Frome. The length of the Mendips may be estimated at 30 miles, their breadth between Stoke Rodney and West Harptree at 6 or 7. 'This chain consists of a central axis of old red sandstone, flanked on its opposite declivities by parallel bands of mountain limestone, dipping from it in opposite directions in angles varying from 30° to 70°. This central axis is not however visible throughout its whole course, being occasionally overarched and concealed by the calcareous strata; but it appears in four ridges, forming the most elevated points of the chain, and disposed at nearly equal distances through its length. The cavern of Wokey hole and the defile of Cheddar cliffs, with its long line of stupendous mural precipices, certainly among the most magnificent objects of this kind in Britain, are the well-known features of this chain.' (Conybeare and Phillips.) The cavern at Wokey, or Wookey, is not in the mountain limestone but in the calcareo-magnesian formation which abuts against it, near the foot of the chain, on every side: of English caverns it yields in extent only to those of the Peak in Derbyshire. It is described in Dr. Maton's 'Observations on the Western Counties,' vol ii., p. 136, &c. The mineral treasures of the Mendips are important; zinc and calamine are obtained abundantly in the central and western part of the range. Lead was formerly procured; but the works, from the exhaustion of the ore, or the difficulty of procuring it, have been given up. There are numerous coal-pits in the villages which lie north-west of Frome. The argillaceous beds of this coal-formation have been remarkably contorted, apparently by the force which elevated the adjacent harder rocks (mountain limestone and old red sandstone) in mass. The coal-seams are all thin, hardly any exceed three feet; nor could they be profitably worked, but for the highly improved state of the machinery. The Mendips rise in some parts to more than 1000 feet. Their principal summits are—Worle hill, near Weston-super-Mare; Banwell hill, Sandford hill, Dolberry warren, and Burrington Ham, between Worle and Blagdon, overhanging the valley of the Yeo, north of the chain; Bleadon hill, Wavering down, and Shute shelve hill, overhanging the valley of the Ax, below Cheddar; Black down (old red sandstone), in the axis of the range, north of Cheddar; West hill, North hill, and Egar hill (all in the old red sandstone), between Cheddar and Chewton Mendip; Pen hill (old red sandstone) and Milton hill, north of Wells; and Maesbury castle and Beacon hill (both old red sandstone), north of Shepton Mallet.

The long low ridge of Pawlet or Polden hill and the connected hills is an offset from the eastern hills between Castle Cary and Ilchester. It extends about 20 miles in a direction parallel to the Mendips, from which it is separated by a wide intervening fenny flat, drained by the Brue, and comprehending East Sedgemoor and the adjacent moors. Among the higher points of this range, which consists of lias resting on the new red marl or red sandstone, are Kingweston down, Butleigh hill, Dundon beacon (350 feet), Moorlynch (330 feet), Cock hill, and Ball hill. Some detached knolls of lias, and a tract of new red marl crowned with some lias, or oolitic eminences, rise out of the fens between the Polden and the Mendip hills; such as Brent knoll, near the sea, and Glastonbury Tor, or Chalice hill, near Glastonbury. Gypsum occurs abundantly in the red marl on the south side of Polden hill near Somerton.

In the western part of the county, running north-west from the neighbourhood of Taunton to Bridgewater bay in the Bristol Channel, bounding the valley of the Parret after the junction of the Tone, are the Quantock or Quantox hills. They consist of an elevated mass of a coarse gritstone (with some portions of killas), and belong to the slate formation which overspreads the north of Devonshire, separated however from the principal slate district by an intervening tract of new red sandstone, which formation nearly surrounds the foot of the range. At the northern foot of the hills lias occurs, covering both the red sandstone and the slates. The principal summits of the Quantock range are—Thorncombe barrow, Harley beacon, Dowsbury or Dansborough (1022 feet), Fire beacon, Bagborough station or Will's-neck (1270 feet), Cothelston lodge (1060 feet), and Buncombe hill. The length of the Quantock hills is about 14 miles. Their greatest breadth is about 5 or 6 miles, or, including the hills which are thrown off from the principal range toward the bank of the Parret, about 9 or 10 miles. Limestone is procured in the hills, and gypsum in the new red marl formation of the adjacent coast, near Watchet. Some veins of copper have been found and worked, but with little advantage.

The greater part of the county west from the narrow tract of new red sandstone which separates the Quantock hills from the principal district of the slate rocks, is occupied by an irregular hilly district, forming part of the wild moorlands of Exmoor forest, extending into the two counties of Devon and Somerset. This hilly district is bounded on the south by the valley of the Tone, and on the north by the Bristol Channel. It is occupied by the slate rocks of the Devonian range; but in some of the valleys near the coast these are covered by the rocks of the new red sandstone group. The principal eminences are—Oare hill, Porlock hill, North hill (824 feet), Grabbist hill (906 feet), Croydon hill, and Old Cleeve hill, near the coast; and Ox-Head hill, Dure down, Ashcombe hill, Span head, Shear down, Black Barrow down, Lucott hill, Dunkerry beacon (1668 feet), Winsford hill, Exton hill, Lype hill, and Brendon hill (1210 feet) more inland. Slate is quarried in these hills near Wiveliscombe.

The measurements of heights given above are from the Ordnance Survey, except Doucebury, North hill, and Grabbist hill, which are given by Mr. Leonard Horner, and Brendon hill, which is given by Mr. S. Woods. The latter gentleman has estimated North Hill at 1000 feet, and Dunkerry Beacon at 1784 feet.

There are mineral springs at Bath, Glastonbury, Alford, near Castle Cary, and Queen Camel, near Ilchester. Most, if not all of these, are found in a stratum of marl between the lower oolite and the lias formations. Others are enumerated by Collinson, in his *History of Somersetshire.*

The coast from the mouth of the Avon (which separates Gloucestershire from Somersetshire) runs about 15 or 16 miles south-west to Sand Point. For about 2 miles from the mouth of the Avon, it is low and marshy, but at Portishead point, near the village of Portsihead, the coast rises, and low cliffs skirt the shore, with one or two slight intervals, for 7 miles to the quiet watering-place of Clevedon. Between Portishead and Clevedon is a continuous range of hills, formed by an outlying mass of mountain limestone and old red-sandstone, separated from Leigh down by a low marshy valley; the cliffs are formed on the side of these hills. For nearly 5 miles beyond Clevedon the shore is lined with the marshes through which the Yow or Yeo and some other small streams flow into the sea; but between St. Thomas's head and Sand point is a range of cliffs of about a mile in length, worn in the face of a mountain-limestone hill. From Sand point the coast runs southward to Brean down, a hill of mountain limestone, precipitous on every side, and surrounded by the sea except just at its eastern end, where a marshy flat connects it with the mainland. Between Sand point and Brean down, which are distant nearly 5 miles in a straight line, the coast forms two bays, Sand bay and Uphill bay, separated by the intervening cliffs of Anchor head. This headland is the extremity of Worle hill, one of the Mendips, composed of mountain-limestone, on the sides of which the magnesian or conglomerate limestone rests, and upon this the lias. The two bays are filled with sand, dry at low-water; on Uphill bay, just at the foot of Anchor head, is the little watering-place of Weston-super-Mare.

Between Brean down and Little Stoke point, which is distant from Brean down 10 miles in a direct line south-west, is the bay usually called Bridgewater bay, although the town of Bridgewater lies some miles up the Parret inland. The coast from Brean down runs about 7 miles almost in a direct line due south to the æstuary of the Parret, forming one side of the bay, and then gradually turning westward runs about 7 or 8 miles in an irregular line to Little Stoke point. The greater part of the shore of the bay is formed by sand hills, bounding the marshes which extend between the Mendip hills and the lower offsets of the Quantock range. Polden hills and the detached knolls which rise out of this flat do not, any of them, reach the shore. This flat district appears to have been once covered by the sea, but not within the period of authentic history. Toward the western extremity of the bay, between Catsford and Little Stoke point, the coast is higher, and is lined for the last 3 miles of its extent by lias cliffs; where the lower Quantock hills abut on the sea, at Little Stoke point, the cliffs are interrupted by a very narrow interval of marsh land, through which a small stream flows into the sea.

From the extremity of Bridgewater bay the coast runs westward 25 miles to the boundary of the county. For the first 9 miles, to the little watering-place of Blue Anchor, it continues to be lined by the lias cliffs of the Quantock range, with one or two trifling interruptions. These cliffs sometimes rise to the height of 100 feet (Conybeare and Phillips) or even 200 feet. (Collinson, *Hist. of Somerset.*) From Blue Anchor to Minehead, about 4 miles, the coast, which forms a shallow bay, is lined with marshes; at the back of which, about a mile inland, Grabbist hill rises. From Minehead to Bossington point, 5 miles, are lofty cliffs, formed in the face of the slate rocks of North hill. At Bossington point the cliffs cease, and the eastern side of the shallow bay of Porlock, which is 5 miles between its extremities, is formed by a low shore: but the cliffs reappear on the western side of the bay, and continue nearly to the boundary of the county: these last cliffs are formed in the slate-rocks of Oare and Porlock hills. The coast is lined, with very little interruption, by sands, but, excepting in Sand bay, Uphill bay, and Bridgewater bay, they have little breadth. These three bays are filled up with sand, dry at low-water, except in the channel of the Parret: the sands in Bridgewater Bay have in one part a breadth of three miles. The only islands are Stert island and Fenning's island, in the marshes at the mouth of the Parret; and Flat Holm (magnesian or conglomerate limestone) and Steep Holm (mountain limestone) in the midst of the Bristol Channel. These two islands are both girt with cliffs: there is a lighthouse on Flat Holm opposite Brean down. The only harbours of any importance are formed by the rivers Avon and Parret. The roadstead of King's Road is at the mouth of the Avon. Some shipping trade is carried on from the towns of Porlock, Minehead, and Watchet.

Hydrography, Communications, &c.—The general direction of the rivers is to the north-west: the only material exception is in the case of the Tone and the upper part of the Bristol Avon. The larger rivers (except the Tone) rise in the adjacent counties, and pass through the depressions which break the continuity of the border hills.

The Avon, distinguished from the Warwickshire river so called, by the title of the Lower Avon, rises in Gloucestershire, on the eastern slope of the Cotswold hills, and flows through Wiltshire by Malmsbury, Chippenham, Melksham, and Bradford; below which it reaches Somersetshire, and has a farther course, on or within the border of the county, of 31 miles into the Bristol Channel or æstuary of the Severn at King's Road. Its course to the border of the county is for the most part southward; but after that it flows northwest by Bath, having a winding course between the oolite and mountain limestone hills of the north-eastern border. It is navigable up to Bath (where the Kennet and Avon canal locks into it) for barges, and to Bristol for sea-borne vessels, the largest class of which, owing to the great rise of the tide, reach the quays of the town without any difficulty, though it is 8 miles, following the winding of the channel, above its mouth. At the mouth of the Avon the spring tides usually rise 40 feet, and have been known to rise 50 feet.

The Avon receives the Frome, the Midford brook, above Bath, and the Chew at Keynsham. The Frome rises not far from Bruton, flows northward past the town of Frome, and joins the Avon between Bradford and Bath: its course (of about 20 miles) is within or upon the border of Somersetshire.

The Avon is connected with the Thames by the Kennet and Avon canal, of which a portion is in this county; it enters by the Dundas aqueduct over the Avon, and then follows the valley of that river to Bath. The Somersetshire coal canal is cut from the coal-works near Paulton into the Kennet and Avon canal on the border of the county: it is 9½ miles long. Connected with this canal is a railway from the adjacent coal-works at Radstock. Acts were obtained some years since for a canal to connect the Dorsetshire Stour at Blandford Forum with the Avon: it was to follow the valley of the Frome, but was never executed.

The Yow or Yeo rises at Compton Martin on the northern side of the Mendip Hills and flows north-west 14 miles between them and Broadfield Down into the Bristol Channel. The Axe rises in Wookey Hole or Cavern, on the southern side of the same hills, near Wells, and flows north-west 22 miles through the flat at their foot; it is navigable to the village of Lower Weare, near Axbridge, about 11 miles above its mouth, following the natural channel of the river; but this distance has been shortened to 9 miles by one or two cuts.

The Brue rises on the slope of the chalk marl and green-sand hills on the border of Somerset and Dorsetshire, and flows westward by Bruton and Glastonbury, 25 miles through the marshy flat between the Mendip and the Polden Hills into the æstuary of the Parret. It is not navigable; but the lower part of its course is included in the Glastonbury navigation, for which an act was obtained A.D. 1827. The navigation from Glastonbury to the Brue is by a canal running nearly parallel to the river.

The Parret, anciently the Pedred, the principal river in the county, rises in the chalk downs at South Perrot, near Beaminster in Dorsetshire. It reaches the border of Somersetshire about a mile from its source, and flowing northward for 13 miles, traverses the oolite border hills by a depression near Crewkerne and passes by South Petherton to Langport, receiving the Isle or Ile on its left bank, and the Yeo or Ivel on the right. From Langport the Parret flows north-west 12 miles, through a marshy flat to Bridgewater, receiving midway between that town and Langport the Tone on the left bank. Below Bridgewater the Parret has a winding course of 16 miles into Bridgewater Bay, in the British Channel, receiving the Cary on its right bank, and uniting just at its outfall with the Brue. The whole course of the river is thus about 41 miles; but the computation would be considerably higher were the Tone or the Yeo regarded as the principal stream.

The Isle or Ile rises in the slope of an outlying chalk hill between Chard and Crewkerne, and flows north and north-west 15 or 16 miles into the Parret, through meadows which cover the lias formation. It passes near Ilminster, but not through it. The Yeo or Ivel rises amid the oolite border hills near Milborne Port; and flows south and south-west and then north-west 11 miles, through a valley amid the oolite hills, past Sherborne in Dorsetshire to Yeovil, receiving several streams from the Dorsetshire chalk downs on the left bank. From Yeovil it flows 7 miles in a circuitous course north-north-west to Ivelchester or Ilchester, and from thence 7 miles west-north-west, making 25 miles in all, into the Parret at Langport. All this part of its course is through marshes, which cover the lias and new red-sandstone formations. The Tone rises in the southern slope of Brendon hill, and flows 10 miles south to the border of Devonshire; its course thus far is through the hills of the slate formation in which it rises. It then turns eastward and flows 23 miles through the new red-sandstone formations of the vale of Taunton, past the town of Taunton into the Parret. The Cary rises in the oolite border hills near Castle Cary, and flows westward through the lias and new red-sandstone, and through the marshes which cover them, into the Parret; its whole course is about 30 miles.

The navigation of this system of rivers commences at Ilchester on the Yeo, which is navigable for 7 miles into the Parret at Langport; this is sometimes called the Ivelchester and Langport Canal. A little above Langport the navigation of the Parret commences, and continues to the mouth of that river. Ships of 200 tons can get up to Bridgewater. The Tone is navigable from Taunton to its junction with the Parret, ten or eleven miles. The Carey is not navigable.

It was intended to make a canal from Morgan's Pill in the Avon six miles below Bristol, to the neighbourhood of Taunton, where it was to unite with the intended 'Grand Western Canal' from Exeter. There were to be two branches, one to the coal-works at Nailsea, and one to Axbridge and Cheddar. The act was obtained, A.D. 1811, and the project taken up with apparent spirit; but thirteen years afterwards (A.D. 1824) another act was obtained, abandoning the greater part of the line, retaining only the portion between Bridgewater and Taunton, which has been made. A branch to Chard is in progress if not finished. The Grand Western Canal was designed to follow the valley of the Tone from the border of the county to Taunton. Acts were obtained A.D. 1796, 1811, and 1812; but the canal has never been executed. The English and Bristol Channels ship canal was to cross the county by Chard and Bridgewater, but this undertaking, for which an act was obtained A.D. 1825, has been given up.

The river Exe has its source and the upper part of its course in the western extremity of Somersetshire, to which some of its first affluents belong, but the river belongs chiefly to Devonshire.

The two principal coach roads from London to Bristol (one by Calne and Chippenham, the other by Devizes and Melksham) enter the county near Bath, before reaching which city they unite; the road from Bath to Bristol through Keynsham is wholly in this county. The mail-road from London to Exeter through Salisbury crosses a corner of the county between Shaftesbury and Sherborne, and re-entering it beyond Sherborne, passes through Yeovil, Crewkerne, and Chard. The Falmouth mail-road by Amesbury enters the county between Mere (Wilts) and Wincanton, and runs through Ilchester and Ilminster. A road from Bristol runs by Axbridge to Bridgewater, from whence one road leads near the coast by Watchet, Dunster, and Minehead to Porlock, and from thence to Ilfracombe in Devonshire; a second by Milverton and Wiveliscombe to Barnstaple, Devon; and a third to Taunton, and from thence either by Wellington and Cullumpton (Devon) or by Honiton (Devon) to Exeter. A road from Bath leads by Wells and Glastonbury to Taunton; and roads from Bristol and Bath unite at Shepton Mallet, and proceed by Castle Cary and Yeovil to Dorchester. The road from London by Devizes and Trowbridge to Frome enters the county a little beyond Trowbridge. From Frome a road leads on one hand to Shepton Mallet, Glastonbury, and Taunton; and on the other to Bruton, Castle Cary, and Ilchester.

The Great Western railway, now open throughout the whole line, enters the county near Bath, and runs by Bath to Bristol, where it is connected with the Bristol and Exeter railway. The Box tunnel, near Bath, is close on the border of this county. The Bristol and Exeter railway commences at Bristol, and runs south-west between Leigh down and Broadfield down through the Nailsea coal-field, where there is a short branch to Weston-super-Mare; its course is then south by Bridgewater to Taunton, where it inclines to the south-west, and passes by Wellington into Devonshire. There is one tunnel just on the border of the county, under White Ball hill, between Wellington and Cullumpton. This railway is open from Bristol to Bridgewater.

Agriculture.—The county of Somerset possesses a soil and climate well suited to the growth of wheat and all the agricultural produce usually raised in any part of England. The hills do not rise to any great height, and are mostly cultivated or in profitable pasture. There is a fair proportion of woodland without any extensive forests. In some of the vales, such as the extensive vale of Taunton, the soil is of a rich nature, and the wheat which is produced there is of superior quality, so as to be much sought after for sowing in other parts of the country. Excellent butter and cheese are made where the land is better adapted to pasture. The Cheddar cheese, which from its superior quality, gives its name to a great portion of the cheese made in the county, is reckoned by many to be the best cheese made in England, from pure milk without any addition of cream: the real Cheddar cheese is consequently scarce, and bought up as soon as it is made.

The cows are mostly of the Devon breed; but many short-horns are also to be found in the dairies. The oxen fatted are either Devons or Herefords and short-horns. Many of the landed proprietors have farms in their own hands, and show their tenants an excellent example in the choice of their cattle and sheep, and in introducing improvements in the cultivation of the soil, so that the state of agriculture has greatly improved within a few years: better implements are used, and more profitable rotations of crops are introduced than in the old triennial system.

The sheep on the best lands are of the Leicester or South Down breeds, with crosses between these and the Cotswold sheep, which increases their size. Some Dorset ewes are kept for early lambs, which are fatted for the Bath and Bristol markets. The railway which now traverses the county will probably increase this species of industry.

There are a few hops grown in the county, but no very extensive hop-gardens; nor is there much cider made, although there are some good orchards.

Many hogs are fatted, and very good bacon is cured; the breed of pigs is like the Hampshire and Berkshire, which have of late years been improved by crosses with the Essex and Neapolitan breeds. Greater attention is paid to the breed of pigs than formerly.

The farm horses are generally strong and active; and although some heavy waggons and old-fashioned ploughs are still met with, light carts and ploughs begin to be appreciated and gradually supersede the old implements. Somerset is decidedly improving in its agriculture, and keeps pace with the progress which is visible throughout the whole kingdom. There are many important fairs in the county. The principal are:—

Ashbrittle, Feb. 25, Oct. 15; Ashcott, Jan. 9; Ashill, Easter Wed., Sept. 12; Axbridge, Feb. 5, Mar. 25, June 11, Oct. 28; Backwell, Sept. 21; Bagber-West, May 12; Banwell, Jan. 18, July 18; Bath, Feb. 14, July 10; Binegar, Whit-Wed. and Th.; Bishop Lydeard, April 5, Sept. 9; Blagdon, last Fri. in Aug.; Bridgewater, 2nd Th. in Lent, June 24, Oct. 2, 3, Dec. 28; Bristol, Mar. 1, Sept. 1; Broadway, Sept. 14; Broomfield, Nov. 13; Bruton, April 23, Sept. 17; Buckland, Oct. 10; Buckland St. Mary, Sept. 21, 22; Burnham, Trinity-Mon.; Castle Cary, Tu. after Palm Sun., May 1, Whit-Tu.; Chard, 1st Wed. in May, Aug., and Nov.; Cheddar, May 4, Oct. 29; Chesilborough, last Th. in Oct.; Cockhill, Jan. 8; Coombe St. Nicholas, June 19, 1st Wed. after Dec. 10; Congresbury, Sept. 14; Crewkerne, Sept. 4; Crowcombe, 1st Fri. in May, Mon. after Aug. 1, Oct. 31; Curryrivel, last Wed. in Feb., first Mon. after Lammas-day; Decuman's, St., Aug. 24, Sept. 17; Dulverton, July 10, Nov. 8; Dundry, Sept. 12; Dunster, Mon. in Whitsun-week; Draycot, Sept. 10; East Brent, Aug. 28; Freshford, Sept. 6; Frome, Feb. 24, July 22, Sept. 14, Nov. 25; Glastonbury, Wed. in Easter week, Sept. 19, Oct. 11; Hinton St. George, April 23; Holloway, May 14; Huntsfield, June 29; Ilchester, Mon. before Palm-Sun., July 2, Aug. 2; Ilminster, last Wed. in August; Ivelchester, Mon.-fortnight before Easter, July 2, Aug. 2; Keynsham, Mar. 24, Aug. 15; Kilmington, Aug. 29; Kingsbrompton, Wed. before Holy Th., Th. se'nnight after Oct. 10; Langport, Mon. before Lent, 2nd Wed. in Aug., 2nd Mon. in Sept., last Mon. in Nov.; Langridge, Aug. 2; Lansdown, Aug. 10; Lifford Green, Holy Th., Aug. 12; Limpsham, April 25; Lyng, last Mon. in Aug.; Martok, Tu. before Whit-Sun., Aug. 10, Sept. 15; Martock, 2nd Th. in Oct.; Milborne Port, June 5, Oct. 28; Mells, Mon. after Trinity, Sept. 29; Midsummer Norton, April 25; Milverton, Easter-Tu., July 25, Oct. 10; Minehead, Wed. in Whitsun-week; Moorlinch, Aug. 20; Montacute, May 9, Sept. 27; North Curry, 1st Tu. in Sept.; North Petherton, May 1, Nov. 7; Nunny, Nov. 11; Otterford, Nov. 28; Pensford, May 6, Nov. 8; Petherton, July 6; Phillips Norton, Mar. 21, 27, May 1, Aug. 29; Pilton (near Shepton Mallet), 1st Mon. after Sept. 10; Portlock, Th. before May 12, October 9, Nov. 12; Portbury, Whit-Mon.; Preddy, Aug. 21, 22; Queen Camel, Trinity Th., Oct. 25; Redlyach, June 29; Road, Mon. after Aug. 29; Ruishton, Whit-Mon.; Samford Arundel, Wed. before Easter, 3rd Tu. in Sept.; Shepton Mallet, Fr. after Whit-Mon., Aug. 8; Snowdon, Whit-Th.; Somerton, Tu. in Passion-week, 3rd, 6th, 9th, and 12th Tu. after, Sept. 30, Nov. 8; South Brent, Oct. 10; South Petherton, July 6; Stavordale, Aug. 5; Stoford, June 11, Sept. 28; Stogursey, May 2, Sept. 12; Stogumber, May 6, Aug. 1; Stoke-under-Hamden, April 25; Stowey, Sept. 18; Stucklebridge, Fr. before Holy Th., Wed. after Oct. 17; Taunton, June 17, July 7, 8, 9; Ubley, Oct. 4; Watchet, Nov. 17, Aug. 23; Wedmore, Aug. 2; Wellington, Th. se'nnight before Easter, Holy Th.; Wellow, May 20, Oct. 17; Wells, Jan. 3, May 14, July 6, Oct. 25, Nov. 30; West Pennard, 1st Mon. in Aug.; Weston Zoyland, Sept. 10; White Down, Whit-Mon. and Tu.; Williton, Trinity-Mon.; Wincanton, Easter-Tu. and Michaelmas-day; Winsham, Whit-Wed.; Wiveliscombe, last Tu. in Feb., May 12, Sept. 25, last Sat. in April; Woolavington, Oct. 18; Wootton Courtney, Sept. 19; Yarlington, Aug. 26; Yeovil, June 28, Nov. 17.

Divisions, Towns, &c.—The county of Somerset is divided, according to Collinson (*Hist. of Somersetshire*), into forty hundreds and seven liberties; but in the Population Returns (1831) two of the hundreds are united with others, and two of the 'liberties' are given as hundreds; thus keeping the number of hundreds forty. The remaining liberties are not noticed. The towns of Bath, Taunton, and Bridgewater, which are given separately in the Population Returns, we have included in the hundreds in which they are respectively situated.

Name of Hundred.	Situation.	Area in Acres.	Pop. in 1831.
Abdick and Bulstone	Central	38,070	11,231
Andersfield	Central	10,950	2,764
Bath-Forum (including the City of Bath)	N.E.	16,530	59,172
Bempstone	N.W.	24,530	7,328
Brent with Wrington	N.W. & Central	18,210	4,828
Bruton	E.	14,250	4,490
Cannington	N.W.	25,480	5,695
Carhampton	W.	60,350	8,102
Catsash	Central	25,340	7,516
Chew and Chewton	Central	46,700	17,932
Crewkerne	S.	13,260	6,847
Curry (North)	Central	12,940	4,211
Frome	E.	32,900	19,874
Glaston-twelve-hides	Central	24,610	6,366
Hampton and Claverton (liberty or hundred)	N.E.	2,610	597
Hartcliffe with Bedminster	N.	19,440	17,047
Horethorne	S.E.	26,370	7,663
Houndsborough, Berwick, and Coker	S.	18,890	8,161
Huntspill and Puriton	N.W.	6,800	2,012
Keynsham	N.	24,520	9,029
Kilmersdon	Central	15,400	6,629
Kingsbury (East and West)	S.W. & S.	36,690	19,962
Martock	Central	6,930	2,841
Mells and Leigh (liberty or hundred)	Central	4,720	1,899
Milverton	S.W.	15,250	4,634
Norton Ferris	E.	18,730	5,092
Petherton (North), including Bridgewater	Central	26,730	13,697
Petherton (South)	S.	14,660	6,267
Pitney	Central	3,690	1,923
Portbury	N.	23,980	9,333
Somerton	Central	25,450	5,452
Stone	S.E.	10,720	7,433
Taunton and Taunton Dean, including the borough of Taunton	Central	43,240	22,427
Tintinhull	Central	7,450	4,492
Wellow	N.E.	21,900	8,974
Wells-Forum	Central	30,090	11,420
Whitestone, or Whitstone	Central	33,150	12,412
Whitley	Central	49,640	12,794
Williton and Freemanners	W.	114,870	14,717
Winterstoke	N.W. & Central	62,030	19,511
		1,028,090	402,776
Militia under training			1,424
			404,200

Liberties, enumerated by Collinson.

Hampton and Claverton.

Mells and Leigh.—These are enumerated above as hundreds.

Easton and Amrill, included in Bath-Forum hundred.

Hinton and Norton, included in Wellow hundred.

East Cranmore, included in Frome and Wells Forum hundreds.

Hill-House, included in Frome hundred.

Witham Friary, included in Frome hundred.

Somersetshire contains the cities of Bath and Wells, and a part of the city of Bristol; the parliamentary boroughs of Taunton, Bridgewater, and Frome; the municipal (but not parliamentary) boroughs of Axbridge, Chard, Glastonbury, Ilchester, Langport, Milborne Port, and Yeovil; and the market-towns of Bruton, Castle Cary, Crewkerne, Dulverton, Dunster, Ilminster, Milverton, Minehead, South Petherton, Shepton Mallet, Somerton, Watchet, Wellington, Wincanton, and Wiveliscombe. To these may be added, as places of some consequence, Bedminster, Backwell, Brislington, Long Ashton, Nailsea, Clevedon, Pill, and Keynsham, all near Bristol; Bathwick, Lyncomb and Widcomb, Bath-Easton, Weston, and Twiverton, all near Bath; Beckington and the other villages supported by the woollen manufactures near Frome, and the villages in the Mendip coal-field south-west of that town; North Petherton and Huntspill, near Bridgewater; Cheddar, Banwell, Burnham, Wedmore, Wrington, and Congresbury, near Axbridge; Merriott, near Crewkerne; East Coker, Montacute, Stoke under Hamden, and Martock, near Yeovil; Curry Rivel, near Langport; Porlock and Old Cleeve, near the Bristol Channel; Stogumber between Watchet and Taunton; and Weston-super-Mare on the sea, between Bristol and Bridgewater. Several of these are given in their respective articles [AXBRIDGE; BATH; BRIDGEWATER; BRISTOL; CHEDDAR; FROME; TAUNTON; and WELLS]; the others we notice here, giving first the towns in alphabetical order, and the other places according to their locality. All distances from London are measured from the General Post-office.

Bruton is in Bruton hundred, on the river Brue, from which it gets its name, 112 miles west by south from London by Andover and Amesbury, and 33 miles east by north from Taunton. The manor of Bruton (or, as it is written in Domesday, Briwetone) was held by the kings Edward the Confessor and William the Conqueror; and was granted by the latter to Sir William de Mohun, whose descendants founded here a priory for black canons, on the ruins of a more ancient Benedictine monastery. This priory, at the suppression, just before which it was made an abbey, had a yearly revenue of 480*l.* 17*s.* 2*d.* gross, or 439*l.* 6*s.* 8*d.* clear.

The town stands on the right bank of the Brue, which is here a small stream crossed by a stone bridge, and comprehends one main street, clean and well paved, with neatly built houses, and several smaller streets. The church, which is on the left bank of the river, is large; it comprehends a nave, chancel, side aisles, vestry, and two porches, partly of decorated English, partly of perpendicular architecture, with a pinnacled tower at the west end. Dr. Maton (*Observations on the Western Counties*) and Collinson (*Hist. of Somersetshire*) notice a second and more ancient tower on one side of the north aisle. There are no remains of the priory, which was near the church; some parts of it were incorporated in a mansion occupied by the Berkeley family, now pulled down. The town-hall contains a court-room, used for petty sessions; the lower part is used as a market-house. There are an Independent meeting-house, and a well endowed and commodious hospital or almshouse, founded by Hugh Saxey, or Sexey, auditor to Queen Elizabeth; the buildings of this hospital form a spacious quadrangle decorated with a statue of the founder in a niche on the south side.

The area of the parish is 3420 acres; the population, in 1831, was 2223, of which 2061 belonged to the town. The principal manufactures are of stockings and silk: in Leland's time the townsmen were 'much occupied with making of clothe.' The market is on Saturday, and there are two yearly fairs.

The living is a perpetual curacy, of the clear yearly value of 133*l.*, with a glebe-house: it is in the archdeaconry of Wells, in the diocese of Bath and Wells.

There were, in 1833, an endowed free grammar-school, founded by Edward VI., with 11 boys on the foundation and 20 others; Sexey's hospital-school, with 18 boys; and eight other day-schools, with 87 boys and 150 girls; and two Sunday-schools, with 93 boys and 110 girls.

Castle Cary is in the hundred of Catsash, 114 miles west by south from London, by Bruton, and 25 miles east by north from Taunton, by Langport and Somerton. It is called Cari in Domesday. The castle was built or strengthened by William Gouel de Percheval, lord of the place in the reign of Stephen; it was twice besieged in the civil wars of that reign, William de Percheval having taken arms against the king. The earthworks alone remain. Charles II. was in this town in disguise after the battle of Worcester.

The town is irregularly built; the principal street, which is partially paved, but not lighted, extends near a mile on the road to Ilchester; the houses are straggling, but neatly built. The small village of Almsford is so near as almost to form part of the town. Castle Cary church is handsome, and on an elevated site; it comprehends nave, chancel, side aisles, and an embattled western tower. Almsford church is small, but neat. There are Independent and Methodist meeting-houses.

The area of Castle Cary parish is 3640 acres; the population, in 1831, was 1758; Almsford has an area of 920 acres; the population was 364; together 4560 acres and 2122 inhabitants. The market, which is very small, is on Tuesday. There are three fairs and seven great cattle markets in the year.

The living of Castle Cary is a vicarage, of the clear yearly value of 311*l.*; that of Almsford is a rectory, of the clear yearly value of 257*l.*, with a glebe-house: both are in the archdeaconry of Wells, in the diocese of Bath and Wells.

There were in the two parishes, in 1833, seventeen day or boarding schools, with 121 boys and 121 girls; and five Sunday-schools, with 98 boys and 94 girls.

Chard is in the hundred of East Kingsbury, 141 miles west-south-west of London, by Salisbury and Shaftesbury, and 13 miles south-east of Taunton. It is written Cerdre in Domesday, at the compilation of which the manor was held by the bishop of Wells. It is asserted to have been a borough by prescription; it sent members to parliament in the reigns of Edward II. and III., but not since.

The town stands on the high ground on the south border of the county, and consists of several streets irregularly laid out, and lighted with gas: the houses are generally well built. The church, which is on the south side of the town, is a large and handsome cross-church; it comprehends a nave, chancel, side aisles, north and south transepts, and a low tower at the west end. The market-house, formerly used as the borough court-house, is an ancient building; so is the present town-hall, formerly a chapel. There are meeting-houses for Baptists and Independents.

The area of the parish is 5110 acres; the population, in 1831, was 5141. The manufactures are chiefly of lace and woollen cloth, in which nearly 500 men are employed: to the introduction of these manufactures the increasing importance of the town may be ascribed. The market is on Monday, it is noted for the sale of potatoes; there are three yearly fairs.

The corporation of Chard, under the Municipal Reform Act, consists of four aldermen and twelve councillors. The borough is not to have a commission of the peace, except on petition and grant. The corporation never possessed any jurisdiction. The limits of the borough comprehend nearly the whole town; and it is proposed to enlarge them so as to comprehend the whole: the borough is distinct from the rest of the parish, as respects the maintenance of the poor.

The living is a vicarage, of the clear yearly value of 486*l.*, with a glebe-house; it is in the archdeaconry of Taunton, in the diocese of Bath and Wells.

There were in the parish, in 1833, eight day-schools, one endowed with 10 boys, and seven others, with 110 boys and 105 girls; and three Sunday-schools, with 745 children of both sexes.

Crewkerne is in the hundred of Crewkerne, 135 miles from London, by Salisbury and Shaftesbury, and 19 south-east of Taunton. Crewkerne is written Cruche in Domesday, at the compilation of which it belonged to the king. The town consists of several streets meeting in the market-place, in the centre of which is a commodious market-house; the houses are generally well built. The church is a large cross church, with an embattled tower with pinnacles at the corners, rising from the intersection of the nave and transepts. It is lighted with large windows of perpendicular character, and is remarkable for a small room behind the altar, once used as a confessional. There are meeting-houses for Methodists, Baptists, and Unitarians.

The area of the parish is 5810 acres; the population, in 1831, was 3789. The principal manufacture is of sail-cloth and sacking, which employs a number of hands; some dowlas and stockings are also made. There are a well attended corn-market on Saturday and one yearly fair.

The living is a perpetual curacy, of the clear yearly value of 148*l.*, in the archdeaconry of Taunton, in the diocese of Bath and Wells.

There were in the parish, in 1833, seven infant or dame schools, with 121 children of both sexes; a well endowed free grammar-school, with 14 boys; and six other day-schools (two of them with small endowments), with 80 boys and 79 girls; and four Sunday-schools, with 304 boys and 470 girls.

Dulverton is in the hundred of Williton and Freemanners, 167 miles west by south from London by Andover, Frome, and Bridgewater, and 24 miles west of Taunton. It was a royal manor at the compilation of 'Domesday,' in which it is called Dolvertune. The town stands in a deep valley, watered by the Barle (a feeder of the Exe), over which there is a stone bridge of five arches. The hills round are richly wooded. The town consists of two well-paved streets, with channels of water running through them: the houses are mostly well built. The church is an antient building, comprising nave, chancel, and two side aisles, with an embattled tower, 60 feet high, at the west end. There is an Independent meeting-house.

The parish has an area of 7760 acres, and had, in 1831, a population of 1285. The silk manufacture is carried on on a small scale. The market is on Friday, and there are two yearly fairs.

The living is a vicarage, in the archdeaconry of Taunton, in the diocese of Bath and Wells, of the clear yearly value of 322*l.*, with a glebe-house.

There were in the parish, in 1833, five infant or dame schools, with 37 boys and 49 girls; two day-schools (one endowed) and one boarding-school, with 59 boys and about 30 girls; and two Sunday-schools, with about 124 children.

Dunster is in the hundred of Carhampton, 165 miles west by south from London through Frome and Bridgewater, and 21 miles west-north-west of Taunton. The West Saxon kings had a fortress here during the period of the Heptarchy. It was called Torre (tower), by which name it appears in 'Domesday,' where the manor is said to belong to William de Moion (or Mohun), who had his castle here. This castle afterwards obtained the name of Dunes-torre (tower on the downs), now Dunster. The De Mohuns supported the empress Maud against Stephen. In the reign of Edward III. the castle passed by sale, on the failure of the male line of the De Mohuns, to the Luttrell family, by which it is still held. It was a military post of the Royalists in the civil war of Charles I., and was afterwards the place of confinement of Prynne. Dunster sent members to parliament as early as the time of Edward III., and was in later times united in the exercise of the franchise with the adjacent borough of Minehead, until its disfranchisement by the Reform Act. There was a Benedictine priory here, founded by the De Mohuns, a cell of the abbey of St. Peter at Bath: its yearly revenue at the suppression was 37*l.* 4*s.* 8*d.*

The town stands at the eastern foot of Grabbist Hill, at the end of a narrow valley which here opens upon the Bristol Channel, the shore of which is a mile north-east of the town. A small stream which drains the valley runs near the town, and is crossed by a stone bridge of three arches. There are two principal streets, at the southern end of one of which is the castle, a building of the Elizabethan period and style, having behind it a richly wooded park, commanding a beautiful and extensive prospect. The church is a fine spacious building of perpendicular architecture, built in the reign of Henry VII. It consists of a nave, chancel, and aisles, west of the central tower, and a disused portion east of it. Before the suppression of the priory (which was adjacent to the church, and of which some remains still exist), in consequence of a dispute between the parishioners and the monks, the eastern part of the church was separated for the use of the monks, since whose time it has been neglected: it contains several monuments of the De Mohuns and Luttrells. There is an old market house in the town.

The parish of Dunster contains 2500 acres: the population, in 1831, was 963. The market is on Friday, and there is one yearly fair.

The living is a perpetual curacy, in the archdeaconry of Taunton, in the diocese of Bath and Wells, of the clear yearly value of 130*l.*

There were in the parish, in 1833, an endowed day-school, with 30 children of both sexes; another day-school with 21 boys and 17 girls: and one day and Sunday school, supported by contributions, for 30 girls.

Glastonbury is in the hundred of Glaston-twelve-hides, 127 miles west by south from London by Amesbury, Frome, and Shepton Mallet, and 22 miles east-north-east from Taunton. The eminence on which the town stands is nearly insulated by the surrounding marshy flats, and was called by the Britons 'Ynswytryn,' or 'Ynys-wytryn, the glassy island,' afterwards 'Avalon;' the meaning of the latter name is disputed, as well as the reason for which the former was given. Monkish legends ascribed the foundation of a Christian church on this spot, said to be the first in England, to Joseph of Arimathea, the supposed apostle of the British Islands; and a species of thorn, still existing in the neighbourhood, which blossoms in the winter, was long believed to have sprung from his walking-staff which he stuck in the earth. A monastery or abbey was certainly established here at an early period, in the precincts of which the semi-fabulous British chieftain Arthur was said to be buried. A leaden cross, bearing the following Latin inscription, 'Hic jacet sepultus inclitus rex Arthurus in insula Avallonia,' was found under a stone seven feet beneath the surface; and nine feet below this an oaken coffin, inclosing dust and bones, was discovered. Of this discovery, which took place in the time of Henry II., and is recorded by Giraldus Cambrensis, who was an eye-witness, there can be no doubt, though the genuineness of the remains has been questioned. Upon the establishment of the Saxons, the spot obtained a new designation, Glaestingbyrig, the first part of which appears to be the Saxon equivalent for its British name 'Wytryn.' The monastery, which had fallen into decay, was rebuilt with great splendour by Ina, king of Wessex (about A.D. 708), and the establishment, enriched by the liberality of successive princes, flourished till the period of the Danish incursions, under Ethelred I. and Alfred the Great, the West Saxon princes. Under the abbacy of the famous Dunstan [DUNSTAN, SAINT], and by the munificence of the Anglo-Saxon kings Edmund I. and Edgar, it regained its former prosperity, and was conformed to the rule of the Benedictines. At the Conquest, the abbot of Glastonbury was a personage of importance in the Anglo-Saxon state: but the jealousy of William, who deposed the abbot and substituted a Norman in his room, and stripped the abbey of many of its lands, depressed the establishment for awhile; but it was restored by the carefulness and influence of subsequent abbots. The buildings were in great part rebuilt in the reigns of Stephen and Henry II., and were subsequently repaired or enlarged. It became soon after this time a mitred abbey, and was for a short period annexed to the bishopric of Wells, which was during the interval called the bishopric of Glastonbury. At the time of the suppression, Richard Whiting, the abbot, who resisted the measures of Henry VIII., was, upon a charge of embezzling the conventual plate, tried, and hanged on the adjacent eminence of the Tor Hill, A.D. 1539. The yearly revenue at the dissolution was 3508*l.* 13*s.* 4¾*d.* gross, or 3311*l.* 7*s.* 4¼*d.* clear. Some idea of the extent and magnificence of the abbey may be formed from the statements given in Dugdale's 'Monasticon' (last edition) of the abbey's munificence, and from an enumeration, at the time of the suppression, of nearly eighty apartments, offices, &c. contained in the precincts, which included a space of 60 acres. The reputation of Glastonbury for sanctity did not cease at the Reformation. As late as A.D. 1750 and 1751, a number of invalids, to the number in one month (May, 1751) of ten thousand, flocked to Glastonbury in consequence of the account of a wonderful, not to say miraculous, cure wrought by drinking the water of a spring near the town. We are not told how long the delusion lasted.

The town consists of several streets: four of these inclose a quadrangular space, in which the ruins of the abbey are comprehended; and from the corners of this quadrangle other streets extend. The houses are generally low, and many of them have been built with the stones taken from the ruins of the abbey. The remains of this splendid structure consist of some fragments of the church, the chapel of St. Joseph of Arimathea, and what is called the abbot's kitchen. The ruins of the church, which was cruciform, comprehend two of the pillars which supported the central tower, some portions of the walls of the choir, and a fragment of the wall of the nave. The architecture belongs to the period of transition from the Norman to Early English, with some portions of later date. The whole length of the church was 380 feet, the breadth of the choir and its aisles 70. St. Joseph's chapel is in better preservation than the church, at the west end of which it is placed, and with which it communicates by an ante-chapel, of somewhat later date: both however belong to the same transition period as the church, but are of a more enriched character: the length of the chapel and ante-chapel together is 110 feet, the breadth 25 feet. The abbot's kitchen is a small building, square externally, but octagonal within: it is in a very perfect state, and belongs to the late perpendicular period. The roof is surmounted by a double lantern. Glastonbury has two parish churches, St. John and St. Benedict, both elegant structures in the perpendicular style, with graceful towers; and in the town are several buildings which were formerly dependencies of the abbey: the George Inn, one of these, offers a good specimen of late perpendicular. On a hill near the town is what is called 'the Tor,' a tower, which is the only remain of a chapel dedicated to St. Benedict. It is of the decorated English character, of beautiful though simple composition, and very perfect in its details. There are places of worship for Independents, Baptists, Wesleyans, and Quakers.

The area of the parishes, and their population, in 1831, were as follows:—

	Acres.	Pop. in 1831.
St. John	6107½ acres.	2591
St. Benedict . . .	1109	403
	7216	2994

Some hosiery and coarse gloves are manufactured. The market is on Saturday, and there are four yearly fairs.

The municipal borough comprehends nearly the whole of the two parishes; but it is proposed to contract the limits. The town was incorporated in the reign of Anne, from whom it received its only charter. The Municipal Reform Act assigns to it 4 aldermen and 12 councillors; it is not to have a commission of the peace, except on petition and grant. Glastonbury is not a parliamentary borough.

The living of St. John is a perpetual curacy, to which the chapelry of St. Benedict is united: their joint yearly value is 175*l.*, with a glebe-house: they are in the diocese of Bath and Wells, and, with several adjacent parishes, constitute the peculiar jurisdiction of Glaston.

There were in the two parishes, in 1833, one infant school, with 50 boys and 41 girls; nine boarding or day schools (seven of them partially supported by endowment or subscription), with 80 boys, 41 girls, and 85 children of sex not stated; and three Sunday-schools, with 140 boys and 150 girls.

Ilchester or Ivelchester (from the river Ivel or Yeo, on which it stands) is in the hundred of Tintinhull, 124 miles west by south of London by Andover and Amesbury, and 22 miles east of Taunton by Langport. This town is of great antiquity: the British name is given by Nennius as Caer Pensavelcoit, which is said to signify 'the city at the head of the river's mouth in the wood:' it was the Ischalis of the Romans, mentioned by Ptolemy, who writes it 'Ischalis,' as one of the chief towns of the Belgae. The Roman town was defended by a wall and deep ditch, comprehending an oblong quadrangle, through which the Foss way [Foss] passed from north to south. The ditch and the foundations of the wall may be traced in many places, the latter consisting of brick and stone work regularly mingled. Roman hypocausts and baths, tessellated pavements, urns, lachrymatories, paterae, fibulae, bracelets, and other relics of antiquity have been repeatedly discovered, and medals, especially of Vespasian, Trajan, and Antoninus Pius. 'Vast arches and immense foundations of antient buildings,' says Collinson, 'lie beneath the surface of the ground, and the entire site of the old city is filled with subterraneous ruins.' Some traces of the paved ford by which the Foss was carried across the river are still visible near the bridge. Under the Saxons, who called the place Givel-ceastre, it was a place of note, and at the time of the Domesday Survey contained 107 burgesses, who had a market. It was besieged without success, A.D. 1088, by the forces of the lords, who had espoused the claim of Robert of Normandie to the crown against William Rufus. It sent members to parliament in the reigns of Edward I. and Edward II., and in the reign of Edward III. the county courts and assizes were ordered to be held here, but the elective franchise was suspended till the reign of Edward IV., and then again suspended after a short interval till the reign of James I.: it was disfranchised by the Reform Act. There were three religious establishments in the town; an hospital called White Hall, subsequently converted into a nunnery, and then into a free chapel; a house for lepers, with a chapel annexed; and a house of Dominican or Black friars.

The town is in a rich valley, and may be considered as consisting of two parts, Ilchester proper and the village of Northover; these are separated by the river Yeo or Ivel, which is crossed by a stone bridge of two large arches. Ilchester proper consists of four streets of indifferently built houses; and there are some large piles of building, formerly inhabited in separate apartments by burgage tenants, for whom these dwellings were erected by the patrons of the borough. The church is an antient building, consisting of a nave, chancel, and north aisle or chapel, with a low octagonal tower, 'constructed,' says Collinson, 'of Roman stone.' The county gaol, which is still at Ilchester, though the assizes are no longer held here, is a spacious building of freestone from Hamden hill. The town-hall is a neat modern building at one end of the market-place, at the other end of which is a sun-dial with four faces, supported by a Doric pillar. There are some remains of the Dominican friary, used some years since as a silk-factory: those of White Hall were removed some time since.

The parish comprehends an area of 690 acres; the population in 1831 was 975, without reckoning the inmates of the county gaol; to this statement we may add 220 acres and 138 inhabitants for Northover: total 910 acres, 1113 inhabitants. The trade of the place is trifling; some women are engaged in the glove manufacture, of which Yeovil is the centre. The market has been discontinued, and two of the three yearly fairs are falling into neglect. The corporation still exists, but it exercises no jurisdiction, and is of little importance; it was not included in the Municipal Reform Act.

The living of Ilchester is a rectory, in the archdeaconry of Wells, in the diocese of Bath and Wells, of the clear yearly value of 98*l.*; that of Northover is a vicarage, of the clear yearly value of 105*l.*

There were in the parish, in 1833, two day-schools, with 62 children (31 boys and 31 girls), and two Sunday-schools, with 73 children (42 boys and 31 girls).

Ilminster is in the hundred of Abdick and Bulstone, 135 miles west by south of London by Ilchester, and 12 miles south-east of Taunton. It was a market-town at the time of the Domesday Survey, when it belonged to the Benedictine abbey of Micelenie, now Muchelney, near Langport, and was called Ileminstre. The town is in a low but pleasant situation, about a mile distant from the river Isle or Ile, from which it derives its name: it consists principally of two streets forming a cross; the longer of these extends nearly a mile from east to west: the houses are neat and well built. The church is a large cross church, in the centre of the town, and consists of nave, chancel, transept, north and south aisles, and porch; at the east end is a small vestry, formerly a chantry chapel. There is a handsome tower, at the intersection of the cross, of light and uncommon construction, crowned with twelve pinnacles. The general character of the architecture is perpendicular. There are meeting-houses for Wesleyans, Independents, and Unitarians; and a neat market-house.

The area of the parish is 4230 acres; the population in 1831 was 2957. The woollen-cloth and silk and lace manufactures are carried on in a small way, and there are some tan-yards and a considerable malt-trade. The market is on Wednesday, and there is one yearly fair.

The living is a vicarage, in the archdeaconry of Taunton, in the diocese of Bath and Wells, of the clear yearly value of 266*l.*, with a glebe-house.

There were in the parish, in 1833, one dame-school; a well endowed grammar-school, with 20 boys on the foundation and about 100 others; another school of 50 boys and 40 girls, supported from the same property as the grammar-school; a third endowed school, with 27 children of both sexes; and thirteen other day-schools, with 237 children of both sexes; and four Sunday-schools, with 340 children.

Langport is in the hundred of Pitney, 131 miles west by south from London, and 13½ miles east of Taunton. It was a borough at the time of the Domesday Survey, and was held of the king; it had 34 burgesses, and was called Lanporth. A severe encounter took place here in the civil war of Charles I. (A.D. 1645), between a Royalist detachment of Lord Goring's army and a Parliamentarian force: the Royalists were beaten with considerable loss.
